Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Another Weston Patent Sustained.

Patent No. 497,482 for shunts for Electric Light and Power Stations Sustained by his honor, Judge Holt, of the United States Circuit Court, Southern District of New York.

Extract from the opinion of the Court in the case of the WESTON ELECTRICAL INSTRUMENT CO. vs. EMPIRE ELECTRICAL INSTRUMENT CO.

"This is a suit to restrain the infringement of a patent, No. 497,482, dated May 16th, 1893, issued to Edward Weston, and now owned by the complainant, for a shunt for electric light and power stations. There are no questions as to jurisdiction, parties or title. **The proof of infringement is conclusive, and is not controverted.** . . . Prior to Weston's patent in 1893 no practical method for the use of a shunt in connection with the measuring instruments for such large currents had been found, although the necessity for such an instrument was thoroughly appreciated, **and many electricians all over the world attempted to invent one.** In actual practice, no shunt at that time was used. The measuring instrument was applied to the entire current, but the result was unsatisfactory. The measuring instruments were complicated, inconvenient and expensive, and the measurements which could be made by them were inaccurate and unsatisfactory.

"The essential problem in discovering a shunt which could be used with a powerful current was not electrical but thermal. . . . The instruments manufactured under Weston's patent **immediately entered into substantially universal use** in all large central electric power and light stations, and have ever since been used almost exclusively as ammeters for large electric currents. . . . All the shunts relied upon by the defendants were shunts which made no use of the methods which Weston used to dissipate the heat in case of a large current. **None of them had struck upon the idea of making the plates of high resistance short, so that the heat in them would be rapidly absorbed by the terminals, and none of them had hit upon the idea of making the terminals massive** so that they would radiate a large amount of heat rapidly from the plates of high resistance. **I think that Weston's patent not only embodies invention, but that it embodies invention of a very high and superior order. It adopted a method of dissipating heat which was not only novel, but was in line entirely opposite to the direction in which all other electricians had been working.** . . La Roche testified that he constructed in or about 1884 an instrument called a voltmeter, and a shunt, and that from 1884 until about 1888 or 1889, he used this shunt in connection with this voltmeter as a measuring instrument, for the purpose particularly of testing storage batteries, at his workshop in Germantown or Philadelphia. . . The evidence establishes, in my opinion, that the instrument called a voltmeter was formed by putting together a number of instruments or parts embodying different inventions, none of which had been made or was known to electricians before Weston applied for his patent; that it would have been a marvelous and almost impossible thing for the most skillful electrical inventor at that time to have devised such an instrument; that La Roche is a man not only without any scientific education, but without even the ordinary electrical knowledge of a skillful electrical mechanic; that his reputation for veracity is bad; **that his shunt never was used as a measuring instrument in connection with his voltmeter between 1884 and 1889; that the various pieces of apparatus constituting the voltmeter were put together by La Roche after the issue of the patent in suit to Weston, with the object of being used in support of his own untruthful testimony** to be given in this and other suits for the purpose of attempting to invalidate this and other patents issued to Weston; **that a part of the apparatus contained in the said voltmeter are two magnets, which are so arranged that their poles neutralize each other; that as a result it is impossible for a current of electricity in passing through the instrument to move the coil; that therefore the instrument is and always has been inoperative, and the shunt could not have been used as a measuring instrument in connection with it.** In short, I cannot avoid the conclusion that the testimony of La Roche in this case was deliberately and intentionally untruthful and that to support it he deliberately fabricated an instrument, to be used upon this trial and other trials involving Weston's patents. **It was a careful, premeditated, and elaborate attempt, by untruthful testimony, fortified by fabricated exhibits, to deprive Weston of his just rights in his inventions, to impose upon this Court, and to pervert the course of justice. I direct that the evidence and exhibits in this case be submitted to the District Attorney in order that he may take under consideration the question whether a prosecution should be brought against La Roche for perjury."**

The MONARCH Desk Set

is so simple in construction as to make trouble almost an impossibility. The switch is mounted in the base and is directly actuated by the hook. The arrangement of the springs is exactly the same as in the switch-hook used in Monarch wall telephones. No electrical connections are made with the stand. All connections are brought to a rubber block in the base :: :: :: ::

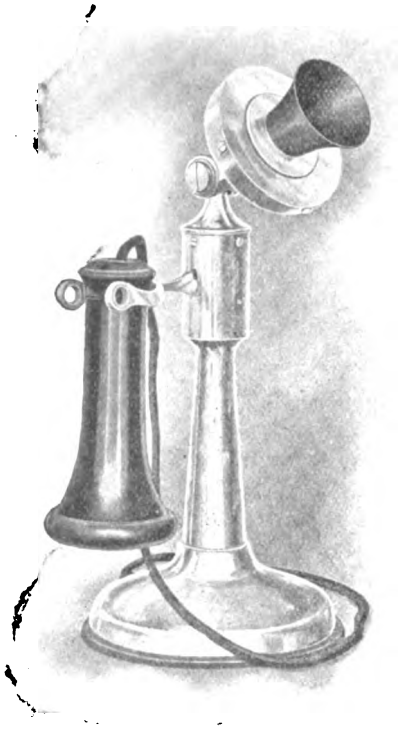
REASONS.



1. Our Company is officered and owned by Pioneers in the Telephone Business.

2. They are Operators of exchanges aggregating over 35,000 subscribers.

3. They Operate over 3,000 miles of Toll lines.

4. They are posted on the wearing qualities of the various makes of Telephones and know their weak points.

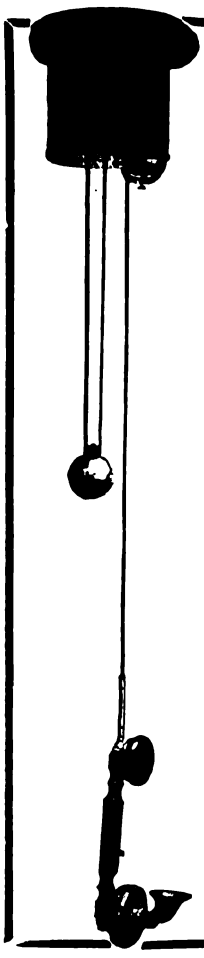
5. These weak points do not exist in "Eastern" Telephones.

6. Who can be better qualified to judge of good apparatus than Operators of the largest Independent Systems in the United States.

7. If built for their use, with the weak points eliminated, are they not good for your use.

8. Send us a Sample order for trial. Return Telephones if unsatisfactory.

Eastern Telephone Mfg. Co.
WEST CHESTER, PA.



Just What We've Been Trying to Tell You!

"Your instruments cannot be excelled. As a test, we have had a PENDENT TELEPHONE in use at the Union Pacific depot here for some time past, and it has not yet been out of order for a moment. They would simply not do without it there. It is always handy, and out of the way, and is as much superior in that respect to an ordinary desk set as the desk set is to the wall phone.
"ELLSWORTH ELEC. LIGHT & TELEPHONE CO.
"Ellsworth, Kansas."

(This was written two years ago; next week we publish another of their letters, written only last month.)

We have permanently adopted a time-tried and proven Coiled Piano Wire Cord for

The Pendent Telephone

This precludes the last possibility of trouble; but the additional cost has decided us to increase our price ***One Dollar*** on and after the first day of August.

Swedish-American Telephone Co.,
Chicago , Ills.

Gentlemen:-

In referring to your favor of the 1st., will say that it gives me much pleasure to state that the companies I represent have in the neighborhood of fifteen hundred Swedish-American telephones working , both central energy and magneto , bridging and series , desk sets of both systems . They are giving entire sarisfaction .

In addition to the satisfaction derived from the use of your equipment , our companies have always found your house willing and ready to promptly rectify any defects that have shown up in the use of so many instruments , in addition , according to us all the courtesies that any one could reasonably ask .

The telephones and treatment have been entirely satisfactory.

Yours truly
Theodore Gary

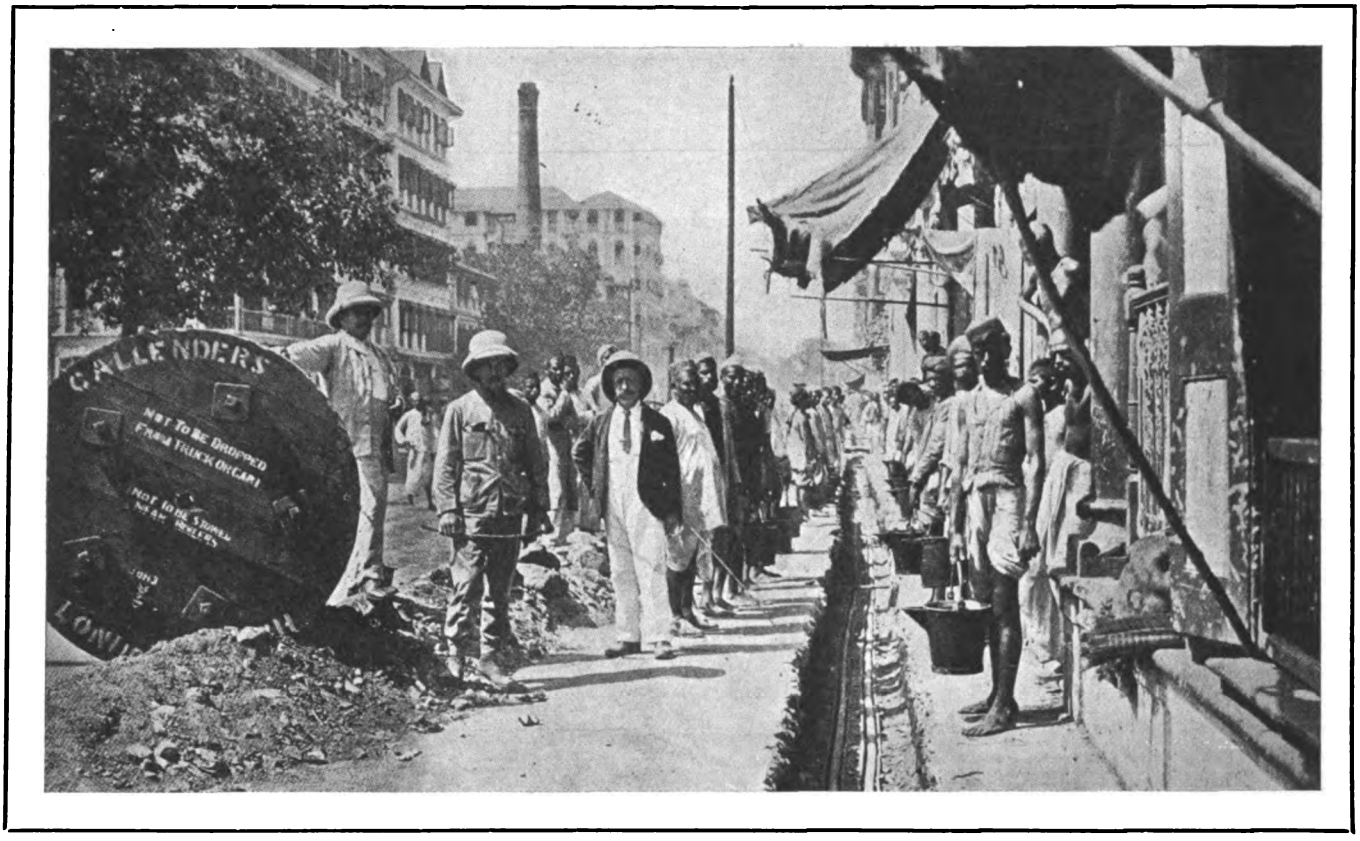
TELEPHONE CONDITIONS IN THE ORIENT

THE telephone has been used in the Orient for a number of years in a perfunctory manner, but it is only recently that its general use has been taken up in India and other Asiatic countries. It is quite probable that with the tremendous population, averaging in the neighborhood of the entire country of 400,000,000, that there is not over 15,000 to 25,000 telephones in use. In Egypt, the telephone system was erected by the Oriental Telephone Company and sublicensed to the Egyptian Government for a term of 25 years. In all, there is upwards of 3,500 miles of telephone lines, and exchanges from Alexandria, on the Mediterranean, up to Assoum, on the Nile, including the city of Cairo. In the Straight settlements the Oriental Company, which apparently has a monopoly of the telephone field in the East, has secured a franchise for 31 years from the Indian Government. In the cities of Calcutta, Bombay, Madras, Rangoon, Moulmien, Singapore and Hong Kong underground cables are to be run in accordance with an agreement made with the several governments, within the next four years. The license for operating in India proper was granted for a period of 60 years, on account of the large amount of work to be done and the tremendous outlay involved.



Laying Cable in Bombay, India.

A trouble that has confronted all propositions involving labor is the caste question. The Hindoos are divided into numerous sects, each sect of which owes allegiance to a certain god. For instance, there are Brahmins who worship Brahma, devotees of Vishnu, Parsees who worship fire, and Mohammedans. According to the ancestry of these various people so is their caste standardized, and we find that the average Indian household requires from two to twenty different servants. A man who draws water and is called *Bishti* would not dare to dig the garden for fear of losing caste. The man who operates the long swinging fans—called *punkas*—and who is termed a *punka-walla*, would not fetch the mail or cook the dinner. The lowest class are the *Majoors*, who dig the streets and are equivalent to the ordinary laborer in the United States. The wages these people receive vary from six to twenty rupees, or, in American money, from $2 to $7 a month. Low as this may seem, it compares favorably with the wages paid for coolies and other Oriental labor. Our illustration, taken in the city of Bombay, represents the laying of telephone cable through one of the main streets of the city. The peculiar construction of the ducts is worthy of notice. This method of construction is the one generally used, since the materials for the ducts can easily be made, being nothing more than troughs, and the cost of installing is consequently much lower than would be were all the materials imported.

In China, telephone exchanges have been in operation for a number of years in the cities of Canton, Hong Kong, Shanghai and Pekin. These systems employ Swedish apparatus almost exclusively, whereas in India the apparatus is German, French and English. In Japan the telephone development has been of a most rapid character. In fact, nearly all the large towns have telephone systems. At present, English apparatus is used exclusively, but it will soon be replaced by the American type of instruments. The Japanese are particularly adapted to the rapid assimilation of American ideas, and their telephone systems would compare favorably with many of the smaller ones in the United States.

The construction of the aerial lines in Oriental countries necessitates the use of precautions which are not met with in European or American construction. For instance, long stretches of lines run through country districts and dense forests, where the trees and shrubs grow so rapidly and are so dense as to necessitate a constant vigil to protect the line from being short-circuited or grounded by the trailing creepers. Again, wild animals do their share of destruction, and it has been found necessary to use iron poles in many instances. A recent shipment by an American firm was made of 40,000 composite poles with iron bases and wooden tops. The reason for this composite construction being that the tigers and other wild animals would try to sharpen their claws upon the smooth wooden poles, consequently they would soon be worn away, whereas with the iron base and the wooden top the required protection was secured and, at the same time, the cost was considerably reduced.

NEW YORK INDEPENDENTS HOLD CONVENTION

(Reported by our Special Representative.)

BUFFALO was the scene of the Third Annual Convention of the New York State Independent Telephone Association on June 23d and 24th. When President George R. Fuller, of Rochester, called the meeting to order at 2.30 P. M. the first day, there were between two hundred and two hundred and fifty delegates present from all parts of the State, representing nearly four hundred prosperous Independent exchanges and toll line companies.

A radical departure was made by the Association in amending its constitution to provide that the membership will be composed of individuals instead of companies. The membership fee was also reduced from $5.00 to $1.00.

Special arrangements have been made with THE AMERICAN TELEPHONE JOURNAL, by which each new member of the Association on the payment of the membership fee of $1.00 will be entitled to a year's subscription to THE AMERICAN TELEPHONE JOURNAL.

This action was taken in order to increase the membership and usefulness of the Association. Secretary Lane, in explaining the action of the Association, said:

"Heretofore, with the annual dues of $5.00 a year, it has been very difficult to induce the companies to join the Association. By reducing the fee to $1.00, including a year's subscription to THE AMERICAN TELEPHONE JOURNAL, and opening the Association to individuals, we expect to have a very large membership of stockholders and official employees of Independent telephone companies. By the time we meet again, which will probably be next June at Albany, I confidently expect to have a membership of five hundred representative New York State operators. This will give us the strongest State organization of Independents in the country. With such a powerful association, we will be in a position to help each other in our mutual fight to give the people of New York State unequalled telephone facilities in a way never done before. We want every Independent telephone operator in the State to join our Association." (See coupon in the advertising pages of this issue.)

T. S. Lane, Sec'y N. Y. Ind. Tel. Assn.

The session was called to order by President George R. Fuller, who introduced Councilman Stoddart, who made the address of welcome on behalf of the Mayor, who was absent from the city.

Many delegates told of their experiences in various sections, organizing and installing Independent telephones. Among those who spoke were B. G. Hubbell, of Buffalo; J. S. Brailey, Jr., of Toledo, O.; F. M. Potter, of Syracuse; T. Harvey Ferris, of Utica; H. W. Blake, of Naples; E. B. Fisher, of Grand Rapids, Mich.; and A. M. Taylor, of Penn Yan.

Charles B. Hill, of the Frontier Telephone Company of Buffalo, extended an invitation to all the delegates present and their friends to visit the Frontier plant. At 4.30 o'clock the meeting adjourned so that the delegates could inspect the Frontier plant. They were taken all through the place from basement to roof.

A banquet was held at the Ellicott Club by the Frontier Telephone Company and the Inter-Ocean Telephone & Telegraph Co., the Buffalo long-distance company, which practically covers the State. It was without doubt the swellest function ever given by Independent telephone men. On every table was an Independent desk set, the wires festooned from the ceiling.

The speakers of the evening sat on a raised platform at the head of the table. The toastmaster was B. G. Hubbell, of Buffalo. On his left was H. D. Critchfield, of Ohio. On his right was Geo. R. Fuller, of Buffalo. The others at the speakers' table were: E. C. Lufkin and Charles B. Hill, of Buffalo; E. B. Fisher, of Grand Rapids, Mich.; J. G. Splane, Pittsburg, Pa.; W. D. Barnard, Philadelphia, Pa.; J. S. Brailey, Jr., Toledo, Ohio; Frank H. Mott, Jamestown, N. Y.; A. L. Têtû, Louisville, Ky.; and W. L. Cary, Cleveland, Ohio.

A good part of the next morning was spent in examining the manufacturers' exhibits in the parlors of the Genesee Hotel.

The election of officers for the ensuing year resulted as follows:

President, H. H. Persons, vice-president and general manager Frontier Telephone Company, Buffalo; First Vice-President, Howard Hendrickson, president Albany Home Telephone Company, Albany; Second Vice-President, Boyd McDowell, York State Telephone Company, Elmira; Treasurer, T. Harvey Ferris, Utica Home Telephone Company, Utica; Secretary, T. S. Lane, general manager Inter-Ocean Telephone & Telegraph Company, Buffalo. Executive Committee: Geo. R. Fuller, Rochester; H. H. Persons, Buffalo; B. G. Hubbell, Buffalo; Edward Davis, Binghamton; C. H. Poole, Utica; S. B. Rawson, Albany; J. S. Brailey, Jr., Utica; T. B. Basselin, Croghan; F. M. Potter, Jr., Syracuse; J. F. Stockwell, Oswego.

Papers were then read by W. H. Johnson, assistant general manager Frontier Telephone Company, Buffalo; F. M. Potter, Jr., general manager Syracuse Telephone Company; T. S. Lane, general manager Inter-Ocean Telephone & Telegraph Company, Buffalo; Geo. R. Fuller, secretary and manager Rochester Telephone Company; and M. S. Conner, chief engineer Stromberg-Carlson Telephone Mfg. Co., Rochester and Chicago. These papers were all most interesting.

Mr. Scowden, of Frewsburg, introduced the following resolution, which was seconded by Mr. I. H. Griswold, of Albany:

Digitized by Google

Be it Resolved, That it is the sense of the New York State Independent Telephone Association that the territorial rights of any and all accredited Independent telephone companies, toll lines or exchanges shall be scrupulously respected, and that no Independent telephone company shall encroach upon the territorial rights of any Independent telephone company operating an efficient and comprehensive telephone service.

This resolution was unanimously adopted by the Association and is of special significance, not only to the toll line companies, but to the local exchanges operating in the State of New York. The principle outlined represents the foundation of the entire Independent telephone movement, tending as it does to safeguard the investor and guaranteeing him territorial protection. In other words, it clearly defines the policy of the Independents, which is to carefully refrain from competing with each other. Any attempt on the part of one Independent telephone company to build competing exchanges and toll lines in competition with other Independent telephone companies, thereby depriving them of a portion of their revenue, should be discouraged throughout the entire Independent field, and any company doing this directly or indirectly should be subject to the criticism of Independent telephone interests generally.

The special traffic committee, consisting of S. B. Rawson, T. S. Lane, and Edward Davis, submitted to the executive committee a careful report near the end of the session. It is of such interest that it will be printed in full in an early issue of THE AMERICAN TELEPHONE JOURNAL. The report was considered by the executive committee and adopted by the Association.

EXHIBITS OF THE MANUFACTURERS

ON entering the corridors and parlors of the Genesee Hotel, delegates to the Convention found not cannon, but telephone apparatus to the front of them, telephone apparatus to the right of them, telephone apparatus to the left of them, and to make it more impressive, the genial representatives of the manufacturers were behind them, if they attempted to steal away without a good look. Probably no Independent Convention outside of the Interstate or National has had such a representative collection of manufacturers' exhibits as was to be found at Buffalo.

We will endeavor to give the reader a slight conception of the "dangers" of the delegates, first commencing with

THE CENTURY TELEPHONE CONSTRUCTION COMPANY,

of Buffalo, N. Y., which occupied parlors 116 and 118. The company was ably represented by B. L. Moore, general manager, Gustav F. C. Bauer, sales and advertising manager, and Will W. Kidney, engineer. The parlors were beautifully decorated with palms and cut flowers, the red peonies especially forming a splendid setting for the exhibit. A complete switchboard and powerboard, just turned out of the Century factory for the Newark, N. Y., Telephone Company, formed the principal exhibit. The powerboard is so arranged and the line signals so wound, that a complete test can be made for locating grounds on either side of the line in a minute. The switchboard is a two-position, common-battery, transfer-type, equipped for 320 lines. The powerboard is exceptionally attractive, being equipped with Crouse-Hinds tubular arm switch and Weston voltmeters and ammeters.

The Century Company showed a full line of magneto and common battery telephones; its platinum electrode transmitters, new line signals for either magneto or common battery boards, new jacks, lamp jacks for lamp signal boards, protected opals for supervisory lamps, small type wall bell-signal switchboard for rural lines, and a 100-line magneto board with 50 drops equipped. A new composite device for building up toll lines for use in telegraph work attracted much attention. It is so arranged that a complete test of toll lines can be made both in and out for opens, shunts, grounds, etc. The telephones exhibited were all mounted on two antique racks made on the mission style. The company's new desk set in which the hook can be inspected without taking the receiver off the hook and its binding posts made for regular cord tips also formed an interesting part of the exhibit.

On the next floor of the hotel, occupying two large rooms was

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY,

of Rochester and Chicago, which had an exhibit of some of its telephones and switchboard apparatus. Samples of underground and switchboard cable and cords were also shown. Great interest was evidenced in the line of new relays for central energy switchboards, which were here shown to the public for the first time. The new generators that the company has just put on the market were the subject of much comment by those who are interested in general call systems and toll line work. M. S. Connor, chief engineer, and James S. Gibson, who represented the company, had several fine photographs of exchange installations. Not the least interesting part of the exhibit was a line of rough brass castings for generators, desk stands, transmitters, and switchboard parts. These were shown just as they came from the sand moulds in the unfinished state, and illustrated well the manner in which the Stromberg-Carlson Company produced apparatus from the raw material.

The magnificent mahogany cabinet lamp signal, full central energy switchboard and telephones, forming the private branch exchange system of the Genesee Hotel, which is connected with the Frontier Telephone Company's exchange, and which was greatly appreciated by the convention delegates, was manufactured by the Stromberg-Carlson Company.

In parlors 104 and 108, F. F. Sapp, sales manager, George B. Pratt, Ohio State representative, and Raymond Hendrickson, Eastern representative, had a beautiful exhibit of apparatus made by the

NORTH ELECTRIC COMPANY,

of Cleveland, Ohio. The company had a section of switchboard equipped with indicating four-party lines, selective ringing keys with telephones connected in order to demonstrate how the system worked. A new type of breastplate transmitter, which the company has just put on the market, the object of which is to bring the transmitter within easy speaking distance of the operator, and at the same time to have it in as nearly a horizontal position as possible, was the subject of much favorable comment. The company also had a central energy lamp signal board and a magneto board connected with various types of telephones mounted on racks. An electrician from the Cleveland factory explained the working of the various boards to the delegates. A new desk set and the company's new type of non-adjustable receiver were also exhibited. An interesting part of the exhibit which also formed a suitable background for the exhibit, were 40 enlarged platinum photographs of installations by the North Electric Company, the originals of which were taken by Mr. Sapp.

THE F. BISSELL COMPANY,

represented by E. B. Terry, had a good display of construction tools, among which might be mentioned: cable trolley cars, pole top terminals, pole seats, marlin cable hangers, samples of its bullfrog brand wire, and a new type of conduit rod. It also exhibited samples of its "Security" potheads and cable sleeves. These were formerly known as Novelty potheads and sleeves, but have just been purchased from the New Haven Novelty Machine Company and will now be manufactured exclusively by the F. Bissell Company.

THE STERLING ELECTRIC COMPANY,

of Lafayette, Ind., was represented by S. C. Platt, New York representative, in Room 502. Mr. Platt exhibited a full line of

Digitized by Google

telephones and switchboard parts, all standard products of the Sterling factory.

THE MILLER ANCHOR COMPANY,

of Norwalk, Ohio, had an exhibit in Room 120, in charge of G. H. Miller, the president of the company. A neat souvenir was distributed, being a small reproduction of the company's guy anchor.

THE MCINTOSH HARDWARE CORPORATION,

of Cleveland, Ohio, manufacturers of telephone supplies, was represented by E. J. Newton.

THE AMERICAN STEEL & WIRE COMPANY

did not have an exhibit, but distributed information regarding telephone wire.

METHODS OF HANDLING TOLL BUSINESS*

BY T. S. LANE.

ANY system for handling tolls must take into consideration compensation of station originating business, the establishment of uniform rates, routings, division of mileage among different companies, method of settlement and a multitude of minor details. Such a system must possess three qualifications: it must be elastic, simple and equitable. Elasticity means the ability of the system to adapt itself to any territory, any combination of toll lines and exchanges, one which will not be interfered with by special routings or by other conditions peculiar to some particular locality, in other words, the method must be sufficiently flexible to provide means to properly account for and handle a toll message from any point in New York State to any other point in New York State, and by the same means, must take care of business between points in New York State and points in other States, and this must be accomplished without departing from the general policy adopted.

As to the second qualification, a system to be simple must be one which can be easily understood by the manager of any exchange or any toll line company whose business is settled in accordance with its provisions, and must be free from unnecessary detail. The charges and credits for each company must be easily understood and so made that each company receiving a statement may readily check the statement, the mileage division must be so plain that any one with a standard map can be assured of the accuracy of the statement rendered, or can detect errors if such exist. A simple system is one which accomplishes a maximum of results with a minimum of labor.

Any successful system covering division of toll revenue must provide for a fair and equitable distribution of receipts, not only between connecting toll line companies, but between the toll line company and exchanges with which it connects. A system designed for the particular benefit of the toll line companies has a tendency to reduce interest in the development in this important branch of the business by the exchange, and leaves small inducement for the local companies to provide prompt and efficient toll line service. A division of revenue which is unprofitable for the toll line company gives no incentive to the toll line company to extend and perfect its system. Local exchange companies and toll line companies are mutually dependable, each upon the other. The exchange must have the toll line business to meet the demands of its patrons. The toll line company must have the local exchange to produce the business which it handles, all of which demonstrates the necessity for an equitable plan of revenue division.

Following the general qualifications are a number of specific problems which must be considered and definitely decided, such as rates, mileage, time limit of messages, night rates, method of dividing revenue between connecting toll line companies, method of dividing toll revenue between exchanges and toll line companies, method of tariff division betwen groups of companies, method of reporting toll business, method of transmitting toll messages, franked business, accounting, forms to be used, etc.

To arrive at a uniform and equitable schedule of tariff rates, many toll line companies have found the so-called "block system" of great assistance. The application of the block system is as follows:

A map of the territory to be covered is sub-divided into squares of five or ten miles and each square numbered. This gives every station and exchange in the entire territory a block number whether station is connected or not. As the mileage between any two given points must determine the toll rate between said points, an easy way of arriving at the mileage is to consider the air-line mileage between any two given stations as being the distance represented by the air-line mileage between the centers of the respective blocks in which said stations are located. In this way the air-line mileage between the center of each block to the center of all other blocks is ascertained at the start, and, having determined upon the rate per air-line mile, which is to govern the tariff, the rate between any station and all other points covered by the block system is immediately ascertained by referring to the rate governing the block in which the station is located. As soon as a new station is connected, it is only necessary to notify all other stations of the connection, together with the number of the block, and all stations by this means are informed as to the rate to the new connection.

The advisability of determining rates by the old method formerly used by the Bell Company, based on pole line mileage, is so obsolete as to call for no discussion as to its applicability to a general system of handling toll business. Without competition, the plan of basing rates on pole line mileage is doubtless practicable, but with two competing interests in any field, an attempt to meet competition and base rates on pole line mileage would result in a schedule of rates which would be unsatisfactory to the public and which would not represent intelligent competition. Between two points, one company might have a pole line mileage of 200 miles, and a competing company a pole line of only 100 miles. The company basing its rates on the air-line distance would be more liable to be right from a competitive point of view than would the company adopting pole line mileage. On extremely long hauls between large centers, for instance, between Buffalo and Philadelphia, it might be advisable to modify the air-line mileage basis on account of extraordinary pole line mileage as compared with the air-line mileage, and in fact any rates based on the above mentioned plan can be easily regulated by issuing special rates to meet extraordinary conditions.

As to the amount of tariff to be charged per air-line mile, there is a wide difference of opinion. Some operating companies claim that a revenue of one-half cent per mile leaves a margin of profit. Others advocate a minimum charge of six-tenths cent per mile. A schedule of tariff rates, based on air-line mileage, should conform as far as possible to a charge of two-thirds cents per air-line mileage with a minimum of six-tenths of a cent per mile, and no rate should be made of less than 10 cents between any two toll points.

The question of time limit for toll messages is one which merits careful consideration. The Bell Companies long ago discarded the five minute rate, and many of them are to-day making a low rate for a one minute service. The making of five minute rates by the model plants, from an engineering point of view, with the very the start, the theory being that the Independent companies in offering a five minute rate at the price their competitors were charging for three minute service would be a great argument in favor of Independent toll line service as

* Abstract of paper read before N. Y. State Ind. Tel. Assn. at Buffalo, June 24, 1904.

Digitized by Google

against other toll line service. This theory is wrong, for the following reasons:

The great majority of toll users are business men, who regard promptness as an essential feature of good toll service, and especially valuable. In the majority of cases the business man can complete his conversation in three minutes if he knows that three minutes is the limit, and he would rather reach his party quickly on a three minute basis than to have the privilege of talking five minutes and experience long delays.

In meeting competition, toll line service is considered chiefly from two points of view, promptness, and clear transmission, and of the two, prompt service counts for more, if anything, than the other, although both are essential. In the keen competition now under way between the two opposing telephone interests, the toll line company which handles calls without delay will have all of the business that it can handle. In brief, the toll user prefers a three minute service which he gets to a five minute service for which he waits. It has been argued that "the five minute time limit is good advertising for the Independent company, and that the toll user does not consume any more time than if limited to three minutes." This is false reasoning. If the advertisement does not make a sufficient impression on the toll user to cause him to make use of his full time limit, it has no value from an advertising point of view, and on the other hand, toll users time their conversations and make use of the extra two minutes simply because it cost nothing, thereby unnecessarily blocking the service.

The toll situation of the Independent companies to-day is as follows:

The toll lines of every Independent company are crowded to their utmost capacity, and so rapid is the increase of business that although hundreds of workmen are employed in installing additional toll circuits in all parts of New York State, the increase in business is constantly ahead of the capacity, and it is only by carefully watching operating conditions and keeping down the limit on messages that toll line companies can hope to take care of the volume of business which is being given to them. Under present operating conditions, a line between two stations working on a three minute schedule should be able to handle not less than sixty messages daily. In localities where the five minute rate is in force then the number of messages handled daily when the lines are worked to their utmost capacity is scarcely more than half of this number. In many exchanges in western New York the original limit on toll messages was five minutes, and although the change was made to three minutes with considerable doubt as to the result, the complaints against this change have been so few as to scarcely warrant attention, and no company which has adopted the three minute schedule will advocate a return to the five minute schedule.

Experience has demonstrated that less than 25 per cent. of the calls made under the three minute limit plan use over-time. For instance, during the month of April one exchange originated 3,663 messages and received 4,488, a total of 8,151 messages, and out of these calls only 306 messages were over-time messages. The Union Telephone & Telegraph Company, of Western Pennsylvania, and the United States Telephone Company, of Ohio, have successfully used the three minute schedule for some years, and express themselves as satisfied with the results.

A uniform scale of reduced night rates is desirable to apply between the hours of 6 P. M. and 6 A. M., when toll lines are comparatively idle unless an inducement is made for this period. A reduction in rates exceeding 25 cents can be made to profitable advantage, the minimum reduction being 50 per cent. No night rate on messages exceeding 25 cents to be less than 25 cents.

A simple and easily understood method of dividing revenue between connecting toll line companies is as follows:

Deduct from the total revenue represented by interchanged business the originating commissions due each company, the remainder of the toll tariff to be divided between the connecting companies in proportion to the ratio existing between the air-line distance from point of origin to point of transfer and the air-line distance from point of transfer to the point of destination. For example, let "A" represent a toll station on one company's lines, "C" a toll station on another company's lines, and "B" the meeting point of the lines of the two companies. Suppose that the air-line distance from "A" to "B" is 20 miles and the air-line distance from "B" to "C" is 10 miles, and the number of messages during one month between "A" and "C" one hundred. The total mileage represented by the line from "A" to "B" will then be one hundred times 20 miles or 2,000 miles. The total mileage represented between "B" and "C" will be one hundred times 10 miles or 1,000 miles. The total mileage of the two companies for business between "A" and "C" will be 3,000 miles. If the rate between "A" and "C" is 30 cents, the toll revenue represented will be one hundred times 30 cents or $30.00. If each company deducts 25 per cent. for originating the business, there will remain $22.50 toll tariff subject to mileage division, and of this two-thirds should go to the credit of the company owning the line from "A" to "B," and one-third to the company owning the line from "B" to "C." Following out this plan of mileage calculation, the credit for each company on a month's business between all stations on one company's lines and all stations on the other company's lines can be included in one general settlement and the exact amount due each company on mileage easily ascertained. In arriving at mileage settlements between connecting toll line companies, each company should assume the mileage of its subsidiary connections and should make a division of its share of the new revenue with such connections.

In reference to the division of tariff between toll line companies and exchanges having no toll line mileage, it must be borne in mind that the toll line companies have their entire investment tied up in a system from which their sole revenue is toll business, and although exchanges at the termini of the toll line may represent a much larger investment than is represented by the toll line, the investment in the exchange depends only in a small measure on the toll line business which is handled by the exchange, with very little additional investment. For instance, a toll message transmitted between two exchanges of 1,000 subscribers each, over a toll line having two circuits, involves the actual use for the time being of only one-thousandth part of the investment in the exchange, but at the same time, ties up one-half of the entire toll line system.

There can be no dispute as to the fairness of basing commissions paid to exchanges entirely on originating business for the reason that a large part of the expense incurred by the exchange in handling toll business arises from the necessity of making collections, and it seems reasonable that the exchange, which assumes this part of the transaction, should be entitled to a greater compensation than the exchange which merely delivers the message.

METHOD OF MAKING CHARGES AND GIVING CREDITS.

In making charges against and giving credit to various companies dividing toll revenue, the following method is used:

Charge each company with "tolls sent paid," "tolls received collect," and "messenger fees collected." Give each company credit for "messenger fees paid," "commission on originating business" and "mileage" (as shown by mileage statement). To get this information it is, of course, necessary for each company originating business to make a careful record of the business transacted with each station as follows:

"Number of messages sent," "number of messages received," "over-time," "amount of tolls sent paid," "amount of tolls sent collect," "messenger fees collected," "tolls received paid," "tolls received collect," "messenger fees paid." So-called "deadhead messages" should be entirely eliminated and operators required to make a charge ticket for all messages, no matter by whom sent or for what purpose. A record can be made of company business subject to frank, and an adjustment of same made between companies interchanging business. Some contracts between large toll line companies specifically set forth that neither company shall carry free business for the other.

TRAFFIC ASSOCIATIONS.

In many localities, a limited territory is covered by a series of short connecting toll lines, each line owned separately and under separate management, and the division of joint revenue between such lines presents a problem more complicated than the division

Digitized by Google

between large toll systems. In some instances, this problem has been solved by local joint traffic associations. The membership of the association is composed of representatives of each of the connecting companies, the plan of revenue division being similar to that outlined in the present discussion. The formation of local associations should receive careful consideration and should be encouraged.

In Chautauqua County are nine short toll lines, extending from Jamestown via Sherman and Mayville to Westfield, and thence east and west from Westfield along the Lake Shore. Some time ago these companies formed a traffic association for the purpose of establishing uniform rates and adopting a system for handling the business interchanged among themselves, as well as business to points outside of their district. This association, known as the Independent Telephone Clearing Association, with its office at Sherman, receives a monthly report of the business transacted from each of the companies making up the association. The association employs a secretary, who maks a division of the revenue from the reports received, rendering each company a statement of its charges and credits. Remittances are made direct to the association secretary, who in turn makes remittances to those who have balances due them. The secretary's compensation is based on a certain amount for each message handled by him in the work of clearing the entire business, the amount being fixed at something like one-half cent per message.

The method of dividing revenue derived from business going to points on other lines outside of the association lines is as follows:

The association lines connect with the lines of the Inter-Ocean Telephone and Telegraph Company at Jamestown and with the Union Telephone and Telegraph Company at Corry, Pa. Each of these toll line companies renders a monthly statement to the association treating the entire group of lines as one toll line company. If the Association has a balance due it from toll line companies, it goes into the association fund for general distribution and is disbursed among association members according to mileage furnished by each.

The local association has a great advantage in being able to come in close contact with its members and to know thoroughly the territory which is being covered. Switching fees are entirely eliminated in our interchange of toll business throughout the State, and should be entirely done away with, as their general adoption acts as a great handicap to the successful conduct of the toll business and gives competing interests a great advantage over the Independent toll line systems. There has been some discussion relative to the formation of a State traffic association for the purpose of clearing interchanged business between the larger toll line companies. This class of business represents, at the present time, a comparatively small amount, and we are not ready for an association of this kind for the reason that the revenue represented is not sufficient to warrant the expense necessary to maintain and conduct such an association.

So far as Western New York is concerned, the toll line companies are having no difficulty in arriving at a division of revenue at a very small expense; in fact, at a cost of less than two per cent. of the gross business cleared. The real need is for a method of making a fair division in localities covered by short lines interchanging a large volume of business. If these different localities can be formed into associations, organized on similar plans and using similar methods, the results will be satisfactory throughout the State, and from these smaller associations we will gradually work into one joint traffic association in which the missionary work will have been accomplished. No manager of a State traffic association could at the present time be familiar with the conditions in all localities covered by short connecting lines, and the serious complications which arise in establishing rates, regulation and routings come from just such localities.

A still better plan for bringing about a uniform toll service would be a concentration of short lines under one management, for instance, in certain counties in which a dozen or more separately controlled lines are interchanging business, an association or even a corporation could be formed from among the various connecting companies, which could lease all the connecting lines and operate them as one line, allotting to each company a division of the net revenue in proportion to the pole line mileage furnished.

"Unity of control" is a phrase which may not appeal particularly to a gathering of independent association men, but at the same time the more we can intelligently concentrate "control of operation" of our toll lines, the nearer we come to perfection in uniform and efficient toll service.

ARE PRESENT BUSINESS METHODS SATISFACTORY?*

By F. M. Potter.

An overwhelming demand by the people and the refusal to grant lower rates by the Bell Company at a period when its monopoly was undermined by patent expiration, gave birth to the opposition telephone movement.

The general type of telephone and the general business plan inaugurated by the Bell Company have been universally followed to this day. It may be that a movement having its birth but a decade ago can be excused for not putting into existence at once a series of methods far different from those of a successful pioneer corporation. But defects in these methods have been made apparent, and it is evident that the future telephone business of any community is to be done by that company which will most satisfactorily cater to the wants of its patrons, and which will take the public into its confidence, and prove that its fundamental business object is to grant to its customers every possible advantage regarding quick service, courteous fair treatment, and manifest a generous desire to incorporate into its growing business every available benefit of improved apparatus and improved practice.

The Independent telephone interest to-day is a giant, with a giant's strength, but there still lies within a far greater and more powerful latent force in its army of active interested citizens that is shown by its remarkable growth.

The American Bell Company, establishing a business practice based upon its strong, arrogant and fortified position, assumed to bind the unfortunate who by need was compelled to pay its exorbitant rate to a long term contract. The early business policy of this company, embittering every section alike had the effect of bringing down a general desire for retaliation from its users. The proof of its error is vividly before all. In its legal and commercial tactics and in patent litigation it has met continuous defeat, leaving the Independents to-day a factor in the great commercial future of the United States.

The more prominent weaknesses of the early system have been met, and many of its imperfect features improved upon and perfected. But during the struggle the telephone conditions have altered. From a luxury enjoyed by the wealthy the telephone assumes such a position to-day that no one will deny that for both business and social advantage to all classes it is a substantial and positive necessity.

In recent articles appearing in the telephone journals the abuses of the unlimited service have been pointed out, with illustrations and comparisons drawn from the methods of railway,

* Abstract of paper read before N. Y. State Ind. Tel. Assn. at Buffalo, June 24, 1904.

Digitized by Google

steamship, express, gas and electric lighting companies, and other public service corporations. To what ebb would the securities of these corporations fall were they to put into effect the present telephone business system? We may not deny the abuse—the Bell company has perceived it for years. That company attacks the fault with a measured limited service. Some of us are attempting to profit by their endeavor to extract themselves from their own snare. The attempt is wrong; it will bring many benefits, but nevertheless it is from a business standpoint radically wrong.

The cost, the annoyances and the slackened service due to an attempt to make the operators manual recorders, have brought toll-collecting devices into extended service, especially in the larger cities; this method, eliminating the greater faults, has proven in may respects quite satisfactory. The general commercial business practice of charging the user for the amount of service consumed seems to be right, being as it is satisfactory, just and equitable to both subscriber and company alike.

To secure the greatest amount of money from a given community for a given commodity at a low cost seems to be the ideal business design. The telephone companies have just this chance. Why may it not be practicable to establish a toll-service system, and place telephones in for any one who is sufficiently able to pay a small guarantee or who is able to secure a guarantor, as demanded by the light and gas companies for meter installation? Let the guarantee be a minimum, as low as practicable; let your service be extensive; make your income a direct product of the service given. Your income will grow with the demand.

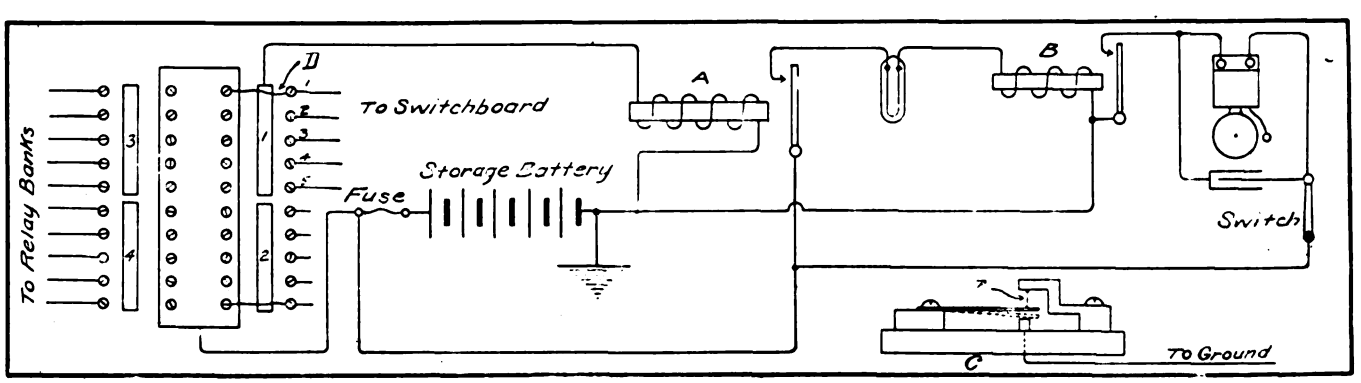
Every connection made through your switchboard means a drop into your financial coffers. You believe the practice will call for a deliberate subsiding of your exchange activity. It will, indeed, and you will find immediate relief of operators working under high pressure service. You have eliminated the non-paying element, legitimate service is substituted, and as the cost of operators, exchange operation, depreciation of apparatus, wear and tear upon cords, jacks, etc., is directly proportional to the service, your business therefore secures at once large immediate benefits. With a minimum charge the company is guaranteed its fixed charges; with its lower rates it has guaranteed to it a broadened and more extensive telephone plan than is now in existence. It may be expected to broaden the scope and value of the telephone and stimulate its use to such an extent that the revenue derived from a measured service call will far surpass any income secured through the contract system. If it be objected that toll-collecting apparatus and service measuring devices for the subscriber or for the exchange have not reached the highest stage of perfection, this is no objection to the system itself. The system once conceded to be correct, there is little doubt but that inventive genius will produce the requisite mechanism. Should the plans thus outlined be developed to a complete practical system, we might well hope to see installed throughout the land a telephone system satisfactory, stable and vast in comparison with that in existence to-day.

With such a system a telephone corporation is in a position where its securities would not be sold on the basis of the number of contracts it has been able to bind its citizens to and the term period for which these contracts have been taken, but these securities would be sold upon the basis of the population and the character of the community. The investor would know that if the property is properly built and operated under good management he would receive remunerative returns. He would gauge the telephone business as he does that of the gas, the electric light, or the trolley. Telephone bonds and stocks would have a just valuation placed upon them; and thus under more stable conditions and consequent stimulated investment, future telephone business and securities would leap by stride and bound to a position second in standing to none in the commercial world.

AN INDICATING FUSE ALARM

By C. S. Bunderman.

ONE of the latest inventions, and probably one of the most valuable as a time saver in clearing trouble, is the automatic indicating fuse alarm. The value of this adjunct to the fuse panel is the fact of its reliability and also its aid in reducng that bugbear of the traffic manager, the "written complaint." The initial cost is higher than the ordinary fuse, but this additional expense is repaid in the advantages it affords for the rapid location and clearing of trouble.



Circuit of Indicating Fuse Alarm.

The method of application to the circuit is shown in the figure, and *C* is a diagrammatic view of the fuse itself. It will be noticed that this fuse is of a peculiar construction, and consists of a spring which is held from a ground contact by means of a short piece of fuse wire. Now when for any reason this fuse blows, the spring makes contact with the ground and closes a circuit through a relay which lights a lamp and also closes a second relay that causes a signal bell to ring. The relays bell and lamp should be placed as near as possible to the fuse panel. It will be noticed that the fuse panel is divided off into sections, each section having a separate ground conductor connected in series with a relay, thus when any fuse for a section is opened the relay of that particular section is closed, and the lamp is lighted and stays lighted till the fuse is replaced. A single point switch is provided to open the bell circuit to prevent the noise which might be objectionable till the defective fuse has been located and replaced.

The number of circuits to each ground is dependent entirely upon circumstances, but it is preferable not to have too many or else the value of the fuse as a time-saving device is eliminated.

INDEPENDENT SITUATION IN MAINE.

THE great development in Independent telephony has been in the Middle West. There occurred the first revolt from the tyranny of the Bell monopoly, when the expiration of Bell patents made revolt possible. As when a pebble, tossed into a pond, causes a disturbance which reaches out in ever-widening circles until they encompass the whole surface of the water, so from this initial revolt the movement has spread to the North, to the Pacific Ocean, to the great Southern States, and East to the very heart and center of the Bell stronghold. The Middle West is still the hotbed of Independent telephony; the East is still the great stronghold of the Bell monopoly. This is particularly true of New England, which may be called the fountain head of the Bell monopoly and the source of Bell inspiration.

This being the case, the people of the country, who always believe in fair play and a healthful competition, can look on complacently at the great stir which is being made in the State of Maine at the present time in favor of Independent telephony. That the question of telephone franchises and telephone competition, of broken pledges on the part of the Bell officials, and defeated hopes on the part of citizens, struggling in the grasp of a monopoly, should be made an issue of a gubernatorial campaign, and should stir up the people from one end of the State to the other, augurs well for the future of Independent telephony. The people will eventually come into their rights.

Maine is on the eve of a great battle for the Republican nomination for governor of the State. The most sensational element in the controversy is the issue between Lewis A. Goudy, president of the Northeastern Telephone Company, and Hon. William T. Cobb, a candidate for the nomination. Mr. Goudy has charged that Mr. Cobb was influential in obtaining a telephone charter from the Maine Legislature, on the plea that it was to be a competitor of the New England Telephone Company, and to be conducted in the interest of the people as against the Bell monopoly, of which the Bell company is an important branch. Mr. Goudy further alleges that this was the basis on which the charter was granted, and that having obtained it, Mr. Cobb was one of the party that sold this franchise to the New England company, and thereby broke the promises made to the people.

Mr. Cobb has replied to this letter, tacitly acknowledging the sale, but denying that any promises had been made. In an open letter, spread broadcast over the State, Mr. Goudy substantiates his charges and places the candidate for governor in a very bad light before the people. The Republican press has taken hold of the matter and is discussing the situation in vigorous terms, and the people seem very much aroused everywhere. It seems reasonable to infer that this alleged act of perfidy on the part of Mr. Cobb may cost him the Republican nomination.

The Lewiston *Journal*, after reciting the facts in the controversy, says editorially:

"More than that (namely, the pledges made to the Legislature), the Lewiston-Auburn city governments gave away valuable franchises to Mr. Cobb's incorporated interests on the distinct agreement that Mr. Cobb's company was out to lift the yoke from the necks of the people. We all could seem to see ourselves emerging from the melancholy days of franchise grab into the sunrise land of the Real Thing. We know what happened. The Eastern Telephone Company sold out the people but kept themselves. The Eastern company also delivered its component parts to the monopoly which it scorned and embraced on successive days. The promises were broken, the public betrayed, the Legislature of Maine unwittingly had fooled with a beautiful and polished brass brick. The city governments of Lewiston-Auburn were played with for income promised the people, but pocketed elsewhere. . . . The Eastern company, of which Mr. Cobb was one of the directors, sold out to the New England Telephone Company at a price, including, as it is stated, $10,000 for the franchise. That franchise was the free gift of the legislature and of the city governments of Lewiston and Auburn, bestowed on pledges of competition. By that sale and by that betrayal of the people the Eastern Telephone Company forced the New England Telephone Company to assess the dear people to pay dividends on what the people gave away on the pledge that they should be blessed with lower charges."

THE RESULT OF BETRAYAL.

With the further details of this unseemly affair the public at large is not so much interested; but it is a healthful sign when the people of a State like Maine, a veritable stronghold of the Bell interests, are up in arms against a monopoly which has stifled competition and raised prices in utter disregard of the people's rights and obligations of honor. The question of whether Mr. Cobb has or has not been guilty of securing a telephone franchise by hoodwinking the people and the legislature into the belief that he would give them relief from the tyranny of Bell monopoly does not appeal to the AMERICAN TELEPHONE JOURNAL. If Mr. Goudy's charges are true, certainly this is not the first time that a legislature has been presented with a "gold brick;" it is not the first time that the people have been defrauded by false promises, and it is not the first time the Bell monopoly has been guilty of these things and worse.

The really vital point in the matter is the fact that the people are resenting such treatment. The poor, dear people, who have been walked over and trampled upon and robbed by this and other monopolies, are up in arms. The worm has turned, and has turned at such a critical time that one man's political ambition may be sacrificed in the first outburst of righteous indignation.

The incontestable fact that in the State of Maine an alleged Independent telephone company, which had been eagerly welcomed by the people as affording relief from the Bell monopoly, has sold out to the Bell people, who have at once raised telephone rates throughout the field of operation, need not surprise us. The same thing has been done many times before. It is a favorite method of stifling competition on the part of the Bell interests. THE AMERICAN TELEPHONE JOURNAL has repeatedly sounded the alarm and called public attention to these methods.

The significant part of the whole transaction is the public clamor which is awakening the echoes in the old "Pine Tree State" in favor of Independent telephony. Good will come of it. Whether Mr. Cobb is defeated or elected need not concern us. In this stronghold of Bell monopoly, causes are at work which are bound to weaken this monopoly and extend the Independent movement.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

FOREIGN CORPORATIONS IN PENNSYLVANIA.

The Farmers' Telephone Company is an organization incorporated under the laws of West Virginia. Please inform us what steps must be taken to gain authorization to do business in Pennsylvania. K. R. T.

BEFORE a foreign corporation can lawfully do business in Pennsylvania, it must file a statement in the Secretary of State's office, showing its object, place of business, and the name of an agent in Pennsylvania on whom process may be served. Kilgore v. Smith, 122 Pa. St. 48; Commonwealth v. Oil Co., 101 Pa. St. 119.

PENALTY FOR FAILURE TO DELIVER MESSAGES.

THE State of Mississippi has a statute to the effect that if any telephone company "shall receive a message or matter for transmission," and shall fail to transmit correctly and deliver it within a reasonable time, the person injured shall be entitled to recover from the company a penalty and damages. Code 1892, sec. 4326. One Sanders requested the agent of the Cumberland Telephone & Telegraph Company at Charleston, Miss., to call a person in Sumner to the telephone so that Sanders might communicate with him. He made a similar request as to two other persons. None of the requests were in writing, nor were any fees paid. None of the requests were complied with. Sanders accordingly sued the company before a justice of the peace and recovered a judgment in each case for the statutory penalty of $25, but nothing was recovered for actual damages. The case was finally appealed to the Supreme Court of the State. The court reversed the judgment for the plaintiff. It said that the section was a highly penal statute and must be strictly construed. "We are clearly of the opinion that the only messages or matter referred to in that section are written or printed messages or matter. The very language of the statute clearly shows that. The messages or matter the failure to transmit correctly and deliver which subjects the telegraph and telephone companies to the penalty therein provided, are declared to be messages addressed to a person, etc. These messages, it is said, must be transmitted correctly; that is, correctly as written. To transmit correctly and deliver the same—that is, the messages or matter so addressed—is the precise language used. * * * It is our business to construe the statute strictly as it is now framed, and under the familiar principles of construction applicable to penal statutes, we are of the opinion that what took place here is not within the purview of the statute."

Cumberland Telephone & Telegraph Co. v. Sanders, Miss., 35 S. 653.

INTERFERING SUBWAYS.

A CONTROVERSY arose between the Western Union Telegraph Co. and the Electric Light and Power Company, two underground occupants of a public street in the city of Syracuse, N. Y., each having a franchise granted by the common council. The complainant's franchise, which was earlier in date, permitted it to construct a subway or conduit under certain streets, and to place wires thereunder "necessary in the operation and conducting" of its telegraph business, plans and specifications to be approved by the commission of public works and the common council. Among the many limitations and conditions of the grant, was the provision that no "exclusive franchise to use the streets and public places of the city, or any of them, for a subway or for any other purpose" should be deemed to be conferred upon the plaintiff, and that "all rights and privileges herein not specifically given, are expressly reserved by the common council." Under this permit the plaintiff constructed a subway. Subsequently, the common council, upon similar conditions, gave the defendant a franchise for a subway, to conduct and distribute "electricity for light, heat, and power for public or private use." The defendant built its line in some of the streets already occupied by the subway of the complainant, and in some places its structure was placed above and parallel to the line of the plaintiff, and at a distance of about one or two feet therefrom. The plaintiff brought suit for an injunction to restrain the defendant from using or maintaining its subway as located in the street in the beginning, and compelled it to remove its line therefrom. The theory of the complainant was that the location of the defendant's subway interferes with access to the subway of the plaintiff for the purpose of making repairs, and that it will "necessarily cause great inconvenience and expense." The trial court did not grant an injunction, but required the defendant and the city of Syracuse, which was joined as a defendant, but did not defend, to execute a bond to indemnify the plaintiff against any loss it might sustain by reason of the location of the defendant's line.

The Supreme Court of New York held that the result of the action of the lower court was an adjudication in effect, that a resort to equity was necessary because the requirement of a bond to indemnify against damages showed that there was an actual remedy at law through the recovery of damages as compensation. The court further held that the plaintiff had no right to object because the city subsequently gave another company the right to locate its subway so close to the plaintiff's subway as to cause expense in making repairs, if such subsequent location was not an unreasonable interference with the plaintiff's right. The court was divided in its opinion, four judges agreeing to the decision as above stated, and three justices dissenting. Among the majority was Chief Justice Parker, who is talked of as the next Democratic candidate for President.

Western Union Teleg. Co. vs. Elec. Light & Power Co. (N. Y.), 70 N. E. 866.

DAMAGES FOR REFUSAL TO CONNECT.

IN the case of Haber, Blum, Block Hat Company vs. Southern Bell Telephone Company, the Supreme Court of Georgia has affirmed a judgment for the plaintiff. The court held that where a subscriber to a telephone exchange at one place desired to communicate with his regular counsel in another place, was refused the long distance connection, contrary to an alleged contract, and avers that in consequence of such refusal he (the said subscriber) paid unnecessarily and unjustly a delinquent employee $175 to get rid of him and to recover from him certain property intrusted to him, and to avoid a threatened law-suit, it not appearing that such absent counsel could have controlled such delinquent employee, such payment cannot be recovered as actual or special damages. This view is re-enforced, if it needs re-enforcement, by the averment that this sum was unnecessarily paid. The court refused to allow exemplary and punitive damages in the absence of aggravating circumstances. It further held that while the breach of contract would entitle the party injured to a nominal damage at least, this principle of law does not apply in a case in which only actual and punitive damages are sued for, the pleadings being most strongly construed against the pleader.

Haber, Blum, Block Hat Co. vs. Southern Bell Teleph. & Teleg. Co. (Ga.), 45 S. E. 696.

IN THE OPERATING FIELD.

INDIANA CONVENTION AT LAFAYETTE.

(Telegraphed by Special Representative.)

AT the Convention of the Indiana Independent Mutual Telephone Association, held at Lafayette, Ind., on Tuesday and Wednesday of this week, the following officers were elected: Theodore Thorwald, of South Bend, president; C. A. Reeves, of Plymouth, vice-president; J. W. Johnson, of Elkhart, secretary.

The nominating committee was composed of J. G. S. Vandersen, of Michigan City; D. E. Miller, of Flora; Elmer Sweitzer, of Crawfordsville. The president, vice-president and secretary were appointed a legislative committee. C. S. Norton, Indianapolis; H. A. Barnhart, Rochester, and John Bell, of Salem, were appointed a committee to effect a standardization of toll line apparatus. Mr. Thorwald, in his speech, urged a closer cooperation in toll business. At his suggestion the Association empowered the president to appoint a committee of four, beside himself, to arbitrate toll matters.

Many interesting papers were read at the convention, the speakers being Professor J. C. Kelsey, Purdue University, Lafayette, Ind.; Henry A. Barnhart, Rochester, Ind.; S. B. Fowler, Lafayette, Ind.; Hon. John F. McHugh, Lafayette, and others.

To say that the convention was a great success is putting it mildly. The entertainment provided by the Sterling Electric Company and the Chicago Telephone Supply Company as hosts, was among the most elaborate ever accorded an Independent telephone convention. Manufacturers were there in force and the exhibits fairly overflowed the Hotel Lahr.

Among the exhibitors were:

Sterling Electric Co., Lafayette, Ind.
Century Telephone Construction Co., Buffalo, N. Y.
Stromberg-Carlson Tel. Mfg. Co., Rochester, N. Y., and Chicago, Ill.
North Electric Co., Cleveland, Ohio.
International Telephone Mfg. Co., Chicago, Ill.
Chicago Writing Machine Co., Chicago, Ill.
Monarch Telephone Mfg. Co., Chicago, Ill.
Frank B. Cook, Chicago, Ill.
Automatic Electric Co., Chicago, Ill.
National Carbon Co., Cleveland, Ohio.
American Conduit Co., Chicago, Ill.
Miller Anchor Co., Norwalk, Ohio.
Crawfordsville Wire & Nail Co., Crawfordsville, Ind.
Swedish-American Telephone Co., Chicago, Ill.
Eureka Electric Co., Genoa, Ill.
F. Bissell Co., Toledo, Ohio.
Holtzer-Cabot Electric Co., Chicago, Ill.
American Electric Telephone Co., Chicago, Ill.
Central Electric Co., Chicago, Ill.
American Electrical Works, Phillipsdale, R. I.
Gould Storage Battery Co., Chicago, Ill.
Valentine-Clark Co., Chicago, Ill.
Indiana Arm, Bracket & Pin Co., Indianapolis, Ind.
Crouse-Hinds Co., Syracuse, N. Y.

Several other companies were also represented at the convention.

A full report of the convention proceedings, entertainment and manufacturers, together with the papers read, will be printed in THE AMERICAN TELEPHONE JOURNAL'S issue of July 9th.

KANSAS CITY FIRE DEPARTMENT SWITCHBOARD.

WITHIN a few days the new switchboard will be installed at fire headquarters. This board is the property of the city. Up to this time the city has been using a switchboard belonging to the Bell Company, and had to pay an enormous rental, besides the Bell Company would not allow the Home Company to connect its telephones with the board. The new board is to have connections with both companies. It is wired for 120 trunk lines, so there will be plenty of room for direct connections with the larger corporations, who will appreciate this additional opportunity for guarding against a fire loss. The board is arranged in duplex, with places for two operators, so as to allow for any future growth.

BELL TACTICS IN GEORGIA.

AN illustration of Bell tactics as employed in the South, may be of interest to our readers. Some two years ago the Bell company went to Covington, Ga., and tried to bulldose Mr. C. C. Brooks, who owned the telephone system in that town, into the old worn out agreement of renting its telephones, with the usual claims of improved service to be gained thereby. As Mr. Brooks would not accept the proposition, the Bell company built lines and offered reduced rates to get a hold. Some people subscribed to the service, but in general the results were far from encouraging to the Bell interests. Mr. Brooks continued on the even tenor of his way in trying to serve the people with a telephone service that fitted their needs, and now has over 250 subscribers. The Bell company has but 20.

Only a few months ago, the Gainsboro Telephone Company, a sub-licensee of the Bell company, went to McDonough, Ga., and tried similar tactics with the local company there, owned by Mr. H. C. Bridges. Failing in this, it offered to buy the plant at one-third of its original cost. Of course, Mr. Bridges refused to sell, so the Gainsboro company built a system for the express purpose of destroying the business of the local company. Free service was introduced. The citizens, however, are standing by the local company and as it has connection with Atlanta through the Independent lines of the Atlanta Telephone and Telegraph Company, the need for using the Bell lines for toll services is done away with. Mr. Brooks has installed a large number of telephones in the farming district and is steadily increasing his business, notwithstanding the efforts of the Bell opposition.

OWENSBORO HOME COMPANY'S IMPROVEMENTS.

THE Home Telephone Company, of Owensboro (Kentucky), has bought a franchise for a telephone system in the town of Whitesville. The location is a promising one and bids fair to be very remunerative. The Home Company is also engaged in building an exchange in Maceo and in extending the lines of its West Louisville exchange to Delaware and Belch Grove. Extensive additions are also being made by this company to its exchanges at Stanley, Sorgho and Ensor. When these extensions and improvements are completed the Home Company, of Owensboro, will have a plant of exceptional value.

AN ENGLISH TELEPHONE EXHIBIT AT ST. LOUIS.

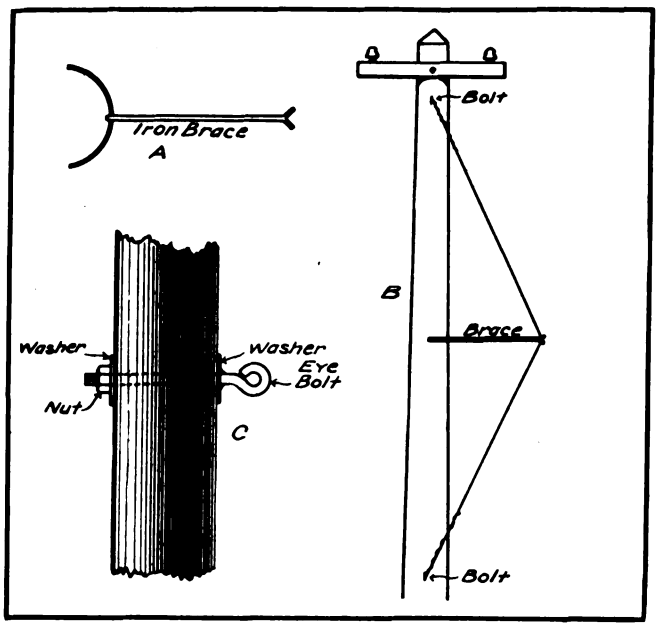
AMONGST the British exhibits of electrical machinery at St. Louis, will be one made by the Consolidated Electrical Company, of London. This company was one of the pioneers in the telephone industry in England, having been manufacturing apparatus for the past twenty years. The instruments represented are similar to those supplied to the British

Digitized by Google

Post Office, War, and Navy Departments, and consist of telephones, switchboards, lightning arresters, feeder and power panels, relays, transmitters, condensers, ante-shock receivers, portable marine apparatus, also specially designed apparatus for railway work, distributing boards, fuse panels, circuit breakers; in fact, almost everything in use in the telephone line, will be on view.

A POLE BRACE.

IT often happens in turning a corner with a line that there is no place where a guy wire can be fastened. As the strain upon the pole is often very great, the method of bracing illustrated herewith may prove of interest. Its method of application is self-evident from the drawing, in which *A* represents the



brace, *C* the bolt to hold the strain wire, and *B* the strain in position. Care should be taken in so placing the bolts for the strain wire that they bisect the angle formed by the two leads. In other words, the angle formed by the strain wire and a lead going in one direction should equal the angle formed by the strain wire and the lead goining in the other direction.

CONEWANGO VALLEY TELEPHONE COMPANY.

AS a result of the efforts of Mr. C. G. Mead, the work of developing the field for an Independent telephone system and the organization of an Independent Home Telephone Company has been completed.

The Conewango Valley Home Telephone Company, recently incorporated under the laws of the State of New York, with a capital stock of $10,000, is one more link in the strong chain of Independent systems.

This company will establish a first-class and thoroughly up-to-date local telephone exchange, with long-distance connections giving continuous service. The territory to be covered is about 25 miles square, through a prosperous farming section including the towns of Cherry Creek, South Dayton, Dayton, Forestville, Hamlet, Leon, Conewango Valley, Balcom, Millville, Cottage, Markhams and Wright's Corners.

This company has already perfected arrangements with the Inter-Ocean Long-Distance Telephone Company, which is building a through trunk line from Jamestown to Buffalo to connect its wires with the local switchboard.

The general headquarters and central office of the company will be located in the post-office building at Cherry Creek, N. Y. Following are board of directors and officers of the company:

Directors—E. B. Crissey, C. H. Lake, Dr. W. J. French, Dr. E. W. Storms, B. C. Wilson, G. W. Rood, H. S. Sweetland, E. B. Dye, A. H. Libby, E. J. Helmick and C. G. Mead.

Officers—Dr. W. J. French, president; G. W. Rood, vice-president; E. J. Helmick, secretary; H. S. Sweatland, treasurer; C. G. Mead, superintendent of construction and general manager.

A NEW OHIO TELEPHONE ASSOCIATION.

INDEPENDENT companies in Clark, Champaign, Miami, Logan, Shelby and Darke counties, Ohio, have perfected an organization to be known as the Miami Valley Telephone Association. This was effected at a meeting held at Piqua, which was presided over by Leo Flesh, of that city. M. B. Oberly, general manager of the United States Company, and J. S. Brailey, Jr., of the Central Construction Company, of Toledo, were present.

These men assured the members of the association that work would be started at once toward the construction of lines which will give every member direct connections with Chicago, Kansas City and several other of the larger western cities. There were 25 individual companies represented at the meeting. A committee was appointed to nominate permanent officers and adjourned to meet again in Piqua on the first of July to effect a permanent organization and elect officers.

Clark County has 2,400 Independent telephones; Champaign County nearly 3,000, and Miami County 4,400. Mr. Brailey, who is the head of the Central Construction Company, has been closely connected with President E. L. Barber, of the Home Telephone Company, of this city, for the last eight years.

A NEW PENNSYLVANIA COMPANY.

IT has developed that the recent sale of the rights and property of the New Jersey and Pennsylvania Telephone Company to J. Davis Brodhead, of South Bethlehem, was made in the interests of a syndicate of business men who will install a most up-to-date system in the towns of Easton and Bethlehem. The parties interested are: Malcolm Campbell, of New York City; W. A. Wilbur, R. M. Gummere, E. P. Wilbur, E. M. McIlvane and J. D. Brodhead, of South Bethlehem; J. W. Fuller, of Catasaqua; M. P. Quinn, of Philadelphia; H. Mutchler, of Easton, and M. Dodson and W. B. Myers, of Bethlehem.

The company will be known as the Easton & Bethlehem Company, and will include the lines of the New Jersey & Pennsylvania Company; the Warren Telephone Company, of New Jersey, and the Easton Telephone Company. Connections will be made with all the Independent telephone lines throughout the Lehigh Valley, and, by means of toll and trunk service, with the systems of the States of Pennsylvania, New Jersey and New York. The system in New Jersey comprises lines in Belvedere, Phillipsburg and Washington. Property has been secured in Bethlehem and Easton for new exchanges. Contracts for the new apparatus were placed some time ago and the equipment for the Bethlehem exchange is being installed.

A GROWING NEW YORK INDEPENDENT COMPANY.

ABOUT nine years ago the Orange County (New York) telephone Company started in business in Middletown. At the present time the local exchange has nearly 900 telephones. A year ago the number of subscribers was 590. The reason for this extraordinary increase is due partially to the exceptionally good service rendered by the company and also to the innumerable places to which one may talk without paying toll.

The Orange County Telephone Company made its first toll and connection with the Farmers' Telephone lines a year ago. At the present date it connects with over 20 exchanges of the Farmers' Union Company in New York and New Jersey, and also has 14 exchanges in its own system to which no toll charges are made. In all, a subscriber to this system can talk to upwards of 2,000 others with no extra charge other than the regular rate. Toll connections are made to lines of the Highland Telephone Company and also with Warwick, Chester, Newburgh, Poughkeepsie, Kingston and Catskill. Within a short while it will be possible to reach Albany over toll lines and that will mean that Orange County Telephone subscribers will be able to talk to Rochester and Buffalo. Through the Farmers' Company connection is made with the independent systems in New Jersey, and through these systems with the toll line companies connecting the principal Independent exchanges in the State of Pennsylvania.

TELEPHONE PATENTS

AN ELECTROMAGNETIC SIGNAL.

(No. 762,430) granted to F. R. McBerty, of Evanston, and F. H. Loveridge, of Chicago, and assigned to the Western Electric Company. This signal is shown in the accompanying illustration, which consists of two electromagnets, *a* and *a'*, which are secured to a soft iron frame, *c*. These two magnets are separated, and between them there are two armatures, *a2* and *b2*. The armature, *a2*, carries a projection, *d*, which, as is shown in Fig. 2, forms a target in front of the signal. This same armature can also, as is shown in Fig. 2, be arranged to operate a pair of jacks. The two armatures, *a2* and *b2*, are pivoted back to back upon

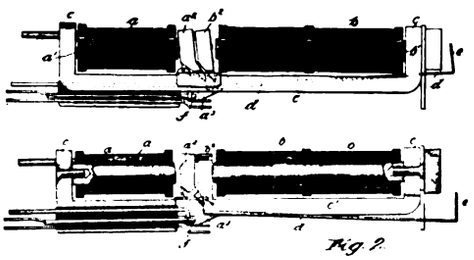

Fig. 2.

knife edges, and in such a manner that when neither magnet is excited the weight of the two armatures is sufficient to hold the armature, *a2*, in the position shown in Fig. 1, in which the target, *e*, is elevated and conceals the signal which is placed behind it. If magnet, *b*, is excited *b2* is drawn forward, then if magnet *a* is unexcited armature *a2* will follow armature *b2*, the target will drop and the signal display. On the contrary, if the magnet, *a*, is simultaneously excited, armature, *a2*, will be retained in its normal position, and no signal will be displayed. Thus it appears that the display of the signal appears upon the mutual excitation of the two magnets.

SWITCHBOARD SIGNAL.

In patent (No. 762,432) which is granted to J. L. McQuarrie, of Chicago, and assigned to the Western Electric Company, the use of the signal which is described in the previous patent is explained, for this patent covers a switchboard circuit which is particularly adapted to the employment of the signal. Of its de-

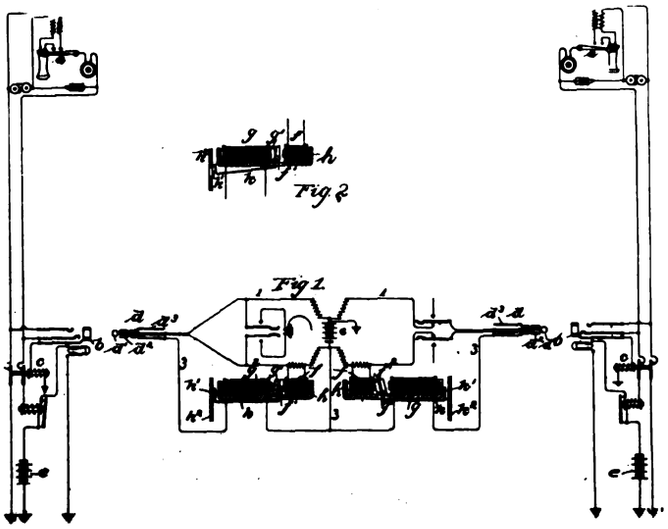

Fig. 2

Fig. 1.

scription in the accompanying illustration a pair of subscriber's stations of the usual description are shown connected to the central office and ending in the jacks, *b*. The usual subscribers' lamp signal, cut off relay, and common battery, *e*, are shown. The novelty of this device lies entirely in the cord circuit in which the signals previously described are indicated. It will be seen that the winding of the magnet, *f*, is included in the conductor, *2*, of the cord circuit, while the magnet, *g*, is included in conductor, *3*, which connects to the ring of the jack and thence to ground. It is thus evident that when the plug is not in any jack neither magnet will be excited and no signal will be displayed. As soon as the plug is inserted into a jack the magnet, *h*, becomes excited, and if then the subscriber's receiver is on the hook, the magnet, *f*, will not be excited and under these circumstances, as shown in the previous patent, the target will drop and a signal be displayed, whereas if the subscriber's receiver be off the hook, current will flow through winding *f*, armature *f'* will be retracted and no signal will be displayed. The object of the signal described in the previous patent is thus made evident.

TELEPHONE SELECTING DEVICE.

W. M. James, New Brighton, Minn., patents (No. 761,888) a selective signalling device. This invention falls into the category of step by step mechanisms. At each substation a revolving disc is provided in which a number of holes are drilled. This disc is operated by an escapement controlled by an electromagnet. Each impulse sent over the line causes the disc to revolve one notch and thereby enables any station to be selective.

IMPROVED TELEPHONE RELAY.

F. R. McBerty, Evanston, Ill., patents (No. 762,338) an improved telephone relay. This relay is shown in the accompanying illustration in Figs. 1 to 3, inclusive, the object being to secure a relay which can be economically manufactured so designed as to be made into banks that may be readily placed in a telephone exchange. The general features are shown in Fig. 3.

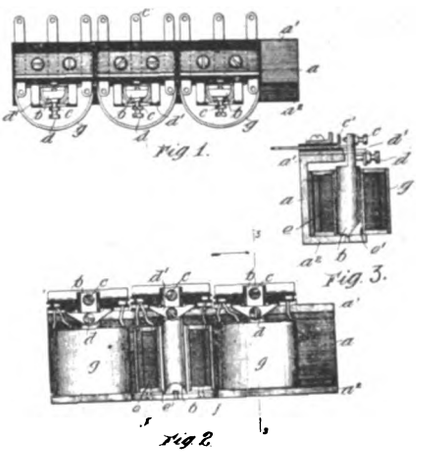

Fig. 1.

Fig. 3.

Fig. 2.

A is a channel-shaped piece of iron which carries a pivoted armature *b*. The exciting coil of the relay is shown at *e* placed around the armature and bolted to the channel piece *a*. The channel piece also carries contacts *c* and *c'*.. This device with a number of coils and armatures may be mounted one after the other inside of the channel line, which forms a common magnetic circuit and lends itself readily to placing the relays in banks.

CONNECTION COUNTER FOR TELEPHONE EXCHANGES.

C. E. Scribner, of Jericho, Vt., is granted a reissue, 12,232, of patent (No. 680,890), covering an improved counter for telephone exchanges. This reissue covers certain improvements in one of Mr. Scribner's early patents upon telephone exchange counters. The essential features consist in an escapement mechanism to operate a dial that indicates the number of messages which a substation sends. This mechanism is operated in conjunction with a relay so arranged that only when the called subscriber responds the counter device is actuated and at other times is magnetically locked.

QUERIES

Questions on any subject relating to telephony will be answered on this page.

CHARGINC CIRCUIT.—(363.)

Will you please explain how it is that battery can be fed on one side of a telephone circuit to charge a storage battery for a branch exchange.
C. T. P.

By referring to the diaphragm, Fig. 363, it will be seen that the line side which includes the line relay is connected to ground instead of to battery, as is usual, and that the mate side goes to battery instead of to ground. In this way it is possible to supply battery over the mate side. The reason why this method of connection is not always used is because the line signal acts as a guard upon the circuit, so that if it becomes grounded or shunted the signal will show up, whereas the circuit as illustrated could be grounded or shunted without any indication of the trouble other than a fuse blowing if the flow of current is excessive.

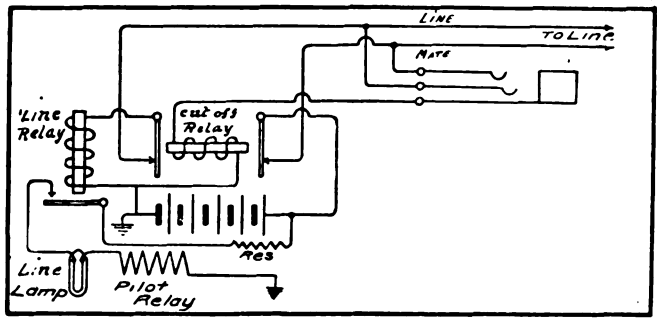

Fig. 363.

BOOKS ON INDUCTION COILS.—(364.)

Please give me further explanation of books on induction coils, and relative advantages of both (Norrie's and Bonney's). I want to make a coil capable of giving spark through from two to three and a half inches for wireless telegraphy and other experimental use. S. W. M.

It would be difficult for us to institute any comparison upon the two books upon induction coils which you mention, because both volumes are well written and contain much information. We infer from your query that you desire instructions for making a coil of a definite size, but we regret to say that we do not know of any volume which will give you exact information of this kind.

BOOKS ON INDUCTION COILS.—(364.)

We intend to build some new lines, and would like to know how many poles to use per mile that will make a well constructed line. Also, what size cross arms should be used, and the size of wire. One of the lines will be about 40 miles in length, the rest between 7 and 30 miles long. N. T. Co.

Not knowing the condition of the country through which you intend to build your lines, we can only give you approximate figures. Poles should average 33 to the mile for iron and 40 for copper. For single cross-arm lines they should be not less than 25 feet in length and have a circumference at the top of not less than 13 inches, and at six feet from the butt, 25 inches. It is economical to use tenpin arms where you will run three or more pairs of wires. The arms should be 8 feet long and have a cross section of 3¼" x 4¼".

Wire for circuits up to 12 miles should be No. 12 iron or No. 14 copper; for distances up to 50 miles, No. 9 iron or No. 12 copper.

LARGE OUTPUT GENERATOR.—(366.)

Will you please tell me what would be the best and most economical generator to use? We have a switchboard of 100 drops and country lines. The furthest we ring is sixteen miles. Have eight circuits and building more line. We have as many as twenty-two on one line. R. L.

From the outline of your system, that you have given, we believe that a six bar generator of good quality would be satisfactory for your work. It is necessary that it should be a good quality generator because, if not, the output of the armature will not be sufficient to operate all the bells, especially when you have such a large number as 22.

If you have water power at hand it would be economical, we think, to put in a water motor of about ⅛ horse-power and belt it to a large output generator. What is needed in your case is voltage and amperage. If you only had to ring two bells a distance of 16 miles you would require voltage the same as you do to ring 22 bells, but the amperage could be much lower than is necessary to ring the 22 bells.

DIFFERENCE IN CELLS.—(367.)

Is there any difference between the current of dry and wet cells? In operating a fan motor I find a dry cell lasts much longer than a wet cell. What is the cause? O. A. H.

There is no difference in the current of the two cells, excepting the output. A dry cell when new has a potential of about 1.4 volts and on a short circuit will give from 9 to 15 amperes, according to the area of the zinc and the size of the cell. A wet cell has an electromotive force of between 1.3 and 1.5 volts and a current output upon a short circuit from 7 to 20 amperes, according to the size of the zinc electrode.

In operation the wet cell becomes polarized very quickly, especially if the resistance it is working through is low, and consequently the electromotive force drops off to less than 1 volt, and of course the amperage is considerably lowered, too. A dry cell on account of its composition resists the polarizing effect to a much greater extent, consequently maintains its voltage and current output for a much longer period of time.

In all probability the resistance of your battery motor is very low, and the reasons we have stated above are the causes for the dry cell running the motor for a greater length of time than is found possible with the wet cell.

BELL FOUR PARTY INSTRUMENT.—(368.)

Please explain the connections of the Bell four-party magneto instruments.
L. I.

The bell connections are shown in Fig. 368. *C*, *D* and *E* are three binding posts within the bell box, and *a* and *b* are two flexible connectors. By means of these connections it is possible to so arrange the bell with reference to the polarity of the ringing current and the bias spring *s* as not to operate except under the proper conditions. The four connections possible are: (1) *a* to *C*, *b* to *D*; (2) *A* to *D*, *B* to *C*; (3) *A* to *D*, *b* to *E*, and (4) *a* to *E*, *b* to *D*. By means of ringing keys at the exchange, it is possible to send either positive or negative pulsating current over either side of the line at will.

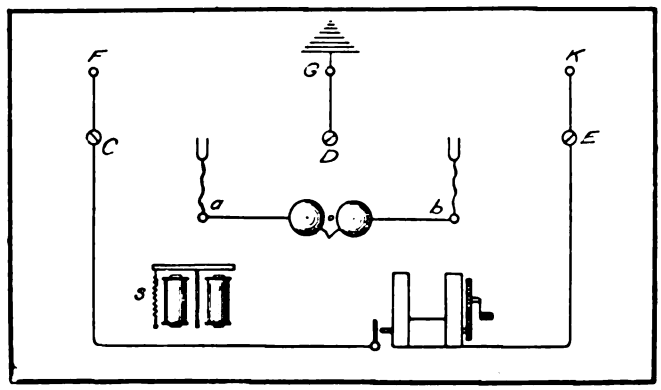

Fig. 368.

The generator at the sub-station generally has only two magnets. This is because in signaling the large output of current would ring the bells of the other stations.

THE WEEK'S MESSAGES

FINANCIAL.

LOS ANGELES, CAL.—A meeting of stockholders of the San Fernando Valley Home Telephone Company has been called for August 11th, 1904, for the purpose of voting on a proposition to create a bonded indebtedness of that corporation in the amount of $40,000, with interest at 5 per cent. per annum.

CHAMPAIGN, ILL.—The Home Telephone Company, of Champaign, has increased its capital stock from $25,000 to $100,000.

TUSCOLA, ILL.—The Tuscola Telephone Company has increased its capital stock from $5,000 to $10,000.

BOSTON, MASS.—The directors of the American Telephone & Telegraph Company have declared the regular quarterly dividend of 1½ per cent. and ¼ of one per cent. extra, payable July 15, to stock of record June 30. The company's books will close July 1 and reopen July 15.

WESTMINSTER, O.—The United Farmers' Telephone Company, of this town, has increased its capital stock from $10,000 to $20,000.

CAROLINE, WIS.—The Farmers' Independent Telephone Association, of Caroline, has increased its capital stock from $1,000 to $2,500.

FRANCHISES.

MENDOCINO, CAL.—John McClish has petitioned the board of supervisors of Sonoma county for a 25-year franchise to construct, operate and maintain a telephone system in that county.

MUNCIE, IND.—The Delaware & Madison Counties Telephone Company has secured a franchise admitting it to all towns in Madison County. Work on an exchange in Frankton has been begun.

COUNCIL BLUFFS, IA.—A meeting of citizens interested in the project for an Independent telephone exchange in Council Bluffs, held a meeting recently to draft articles of incorporation, and a franchise ordinance to be presented to the city council.

HANCOCK, MICH.—C. L. Wright appeared before the city council recently in behalf of the Automatic Telephone Company, requesting the council to grant his company permission to construct a telephone system in this city.

HASTINGS, NEB.—The Hastings Independent Telephone Company has asked the city council for a franchise. The company agrees to lay all wires underground and to have 400 telephones in operation before charging for service.

MIDDLETOWN, O.—The Middletown Telephone Company has brought suit in the probate court, through its attorneys, Charles H. Bostler and Albert Emanuel, against the city of Middletown to secure the right to construct, maintain and operate a telephone system in this city.

WAYNE, PA.—F. A. Wunder, representing the Keystone Telephone Company, of Philadelphia, appeared before the commissioners of Lower Merrian township to ask for a franchise.

WATERTOWN, S. D.—The Dakota Central Telephone Company has been granted a 20-year franchise by the city council to operate a local telephone exchange. The wires in the business part of the city will be laid in conduits.

MONROE, WASH.—The newly organized Tualco Telephone Company has applied to the county commissioners for a franchise to construct a line from Monroe to Cherry Valley.

ELECTIONS.

GRANVILLE, ILL.—The Granville Telephone Company has elected W. B. Sill, president; A. D. Fisher, vice-president; B. B. Blosser, secretary, and W. P. Magee, treasurer. C. M. Chase, John Kunkle, W. E. Hawthorne, C. W. Dysart and Olaf Matson, directors.

TERRE HAUTE, IND.—The Citizens' Telephone Company has elected the following officers: W. P. Ijams, president; Fred B. Smith, vice-president; C. R. Duffin, secretary, and G. A. Conzman, treasurer.

STORY CITY, IA.—The Story City Telephone Company has elected A. M. Henderson, president; J. E. Cagwin, vice-president; T. T. Henryson, secretary; P. C. Christianson, treasurer. J. E. Cagwin, A. M. Henderson, M. Henderson, Joseph Marvick and E. L. Erickson, directors.

ST. PETER, MINN.—At the annual meeting of the Nicollett County Telephone Company, the following officers were elected: M. P. Quist, president; C. Samuelson, vice-president; C. C. Nelson, secretary and manager, and P. A. Retrum, treasurer.

VIBORG, S. D.—E. C. Nelson has been elected secretary of the Viborg and Center Point Telephone Company.

LA CROSSE, WIS.—The following officers have been elected by the board of directors of the La Crosse Telephone Company: President, I. H. Moulton; vice-president, W. W. Gargill; secretary and treasurer, W. F. Goodrich.

COMBINATIONS.

LANESBORO, IA.—The Lanesboro Mutual Telephone Company has purchased the local system operated by J. V. McCoy.

SUMNER, IA.—Fred Pieggenkuhle, residing near Hockeye, has purchased the property of the Sumner Telephone Company for $7,100. A new line will be put in to West Gate, Maynard and Randalia. Many other improvements are contemplated.

MOUNT CALM, TEX.—Z. R. Young has sold the Mount Calm Telephone exchange to E. T. Nickels.

PERSONAL.

S. P. GRACE, chief engineer of the Central District and Printing Telegraph Company, of Pittsburg, has had the honorary degree of "Master of Engineering" conferred upon him by the State University of Michigan.

F. W. HEIDEL has been appointed manager of the Central New York Telephone Company.

UNDERGROUND.

ST. PAUL, MINN.—The Northwestern Telephone Company has been authorized to place its wires in certain streets in underground conduits.

BLOOMINGTON, ILL.—The Home Telephone Company has just completed the stretching of a new underground cable on Jefferson street, between Main and Madison streets, to accommodate new service in the business district.

MISCELLANEOUS.

LAKE CITY, MINN.—The Northwestern Telephone Company has removed its officers to a larger building on account of the growth in business, and will institute a night service.

JERICO, MO.—The Jerico Telephone Company lost its central office by fire last week. They expect to rebuild at once.

NEW COMPANY NOTES

SANTA ROSA, CAL.—The Westside Telephone Company, of Healdsburg, has been incorporated by J. McLish, M. V. Frost, and others.

CIRCLEVILLE, IND.—The Circleville Telephone Company has been incorporated here with a capital of $5,000.

URBANA, IND.—The Urbana Independent Telephone Company has been incorporated with a capital stock of $10,000, and will build an exchange in Urbana, Wabash county. Adam Cook, E. F. Baker and Emanuel Stover, directors.

VEVAY, IND.—The Farmers' Mutual Telephone Company has been incorporated here with a capital of $6,000, to construct and operate telephone lines in Switzerland county.

WILMOTT, IND.—The Wilmott Mutual Telephone Company has been incorporated with a capital stock of $10,000. An exchange will be built in Wilmott, and the lines extended in Whitley county. The chief incorporators are F. E. Baker, Emanuel Staver and Adam Cook.

HOLSTEIN, IA.—The Cushing Telephone Company has been incorporated with an authorized capital stock of $9,000. The officers are: President, H. H. Lunud; vice-president, James Holcomb; secretary-treasurer, W. F. Hutton.

WELDON, IA.—The Smyrna and Weldon Telephone Company has incorporated with a capital stock of $250, with the power to increase the capital to $500. The following directors were elected: W. N. Hall, T. B. Jamison, Geo. A. Beattie, Arthur Hoover and John Cannon.

GODDARD, KANS.—The Goddard Telephone Company has been incorporated here with a capital stock of $2,500. The officers are: W. D. Strong, president; H. C. Sinbur, vice-president; L. T. Smith, secretary, and W. H. Dwight, treasurer.

HOME CITY, KANS.—The Home City Telephone Company has been incorporated with a capital stock of $2,100, and work is to begin at once.

CAMBRIDGE, ME.—The Cambridge Telephone Company has been incorporated with a capital stock of $10,000, to give telephone service in this vicinity. The officers are: T. J. Hersey, president, and D. F. Clark, treasurer, both of Cambridge.

NEW SWEDEN, MINN.—The Farmers' Co-operative Telephone Company has been incorporated with a capital of $12,000. The officers are: J. H. Nutter, president, and E. B. Rounsville, secretary.

SHAKOPEE, MINN.—The Shakopee Telephone Company nas been incorporated here by J. B. Ries and others.

WOODBURY, N. J.—The People's Rural Telephone Company has contracted with the Eastern Company for long distance calls. Nearly every farmer in the county is a subscriber. The central station will be in Wenonah.

PRATT CITY, O.—The People's Telephone Company is extending its lines to Sandusky. The company is also making extensive improvements in its service in this city. During the last month thirty new subscribers have been added, making a total now of ever 150.

BAY CITY, TEX.—The Bay City and Matagorda Telephone Company has been incorporated with a capital of $5,000. The incorporators are: W. W. Boulder and R. H. Taylor, of Bay City, and A. W. McNabb, of Matagorda.

BEN WHEELER, TEX.—The Central Telephone Company has been incorporated with a capital of $5,000, by W. J. Steward, A. J. Adboni and J. A. Reynolds. They will construct and operate an exchange here.

UNION BLUFF, TEX.—The Union Bluff Telephone Company has been incorporated by G. H. Garrett, H. Daniell, H. D. Bookout and R. T. Bookout, and will begin construction at once.

WAXAHATCHIE, TEX.—The Mutual Telephone Company has been incorporated with a capital stock of $50,000, to construct and operate lines in Ellis, Dallas, Kaufman, Hill, Navarro, Johnson and Tarrant counties. The incorporators are: John M. Harrison, of Waxahatchie; P. M. Wheatley, of Weatherley; W. A. Lewis, of Howard; W. A. Culbertson, of Sterrett; J. B. Wiley, of Ovilla.

CONSTRUCTION.

LAYTONVILLE, CAL.—The Pacific Telephone Company, of Mendocino county, with lines from Covelo to West Port and from Laytonville to Cahto, has decided to extend its system from Laytonville to Sherwood. The officers of the company are W. S. Pinches, W. F. Wade, and C. Ira Brown. It has a capital stock of $25,000.

ST. JOHNS, N. B., CAN.—The Penfield and St. George Telephone Company is making extensive improvements, and will connect with Deer Island, Eastport and Campobello.

COLORADO SPRINGS, COLO.—The Colorado and Midland Railway Company has equipped its line with a telephone system.

Digitized by Google

MANCHESTER, ENG.—A corporation of Manchester will install a municipal telephone system in co-operation with a dozen neighboring towns.

EUSTIS, FLA.—Henry W. Bishop is arranging for the construction of telephone service to Lake county. The city council recently gave him a 20-year concession with liberal privileges.

CHICAGO, ILL.—The management of the Illinois Central Railroad Company is considering plans for the expenditure of about $400,000 for rebuilding and re-equipping its telephone system. The present system, which has cost the company a large amount of money, has been found to be inefficient for distances of over 400 miles. The wire weighs about 175 pounds to the mile, whereas experiments have shown that wire weighing more than 400 pounds must be used.

WASHINGTON, ILL.—The Washington City Rural Telephone Company is installing 1,000 feet of new aerial cable to accommodate the growing needs of the service.

WATSEKA, ILL.—The Watseka Home Telephone Company will extend its line to Crescent City and Pitwood.

ATLANTA, IND.—Warner Goodykoontz, who operates the Atlanta Telephone plant, proposes to extend the Atlanta line to Tipton, Ind.

BLOOMINGTON, IND.—The new Bloomington Telephone Company has decided to expend $25,000 in improving the local system. The old poles will be replaced with larger ones, so as to place the wires above the electric light wires.

BRAZIL, IND.—The Citizens' Telephone Company has extended its lines to Lewis.

GOSHEN, IND.—The Elkhart Home Telephone Company will expend $6,000 in new cables in Goshen and additional switchboards for both Goshen and Elkhart.

KIRKLIN, IND.—D. L. Thompson is preparing to rebuild the telephone lines in Kirklin. The system now has over 270 telephones.

MUNCIE, IND.—The Mt. Pleasant Telephone Company has practically completed its construction. The company has about 100 farm lines and half as many city lines, and will have two direct trunk lines connecting this city with Medford, Ind.

ODEBOLT, IA.—The state board of control has let the contract for a new telephone system for the State hospital at Cherokee to the New State Telephone and Telegraph Company, of Odebolt.

SHELL ROCK, IA.—The Shell Rock Telephone Company is rapidly extending its system on account of demand for service by farmers in this vicinity.

BELOIT, KANS.—The Solomon Valley Telephone Company is contemplating purchasing a new magneto switchboard, so arranged that it can be changed to central battery board.

ELDORA, KANS.—The Eldora Mutual Telephone Company is about to spend $2,350 on improvements.

HARRIS, KANS.—The Harris Telephone Company will begin the construction of its toll line to Garnett, Kans., at an early date.

IOLA, KANS.—Mr. C. J. Peterson, of Iola, has been promoting a farmer telephone company at Elsmore. He will begin construction work at once.

LOUISBURG, KANS.—The Farmers' Mutual Telephone Company, of Louisburg, will build toll lines to West Line and Cleveland, Mo., this summer.

MOUND CITY, KANS.—The Mound City Telephone Company will build to Kincaid, Kans., in the near future.

NORTON, KANS.—Joseph H. Young, manager of the Central States Telephone Company, has been several days in Kansas City, Mo., looking over the plant of the Home Telephone Company.

WILLIAMSBURG, KANS.—Mart Getchell, of the Williamsburg Telephone exchange, reports that the farmer lines business is very heavy this spring and expects to extend several new lines during the summer.

MAYSVILLE, KY.—The Maysville Telephone Company is extending its toll line connections in every direction.

BREAUX BRIDGE, LA.—Citizens of this place are arranging to organize an Independent telephone company, to construct and operate an exchange in this town and toll lines to St. Martinville and other points. The town council will be petitioned at once to grant a franchise.

BLAINE, ME.—The Farmers' Telephone Company is still extending its line, and is putting in many new instruments. The line extends into New Brunswick, and will also be built to Houlton and Presque, Maine.

PORTLAND, ME.—The Northeastern Telephone Company has made arrangements to install a secret service telephone system in the general offices of the Grand Trunk Railway.

LEONARDTOWN, MD.—J. F. Coad, of Leonardtown, J. Canter, of the South Maryland Telephone Company, have announced that the line from Mechanicsville to Leonardtown would run to Laurel Grove and Morganza. Mr. Coad states that orders will at once be given for the construction of the line, and actual work will be commenced as soon as he can buy poles.

BALDWINSVILLE, MASS.—The Templeton Street Railway Company will install a telephone system along the line.

ANN ARBOR, MICH.—The Co-operative Telephone Company, which recently opened its new Ann Arbor line, is doing some very fine business. Nearly 1,000 lines have been placed in the northern section of the city, and the big switchboard is being put into shape to take care of the additional business.

YPSILANTI, MICH.—The Washtenaw Home Telephone Company is installing an exchange in the city. Work is in progress stringing wires, and toll stations have been placed in the two leading hotels.

HECTOR, MINN.—The Social Telephone Company will extend its line to Britton, via Newark, Havana and Kidder.

WILLMAR, MINN.—The Tri-State Telephone Company is building a first-class three circuit copper toll line from the Twin cities to Grand Forks, via Willmar.

KANSAS CITY, MO.—It is planned to run an Independent telephone line along the right-of-way which the Standard Oil Company is buying for its pipe line from the Kansas oil fields to the refinery here. This line will connect with the Kansas City Home Telephone Company.

AINSWORTH, NEB.—The Keyapahupa and Brown County Telephone Company will build a new metallic circuit to connect with other towns in the vicinity.

NELSON, NEB.—The shipment of material for the Nuckolls County Telephone Company has arrived, and work will be pushed on the construction.

SYRACUSE, NEB.—The Farmers' Telephone Line, northwest of town, is making arrangements to construct its lines to Syracuse and connect with the Independent telephone system. Farmers north of town have about decided to take a similar step.

NEWPORT, N. H.—E. B. Hayward and others are soliciting subscribers to an Independent telephone system here.

PRINCETON, N. J.—The Interstate long distance telephone company is now stringing several wires from Trenton to Princeton. A great improvement in the service of the local telephones in Princeton is now being made.

ALBANY, N. Y.—The recently organized Home Telephone Company has commenced work on its plant and expects to be ready for operation before the beginning of August.

ALEXANDER, N. Y.—The Darien and Alexander Telephone Company has extended its line on account of the increased number of subscribers.

COHOES, N. Y.—The Home Telephone Company will move its exchange to larger quarters on account of extensive business, and will build new lines to Crescent, Colonie and Mechanicville.

AUSTINBURG, O.—A local telephone company has been organized here, and will build lines into the country districts in all directions.

COLUMBUS, O.—The Citizens' Telephone Company will install a new switchboard as soon as its new building is completed. It is expected to have, by January 1st, upwards of 8,000 subscribers.

EASTON, PA.—The old New Jersey and Pennsylvania Telephone Company will be reorganized under the name of the Easton and Bethlehem Telephone Company, with headquarters in the two towns. The lines will be improved. The reorganizers are: Malcolm Campbell, of New York; Warren A. Wilbur and J. Davis Brodhead, of South Bethlehem; W. B. Meyers, of Bethlehem; James W. Fuller, of Catasaqua; Martha P. Quinn, of Philadelphia; Charles M. Dodson, of Bethlehem; R. M. Gummere and E. P. Wilbur, of South Bethlehem, and E. M. McIlvaine and Howard Mutchler, of Easton.

ERIE, PA.—The directors of the Mutual Telephone Company have voted to increase the switchboard facilities from 2,000 to 3,000 lines.

HOMESTEAD, PA.—The Pittsburg and Allegheny Telephone Company will install a central energy system within the next thirty days.

MEADVILLE, PA.—The Meadville Telephone Company is installing a switchboard at Conneaut Lake, and has extended the Harmonsburg line to that Exchange.

BUCHANAN, VA.—O. E. Obershain will probably be given the contract to construct a telephone line connecting Big Island with Bedford City.

WHEELING, W. VA.—The Baltimore & Ohio Railway Company are installing a telephone system in their offices in this vicinity, and is connecting with all of the heads of departments from Holloway to Benwood and this city.

JANESVILLE, WIS.—The directors of the Rock County Telephone Company have ordered many improvements in the country districts near Janesville. A three mile extension will be made towards Johnstown. Extensions will be made to the La Prairie line.

KENOSHA, WIS.—The Wisconsin Telephone Company will expend $500,000 in improving its line during the summer.

WHITE BEAR, MINN.—The Twin City Telephone Company has completed its system in this city, and has now 125 subscribers and trunk connection with St. Paul, Minneapolis and all other points reached by this company. The system installed was common battery.

SHELDON, MO.—The Sheldon Telephone Company, which is constructing a system here, will have to make large extensions on account of the number of new subscribers secured.

ALBANY, N. Y.—The Rensselaer County Telephone Company will extend its system to the city of Rensselaer in the near future.

CHARLOTTE, N. Y.—The Charlotte Telephone Company is building a system here that will connect with the Inter-Ocean Company's lines. Connection will also be made with Rochester through the Rochester Telephone Company's exchange.

MARCY, N. Y.—Work on the Marcy exchange of the Utica Home Telephone Company's system is nearing completion. It is expected to have over 100 subscribers for a start.

PLATTSBURG, N. Y.—The Clinton Telephone Company, which was granted a franchise in this town last year, will commence the construction of its plant at once. The franchise granted this company requires that its lines shall be run underground in the business section, the conduit to be built by the company and one duct to be reserved for the use of city wires.

UTICA, N. Y.—The Home Telephone Company has found it necessary to increase the capacity of its system, on account of the large number of new subscribers secured.

ADDISON, N. D.—Richard Piper, president of the Rural Telephone Company, is making arrangements for the extension of the lines from Lynchburg to Addison and Davenport.

CALDWELL, OHIO.—A. N. Dowling, representing the Caldwell Independent Telephone Company, was at Lowell recently, making arrangements for the construction of lines to that place and the probable installation of a switchboard there.

CAMDEN, OHIO—The Camden Telephone Company is rapidly extending its system. New lines are being built in all directions and it is hoped that it will be possible to connect with the lines of the Home Telephone Company at Hamilton within a short while.

OIL CITY, PA.—W. S. Paca, president of the Petroleum Telephone Company, states that the company will make extension of the lines from Hydetown to Titusville, Townville and Guy's Mills. The Meadville Telephone Company, of Meadville, will construct an extension to Guy's Mills, giving through connection from Oil City to Meadville.

RIDGEWAY, PA.—Tri-County Telephone Company connects with Elk Telephone and Telegraph Company, of St. Marys, with Simmerville Company's lines at Du Bois, Armstrong, Jefferson, Clearfield and Clarion counties; with lines of the Union Telephone Company, Pittsburg to Erie.

BERESFORD, S. D.—Work has commenced on the new telephone line which will connect Beresford with the farming region southwest of this city.

BRYAN, TEX.—E. L. Palmer and J. Kyle have built a telephone line at Rogers Prairie to connect with the system in the town.

NEOLA, TEX.—Dr. O. A. Armstrong, Frank Baird, L. M. Vickers, Alfred Woods, the Rev. S. L. Crosson and John Hayter, of this place, will construct a telephone line from Neola to Greenville and install a local switchboard.

SHERMAN, TEX.—The directors of the Grayson County Telephone Company have ratified the sale of six miles of their lines between Dennison and Red River to the Pioneer Telephone and Telegraph Company. At the meeting it was announced that the new line between Sherman and Texarkana would be built at once.

VERNAL, UTAH—The Vernal & Fort Duchuesne Telephone Company has decided to extend its lines to Jensen.

CHEHALIS, WASH.—The telephone line of the Home Telephone Company, of Silver Creek, has now reached this town. The line extends into the country thirty-five miles and is the longest rural telephone circuit in operation in western Washington.

TRADE NOTES

The Sterling Electric Company, Lafayette, Ind., has just finished sending out a complete folder describing its various protective apparatus. This folder will be sent to any one for the asking.

The F. Bissell Company, of Toledo, Ohio, reports unusually large sales of its Marline cable hangers. The company finds it difficult to keep ahead of the demand, although working an extra force of men in its factory.

The H. H. Franklin Mfg. Company, of Syracuse, N. Y., has issued an attractive booklet entitled "The Cast of a Die," which illustrates in a forceful manner the adaptability of its process of die casting for intricate mechanical parts. This company also wishes to call the attention of the trade to the fact that no other concern is licensed to sell "finished castings" under its processes or patents.

The Central Telephone and Electric Company, of St. Louis, Mo., has purchased the buildings formerly occupied by the Missouri Medical College. The buildings have a frontage of 83 feet on Lucas avenue, and a depth of 145 feet on Twenty-second street. The lot is located in the factory district, and on account of the substantial character of the buildings is considered a very desirable property. The company will use the buildings for a factory and store room.

The Connecticut Telephone and Electric Company, of Meriden, Conn., has just issued its new catalogue No. 8. This issue is most complete, covering exchange apparatus and also a large line of interior telephone systems. The Connecticut Company has as large a line of apparatus as any other telephone company, and it is manufacturing all parts from the raw material in its own factory. A copy of the new and enlarged catalogue will be mailed on request, also the various bulletins.

Mr. Frank B. Cook has recently returned from a trip to the Black Hills, where he has been looking after his interests in the Deadwood Home Telephone Company, which he owns. He reports the Company in a flourishing condition and says that it is rapidly passing its Bell rival in the competition for subscribers. Mr. Cook returned by way of Omaha, Council Bluffs, and Des Moines, where he called on the trade.

The International Telephone Manufacturing Company, of Chicago, reports an increasing demand for its never failing self-restoring drop switchboard, and also for its various types of telephones, including the four-party selective equipment. Among recent installations made by this company in Indiana might be mentioned switchboards and equipment for the Daleville Telephone Company, Summitville Telephone Company, Medford Home Telephone Company, and Frankton Telephone Company. These exchanges are equipped throughout with International express type or mechanical self-restoring drop switchboards, International series exchange and four-party line selective telephones.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE—The Ottumwa Telephone Company's plant at Ottumwa, Iowa, including Franchise and all its property. The Company owns the three-story brick building, built two years ago, in which is installed a Central Energy System, equipped for 1,540 full metallic lines, with selective ringing apparatus, all of the latest and the best. 1,250 telephones are installed, with 250 names on the waiting list. The Company also owns 80 miles of toll lines. This is one of the best telephone propositions in the State of Iowa. For full particulars, maps and photographs, address the Citizens' Savings & Trust Company, Cleveland, Ohio, or Henry S. Herr, Ottumwa, Iowa. 187

FREE Sample to Agent. Practical ready call device for telephones. Saves brain work and hours of time. Sells itself. One sale sells dozens. Seeing is believing. Send stamp. The Telephone Appliance Co., One Madison Avenue, Dept. A. T. J., New York City. 193

FOR SALE—Switchboards and Telephones, all capacities and makes, Terminals, Cross-connecting Racks, Cable, &c., at less than half cost of new. Guaranteed reliable and efficient. Chicago Telephone Apparatus Exchange, 17 S. Elizabeth St., Chicago, Ill. 184

FOR SALE—Controlling interest in telephone company. Incorporated for $5,000. Good, new plant. Good town. For full particulars write. GEORGE CRESS & CO., Effingham, Kas. 200

The 1900 Dry Battery

THE most needed quality is reliability. No one wants a battery that will respond all right for a week or ten days then "suddenly go out of business." Another requirement is that it shall continue "strong" during its life. These two requirements besides many others are characteristics of

1900 BATTERIES

We guarantee them not to freeze, leak or break; we warrant them to work with a strong, steady current during their life (anywhere from six to eighteen months).

They are compact, always ready. They are better than wet batteries—no slop, no repairs, no breakage. Any one can replace a worn out one at a moment's notice. They can be carried anywhere—always ready for instant use.

Write us for our Complete List of Batteries and Telephone Supplies

THE AMERICAN TELEPHONE JOURNAL

Best in America!
Best in the World!!---

A great many times we have made this assertion, simply on the verdict of our subscribers. Here is another just received that is quite convincing :

> "I take the opportunity of assuring you that my interest for your journal is as great as ever. Considering its very instructive articles, its weekly issue, and reasonable price, I certainly think it is the best telephone paper, not only for America, but for all the telephonic world.
>
> "BERTIL BRANDER,
> "Telephone Engineer,
> "Berlin, Germany."

If the Journal is so valuable to a foreign telephone engineer, it must be twice so to an American Independent telephone man

Gentlemen:-

In referring to your favor of the 1st., will say that it gives me much pleasure to state that the companies I represent have in the neighborhood of fifteen hundred Swedish-American telephones working , both central energy and magneto , bridging and series , desk sets of both systems . They are giving entire sarisfaction .

In addition to the satisfaction derived from the use of your equipment , our companies have always found your house willing and ready to promptly rectify any defects that have shown up in the use of so many instruments , in addition , according to us all the courtesies that any one could reasonably ask .

The telephones and treatment have been entirely satisfactory.

Yours truly
Theodore Gary

THE TELEPHONE IN THE JAPANESE ARMY

IT may perhaps have occurred to our readers that the wonderful successes that have fallen to the lot of the Japanese army in its conflict with Russia, have been due in a measure to some superior method of signalling not possessed by the opposite forces. In a great measure this is true, and it is to the successful use of the military telephone that some of the greatest strategical movements have been made. The use of the telephone as an adjunct to military campaigning dates back to the Spanish-American War, when its successful use both in Cuba and the Philippines made it at once one of the greatest necessities and aids to military work.

When General Kitchener laid his plans for the successful defeat of the Arab dervishes in the Soudan, two years were spent in reconnoitreing and laying plans which culminated in the final battle of Omdurman. It was here that the telephone demonstrated in a particular manner its desirability in place of any other method of signalling. The Arabs were never known to attack except at such times when they supposed the British troops were not ready to repulse them, consequently though scouting forces were sent forward to secure details of the country, it was not practical in many instances to use the heliograph, on account of its betraying their position, which would result from the flashing of the signals, but with the telephone this difficulty was overcome, and communications and orders were given from the general officers' headquarters without in any way interfering with the ultimate result of the movement contemplated.

A Japanese Telephone Outpost.

The Japanese are notable for their ready adaption of the highest class of military tactics and their engineer corps, which takes the place of the signal service in the United States, is probably one of the best officered and manned departments that has ever been with an army corps. The battle of the Yalu River brought to the front in a forcible manner the advantages to be secured by means of the telephone. The town of Wiju was used as a base from which to direct movements of the main army. Telephone lines were strung out to both flanks of the attacking lines and also to the center portion of the advancing forces. By means of the telephonic communications the Japanese were able to surround the Russians, and effect a capture of 28 guns. The telephone engineers are men who have had thorough technical and practical experience in the telephone business; in fact, are civilians who have only donned the uniform as the emergency demanded, and it might be said here that the major portion of the Japanese army is estimated to be made up of civilians, who like our own National Guard, have come to the front as an efficient fighting force.

The difficulties necessary to maintain a telephone line through a hostile country are many and varied, and not the least requisite is one of great moral courage. In building military telephone lines, the topography of the country has to be considered, and in the case of the Japanese advance through Corea, difficulties of great magnitude had to be overcome. Yet with it all, at frequent times, the telephone department of the engineering corps completed its line in advance of the troops even under forced marching. The necessary implements and apparatus were carried whenever possible in bullock carts, but as the lines advanced into wild country where roads even of the miserable character which had served as a passageway for the wagons ceased, then it was necessary for the coils of wire to be slung over the shoulders of the men and carried great distances on foot. Our illustration shows an engineer post in the village of Sunam. It might be well to draw the attention of the reader to some particular points of interest which might not evidence themselves. It will be noticed that there are three lines entering the hut, and also that there are three men apparently engaged in receiving and transmitting telephone communications. One of these men acts as a transmitter in reporting the news to the commanding

Digitized by Google

officer, another listens to the commands as they are received and writes them out, the third checks the message both ways. In this manner a large amount of accuracy is obtained and the reports and commands are successfully transmitted. The reason for the use of three is perhaps obscure to the mind of the average telephone user. It must be remembered that in the rapid work of construction which is necessary under these conditions, that the adjustment of the apparatus is not of the best. The crude construction does not admit of the best results according to commercial standpoints, consequently to avoid errors the number of men engaged upon the work of transmitting and receiving messages is increased. When the war is over and the censorship is withdrawn from the reports of foreign correspondents, it is believed in military circles that the use of the telephone from a military standpoint has done more toward successful manœuvres during a campaign than has the sheer force of arms.

An interesting point which thoroughly illustrates the desirability of the telephone as a means of rapid communication was given at the battle of the Yalu. When the right and left wings of the Japanese army were swinging round the ends of the defending forces of the Russians, the artillery of one of the flanks for a moment was directing its fire into the opposite Japanese flank. However, the telephone rose to the occasion and within a few moments orders had been given from the headquarters at Wiju which changed the range of fire and so saved many lives. Similar unfortunate accidents have occurred before, noticeably during the Civil War, but then the telephone had not been invented, and there were no methods for rapidly communicating orders except by flash signals, and in dull weather even this means was impossible and messengers had to be used.

TELEPHONE CONDITIONS IN GREAT BRITAIN AND THE CONTINENT OF EUROPE*

By M. S. Connor.

THE telephone situation outside of the United States presents many features worthy of consideration. The majority are of value to strengthen faith in American practice and prevent experiments that would often result disastrously. But there has been considerable work on the other side that is commendable, and well worth careful study.

In England the telephone business vested by law in the hands of the General Post Office. When the telephone appeared the Post Office officials farmed out its exploitation. As a result the Kingdom was divided among several operating companies independent of each other. After a few years the Post Office assumed control of the long distance lines and the several operating companies were consolidated into the National Telephone Co. (Ltd.). This company was given a new charter which expires in 1911, and there is much agitation as to what turn telephone affairs will take. The English people entertain a feeling for the National Telephone Company similar to that toward the Bell interests in this country. There is no doubt that this feeling is merited, but the National Telephone Company have some excuse, as they know that their lease of business existence has but a short time to run and as they cannot tell what the future has in store, they have decided to "make hay while the sun shines."

The Post Office has now entered the operating field in London and have several general agency exchanges in operation. It is working in harmony with the National Telephone Company, charging the same rates and trunking between both systems. In England a trunk line is called a junction line, and a toll line a trunk line.

The action of the Post Office is taken by many to mean that it contemplates, sometime, purchasing the business of the National Telephone Company; that it is now principally interested in seeing that the telephone material installed will be of use in the future, and in getting sufficient experience to handle the business.

The career of the National Telephone Company has been filled with many hardships, as it has had to contend with extraordinary harsh treatment by various municipalities. It has never been able to get street rights in London and, all the lines are overhead with the exception of the wires rented from the Post Office. Overhead wires are mounted on horses, are fastened to the tops of buildings, necessitating a contract with each householder. Many times it has been necessary to move an entire run merely to satisfy the whim of some land owner who refused to have them pass over his property any longer.

Many of the exchanges installed by the National Telephone Company have been schemes that have been thoroughly tried in this country and proved failures, such as flat switchboards, call wire systems and ringing through systems. Only two years ago a large switchboard was installed in Edinburgh on a ring thorough system, and now, it is reported that this board has been converted into a straight central energy one.

The work that the British Post Office is doing in London, leaves little to be desired. From a switchboard and operating point of view, they have copied from the New York Telephone Company. Their underground system and cable distribution might be said to be a copy of that in Paris.

In England practically all of the telephone material is imported. The majority of the apparatus used is manufactured by the Western Electric Company, either in this country or in its Antwerp factory, although other European factories get a portion of this business. Probably this is the direct result of the backwardness of telephone progress and the practical monopoly which has been maintained in the operating field by the National Telephone Company.

There has been a considerable movement in Great Britain in the direction of municipal telephony. This is comparable with the Independent work in this country. The installation of municipal governments in Great Britain, have been antiquated equipments, because they were not laid out by engineers in touch with telephone progress, and manufactured by companies having no experience in large switchboard construction. This is to be deplored, as it has had the effect of preventing the expansion of the telephone business. If the people who became interested had taken the trouble to carefully study the conditions elsewhere, the results would have undoubtedly been different, and there would be many more telephones in the United Kingdom to-day.

All of the telephone systems of any importance on the continent of Europe are under government control. This is particularly true in France, Germany and Belgium. There are well organized departments, but very little attempt to satisfy the customer. The telephone is not a business but merely a means of maintaining a lot of people at the government's expense. The subscriber has no choice of service, but he must take a regular telephone at a regular price or not have any. If he has the misfortune to get into a disagreement with the operator who usually is a relative or friend of a politician, he is very liable to have his telephone removed. Telephone apparatus is kept in service as long as it is possible to use it and all improvements are considered from a theoretical point of view, rather than an economical one. In fact, the cost of operating and maintenance is very seldom considered.

When the large central energy exchange was installed in Brussels, it was feared by the government officials that they would have some difficulty in finding work for all their operators on the new switchboard. The result was that the switchboard could not be operated in the most efficient way. The Minister of Posts and Telegraph in France, when confronted with the fact that a central energy switchboard would save from 30 per cent. to 40 per cent. on the operating expenses, made the remark, "that

*Abstract of paper read before N. Y. State Ind. Tel. Assn., at Buffalo, June 24th, 1904.

Digitized by Google

it did not make any difference; when the amount required for operating expenses had been written in the bill of appropriations, that was the end of it." One can expect very little information that will have a tendency to further the advancement of the telephone industry from an operating or a business point of view, in the continent of Europe.

On the other hand some of the substantial construction work is admirable. Within the walls of Paris there are no telephone wires. A single pair lead covered cable goes to each subscriber's instrument.

The three largest telephone exchanges are located in the same building on the Rue Gutenberg, near the city hall. An underground system of over 15,000 pairs of wires was brought into the basement of this building and terminated on the same distributing frame. The cables were all 200 pair and laid loosely in a large box which ran along the side of the city sewers. At various intervals some of these cables were run into distributing rooms, were built underground and divided into smaller sizes by filled cables heads. These cables were then divided up into 7-5-3 and 1-pair cables, with pothead connections.

A very unique system of keeping the cables dry and treating them in case they should become damp from an accidental puncture, consisted of a dry air plant in the exchange basement. A pump driven by an electric motor drew air through a large series of desicators and forced it out into a system of piping. A connection from an air pipe was made with each cable through a small valve. At the opposite end of the cable in the distributing room, was a small valve. When this valve was open and the valve in the exchange turned on, dry air was forced through the cable, absorbing any moisture that might be contained therein. Lead pipes for air were run to each of the distributing rooms and arrangements were made for connecting the air to any of the small cables by means of a union coupling. This system of complete underground wiring has been practically adopted by the Post Office in London, and the cable drying system seems to be considered by most European telephone engineers as a desirable auxiliary feature to any underground plant.

The city of Brussels is wired in a decidedly American fashion; cables running from the exchange through tile conduits to terminal boxes on poles and wires being led from there to the subscribers' premises. A notable feature is that the poles are made of structural iron, handsome in appearance and will probably endure for all time.

The majority of European cities still operate with grounded line switchboards and complete overhead construction. One cannot help but admire the number of years they use a switchboard and some of their long spans of a thousand feet or more from one high pole to another, but the construction would hardly stand an American sleet storm, and the service would be unsatisfactory.

Probably the greatest reason that the telephone systems of Europe are far behind the times from an apparatus point of view, is the fact that they have not been able to see economy in throwing away old material and buying new. As a great many of the cities have entirely outgrown their switchboard capacities, they are slowly reconstructing their systems. In doing so they are getting to be very careful in their investigations of what is being done in other places, they study all of the available systems, invariably lay out their plans along the latest approved lines and buy nothing but the very best apparatus.

This is a procedure that Independent telephone companies here should be more eager to follow. The few extra dollars that it costs to buy the best is of very little importance when compared with the excellence of the service obtained therefrom and the low cost of maintenance.

While one may not see the enormous telephone growth in Great Europe are so far behind the times from an apparatus point of mode plants, from an engineering point of view, with the very best of material and outside construction, thoroughly fire-proof, substantial buildings, efficient protection apparatus and switchboards and telephones carefully designed in every detail, with a view to long life and the very best performance of their various functions. It has been customary to consider the life of a switchboard at eight or ten years. But it has very seldom happened that switchboards were replaced because the parts had actually worn out. Either it was desirable to make a change from a point of view of economy, or the capacity of the cables were too small to accommodate the number of subscribers. The parts of a switchboard such as keys and spring jacks rarely show enough wear to warrant their being thrown away. With a central energy double supervisory automatic signaling switchboard there is everything that can be imagined to lend itself to quick and economical service. With careful designing and construction and the use of the proper materials, will make multiple switchboards last twenty years, and within that time there will be few radical improvements. Inasmuch as supplying telephone service has reached the point where the returns on the investment are only fair earnings, it is necessary to secure capital by investing it in the very best of material, buildings and apparatus.

TELEPHONE CONSTRUCTION*

By W. H. Johnston.

In Telephone Construction, as in almost everything else, foresight is hindsight properly applied. The development of the business has rendered one after another of the older methods inadequate, and has pointed out the need of new schemes. Further than this, it has shown us what to expect and what to prepare for, to meet conditions which have not yet actively manifested themselves. Some time ago, the location of a central office building was not a matter of great import and the pole lines that radiated from it were built to bring in the business that presented itself from day to day. At present, the design and development of a telephone plant is of prime importance, and is as great a factor in the efficiency of the investment as economy in pay rolls and in the purchase of materials.

The introduction of the common battery or central energy system has done more to crystallize the methods of telephone plant construction and to bring about the high standards that are today so generally observed, than any other influence that had previously brought to bear. A local battery system is not a unit in any such sense as the modern common battery telephone plant, because local battery instruments are only dependent upon the central office for switching, while the common battery instrument is energized by the central office equipment, and is practically a part of the switchboard apparatus. Electrically, it makes not a particle of difference whether a given number of miles of line wire connecting two local battery instruments are local lines, or a combination of the local lines and a toll line; but in a common battery systems this point is of great moment. Formerly a switchboard and a separate pair of wires strung hap-hazard to each telephone instrument, constituted a plant, now, each part of the system must bear a particular relation to every other part; or the result will not be satisfactory. The thought and experiment involved in the development of the common battery have been handsomely rewarded by the greater economy of operation and in efficiency of service. Conduits, cables, good rubber insulation, and that much condemned though worthy art, tree trimming, were all known before the advent of common battery; but it was the common battery that made their necessity so manifest, and has developed the use so thoroughly.

While the standardization of details of construction is perhaps to be striven after rather than to be confidently expected—because invention and improvement is so much the spirit of the age—the lesson taught, is that the telephone plant is a case of electrical power transmission by minute quantities, and that the present local line resistance of a 24-volt system, with ordinary

*Abstract of paper read before N. Y. State Ind. Tel. Assn., at Buffalo, June 24th, 1904.

Digitized by Google

central office apparatus, is from 500 to 800 ohms. There is more in this idea than will perhaps at first appear, and its results are of a greater importance in larger centers of population than in small ones. The net economy of operation is a balance between pay roll expenditures and interest on the investment. Bearing the electrical limit in mind, it is obvious that the cost of line construction must be kept at a minimum in order to avoid losing the advantage afforded by a compact single central office system. On the other hand, it is easy to see that a handsome economy in plant design, may prove a very expensive arrangement when operating charges are calculated.

In the first burst of enthusiasm that heralded the new school of telephone construction, some money was wasted in unessentials that reaped no adequate return. Now, by experience the average telephone man has a pretty thoroughly defined idea of what is necessary to insure good, permanent service and how much and what quality of it is needed in each particular case. The items of development that are most noteworthy, are greatly increased use of paper insulated lead covered cable and the employment of methods of complete underground distribution.

In the days of the local battery, it was understood that lines must be kept free from grounds, but the absolute necessity of strong ship-shape work was not clearly demonstrated until the new system came into use. We care for our plant systematically now. We watch slack wires, loose corners, leaky cables and districts in which electrolysis makes its appearance as never before, we work all night to clear up a case of trouble that a few years ago would have been passed over to the next day's list; we inspect instruments, wires, poles and cables so that we may detect and remedy, if possible, incipient defects before they have the opportunity to do harm. It is gratifying to know that the telephone has become such a popular institution, and is so extensively used that methods of construction and maintenance which would have been prohibitively expensive some years ago, used in their present wholesome ways, are actual economies and result in considerably decreased costs in installation and operation.

THE INTERNATIONAL ELECTRICAL CONGRESS

AT the International Electrical Congress to be held in St. Louis from Sept. 12 to the 17th over 160 specially written papers will be read.

Efforts are being made to secure the MSS. of as many of the 160 papers at as early a date as possible, in order to have them printed in advance and distributed among the Congress members at St. Louis. Thus far six papers have been delivered, and many more are promised.

One thousand certificates of membership have been issued to those who have become members by sending in their subscription, and about 100 more certificates are about to be issued. In all over 1,700 acceptances have been received for membership in the International Electrical Congress. The programmes scheduled for Sections D and E are herewith given as being of interest to those of our readers in the engineering field:

SECTION D.

Electric Power Transmission. Chairman, Mr. Chas. F. Scott. Secretary, Dr. Louis Bell.

Name of Author. *Title of Paper.*

Sig. E. Bignami, "Electrical Transmission Plants in Switzerland."

H. M. Hobart, "Conditions Conducive to Economy in Motor Design."

Mons. Maurice Leblanc, "Transmission of Alternating Currents Over Lines Possessing Capacity."

Prof. G. Mengarini, "Utilization of Hydraulic Powers in Italy."

Prof. F. G. Baum, "High-Potential Long-Distance Transmission and Control."

F. O. Blackwell, "The Tower-System of Line Construction."

H. W. Buck, "The Use of Aluminum as an Electrical Conductor."

V. G. Converse, "High-Tension Insulators."

M. H. Gerry, Jr., "Line Construction and Insulation for High Tensions."

L. M. Hancock, "Bay Counties Transmission System."

R. L. Hayward, "Some Practical Experiences in the Operation of Many Power Houses in Parallel."

J. F. Kelly and A. C. Bunker, "Long-Distance Power Transmission."

P. M. Lincoln, "Transmission and Distribution Problems Peculiar to the Single-Phase Railway System."

R. D. Mershon, "The Maximum Distance to which Power can be Economically Transmitted."

P. N. Nunn, "Pioneer Work of the Telluride Power Company."

J. S. Peck, "The High-Tension Transformer in Long-Distance Power Transmission."

Dr. F. A. C. Perrine, "American Practice in High Tension." N. E. L. A. Paper.

Dr. C. P. Steinmetz, "Theory of Single-Phase Motors." A. I. E. E. Paper.

SECTION E.

Electric Light and Distribution. Chairman, J. W. Lieb., Jr. Secretary, Gano S. Dunn.

Prof. André Blondel, "Impregnated Arc-Light Carbons."

Herr Max Déri, "Single-Phase Motors."

Herr E. de Fodor, "Rates for Electricity Supply."

Invitations to send delegates have been sent to thirty national electrical and scientific bodies all over the world.

The following bodies have already promised to hold simultaneous conventions and joint sessions:

The American Institute of Electrical Engineers.

The American Electrochemical Society.

The American Physical Society.

The International Association of Municipal Electricians.

The American Electrotherapeutic Association.

The following bodies have promised to send delegates to the congress:

The National Electric Light Association.

The Association of Edison Illuminating Companies.

In Europe the following bodies have promised to send delegates to the congress:

The Société Internationale des Electriciens.

The Schweizerischer Elektrotechnischer Verein.

It is expected that the Institution of Electrical Engineers of Great Britain and the Elektrotechnischer Verein of Berlin will also send delegates.

All delegates of the co-operating bodies are invited to read papers before any section of the congress they select. Such papers will be printed in the Congress Transactions as being offered by the delegate on behalf of the co-operating body. The paper and discussion thereon will subsequently be offered by the congress to the co-operating body for incorporation in its own Transactions, if desired.

All communications concerning the Congress should be addressed to the general secretary, Dr. A. E. Kennelly, Harvard University, Cambridge, Mass.

TELEPHONE EXCHANGE ENGINEERING

ARTICLE XVIII.—TOLL-TIMING APPARATUS

By Ray H. Manson, Albion D. T. Libby and Charles A. Simpson.

THERE are various methods used in telephone exchanges for timing long distance conversations. Probably the most common is the ordinary clock, sometimes regulated hourly from a common station. Usually one clock is provided for all operators, located in a convenient position on the wall of the exchange room. Unless this clock is in the direct line of vision, so that a line perpendicular to the face of the dial will pass through the operator's eye she will read the time incorrectly at different positions of the hands. If several operators are using the same clock, only one can be directly in front of the dial; therefore, each will see the time differently at the same moment, the readings being both fast and slow during each half hour. The reason for this is apparent from Fig. 67, which shows two operators reading the time from one clock dial, the latter being in the reader's direct line of vision. When the minute hand is at the top of the dial, operator *A* will read the time fast and operator *C* slow, while with the minute hand at the bottom of the dial these conditions will be reversed, and *A* will read the time slow and *C* fast. If the clock is above the operator's line of vision, the time will appear fast to all of the operators when the minute hand is on the IX. part of the dial, and slow when the minute hand is on the III. part of the dial. Furthermore at all other points on the dial the error of vision is a constantly varying quantity, depending on the angle of vision.

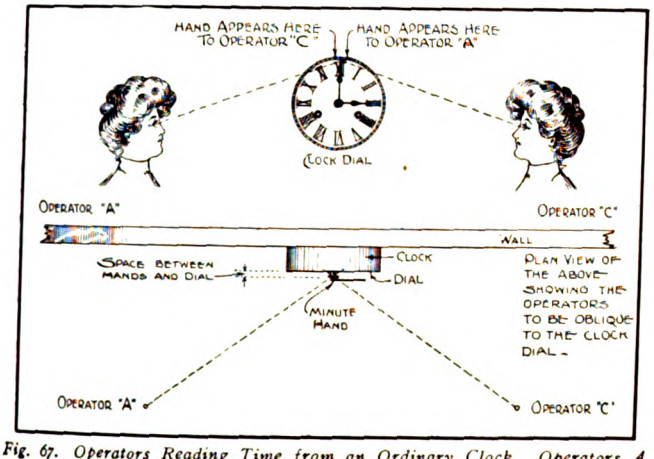

Fig. 67. Operators Reading Time from an Ordinary Clock. Operators A and C, Not Being in Direct Line, Read the Time Incorrectly.

A clock placed in the line of the switchboard sections will eliminate a part of these errors, but it is awkward for the operators to see the time. Individual clocks placed directly in front of each operator, with the center of the dial in the direct line of vision, gives the best arrangement with this method. Operators usually disregard all fractional parts of a minute, unless the clock is provided with a second hand, which is very seldom the case. Thus a chance is introduced for irregularities in timing. During rush hours it is physically impossible for the operator to read the time and record the same without personal errors, and either the patron or the telephone company will suffer. In all probability it will be the latter, as the operator soon learns from experience that it is easier for her to be on the safe side and under-estimate the time, than bother with complaints from patrons.

Time Stamps: Personal errors, due to both vision and memory, are obviated by the use of time stamps. The simpler forms are not adapted for toll service on account of their mechanical defects, and unless they are especially designed to meet the exacting requirements will prove a great injury to the service. Practically all of the commercial forms of time stamps are designed for other purposes and are operated by striking a blow of considerable force so as to obtain a clear impression. It is easy to see that the noise and jar caused by operating several of these stamps on a toll switchboard would greatly interfere with its operation. If, however, the stamps are each mounted on a solid pedestal, attached to the floor, so as to be in no way connected to the switchboard, this trouble is reduced.

A common form of time stamp has the figures of the printing

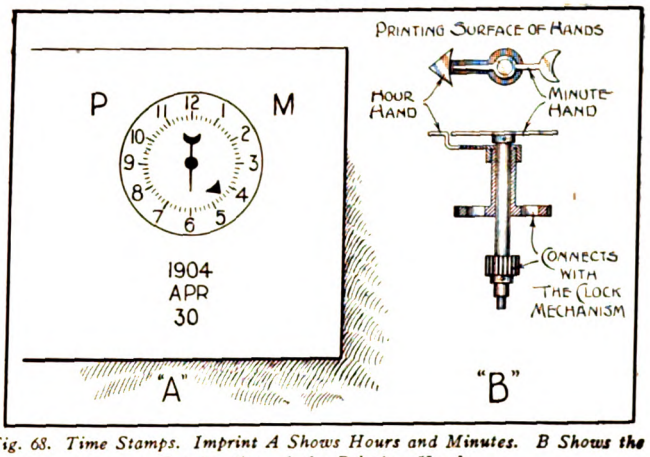

Fig. 68. Time Stamps. Imprint A Shows Hours and Minutes. B Shows the Construction of the Printing Hands.

dial arranged in a circle, similar to those in a watch dial, the pointers which indicate the hour and minute rotating in the center as shown at *A*, Fig. 68. In order that the dial and pointers may be printed at the same time, their tops or printing surfaces are in the same plane. This requires a special construction of the hands, shown at *B*, Fig. 68, so that they may pass each other without interfering. This brings the hour hand just within the circle of figures, and as only its end can print, it is made clearly visible by being formed in the shape of a large triangle. The minute pointer revolves twelve times to one revolution of the hour pointer, as in an ordinary clock, and for mechanical reasons it is made short, so that its point may pass the heel of the hour pointer. This brings the point of the minute indicator quite a distance from the minute divisions on the number circle, and makes the reading of the exact time difficult. The back-lash or play between the teeth of the clock gear wheels will allow the pointers to jump back or

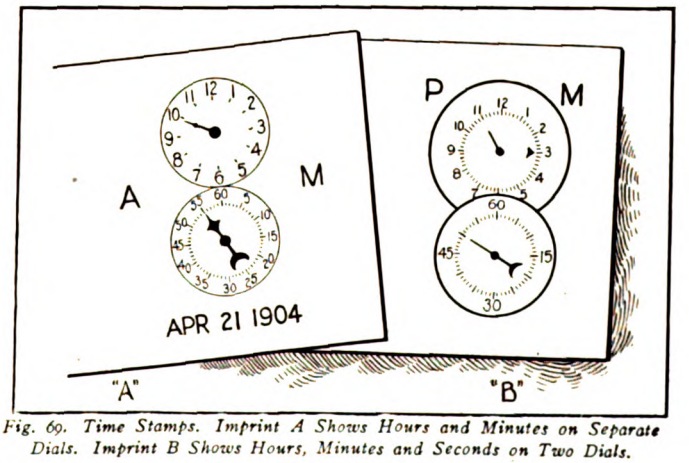

Fig. 69. Time Stamps. Imprint A Shows Hours and Minutes on Separate Dials. Imprint B Shows Hours, Minutes and Seconds on Two Dials.

forward when printing unless the mechanism is especially made. The errors due to these causes may be much more than one minute from the correct time, making this type of stamp useless for measuring small periods of time. Similar stamps are made with separate hour and minute dials and hands giving an imprint

Digitized by Google

like *A*, Fig. 69. In this case it is not necessary for the minute hand to clear the hour pointer, and thus can be brought out close to the number circle, making the record easily read.

The imprint at *B*, Fig. 69, is from another type of double dial stamp, made for printing seconds in connection with a regular hour and minute dial. The hours and seconds are easily read, but the use of the short minute pointer, as previously described, makes this part of the imprint liable to error. Errors due to the great distance between the minute pointer and the minute divisions are done away with by a type of stamp using a revolving minute dial and a stationary pointer. Imprint *A*, Fig. 70, is from an instrument of this type, with a revolving dial divided into minutes, while *B* is from another stamp with the dials divided into minutes and quarter minutes. The latter has two revolving dials of large diameter, and for this reason only a small portion of them are printed. The legibility of the imprint, together with the ability to print fractional parts of the minutes, makes it especially suitable for toll timing.

A step-by-step time stamp with figures to indicate hours and minutes gives the most easily read impression of any time stamp record. In order that the figures may show in alignment at all times, the printing wheels are jumped forward at the end of each minute, giving an impression similar to *C*, Fig. 70. Fractional

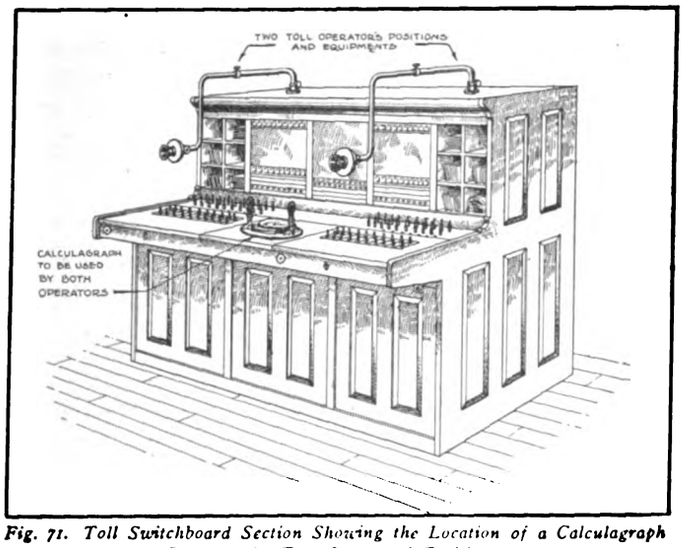

Fig. 71. Toll Switchboard Section Showing the Location of a Calculagraph Between the Two Operators' Positions.

parts of a minute cannot be recorded by this type of stamp, making it possible to show an error of 59 seconds, which for toll timing would be out of the question. Many other types of time printing stamps are made, but with all of them it is necessary to make a record at the commencement of the conversation, and subtract the two records in order to arrive at the elapsed time. This consumes valuable time, and there is still a possibility for personal error, but not to such a great extent as in the clock method of toll timing.

STOP WATCHES: Probably the first means of measuring elapsed time direct, without calculation, which would present itself to those uninitiated into the mysteries of toll timing, is the regular stop-watch. As only one message can be timed by the stop-watch at one time, it is obvious that several watches must be used by each operator, at least one for each toll line, so that there will be no interference if all of the circuits were busy—a not uncommon case, even at unimportant stations. The keeping track of so many timepieces, their proper manipulation and the recording of the results on toll tickets, makes the use of stop-watches a burden rather than an assistance.

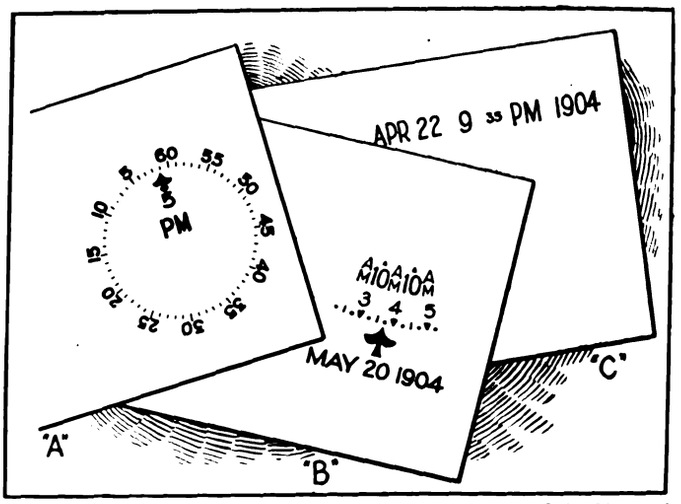

Fig. 70. Time Stamps. Imprint A Shows Hours and Minutes by Means of Movable Dials. Imprint B Shows Hours, Minutes and Quarter Minutes by Means of Movable Dials.

CALCULAGRAPH: There is an instrument made especially for timing toll messages which prints the elapsed time direct without any mental effort on the part of the operator, other than to stamp the ticket at the commencement and finish of the conversation. This instrument is known as the calculagraph. In its operation it mechanically subtracts the time of connection from the time of disconnection and prints the actual number of minutes and quarter minutes that elapse during the interval. As a single calculagraph will make such records for a large volume of business, without reference to the consecutive order in which they are taken, it is customary to place the instrument so as to be available for the use of two operators. In fact, the modern two-position toll sections are now made similar to that shown in Fig. 71, with a space in the center of the key shelf, between the two operators, for a calculagraph or other timing device.

A calculagraph record printed on a standard toll ticket is shown in Fig. 72. The imprint on the right hand side of the vertical dividing line is the time the parties were connected for talking, or the time of day. The triangular shaped pointer, indicating the hour, revolves around outside the circle of figures, while the minute pointer is in the center, so that its point is adjacent to the minute divisions. This gives a somewhat clearer imprint than the one shown at *A*, Fig. 68. There are two elapsed time dials, the one at the left hand side having a total of five minutes divided into quarter minute periods, the other a total of one hour divided into periods of five minutes each. The pointer on the latter dial passes from one space to the next during the time of an entire revolution by the left hand pointer. Thus the even periods of five minutes each are read on the middle dial, and fractional parts of such periods, down to quarter minutes, are read on the left hand dial.

Digitized by Google

The printing mechanism of the center dial of the calculagraph is shown in Fig. 73. A pointer die, *a*, is permanently mounted at the top of a shaft, *b*, so as to revolve with the clock mechanism. This shaft can be forced upward by a forward movement of the handle, *L*, and will then print an impression of the arrow-shaped pointer on a card, if inserted between the inking ribbon and

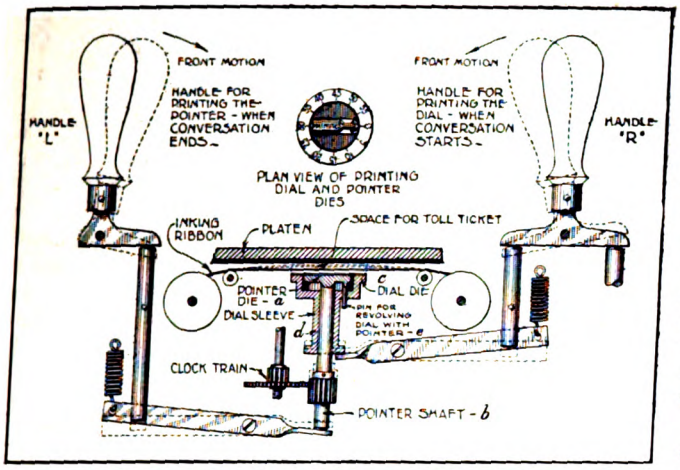

Fig. 73. Calculagraph Mechanism, Showing One Elapsed Time Dial and Pointer.

platen, as shown at *e*, Fig. 74. A dial die, *c*, with a sleeve-shaped stem, *d*, is mounted on the pointer shaft, *b*, so as to revolve with it. This stem can be forced upward, without lifting the pointer shaft, by a forward movement of the handle, *R*, and will make an imprint same as shown at *C*, Fig. 74. The dial and pointer are made to revolve together by a connecting pin, *e*, thus causing the arrow to always point to the zero mark on the dial. Either the dial die or pointer die can be forced upward so as to print without causing the other to lift and make an impression.

If both levers, *R* and *L*, were pulled forward at the same moment, the resulting impression on a ticket, placed in the printing slot, will show the arrow pointing to the zero mark on the dial. But in practice the records are not made in this manner. The dial is printed at the commencing of a conversation, and the arrow at the finish. During the interval both have moved forward and the arrow when printed will point toward figures on the ticket, which express the length of the interval—the elapsed time. The other dials and pointers are similar in construction and operation.

The method of operating the calculagraph is shown in Fig. 75.

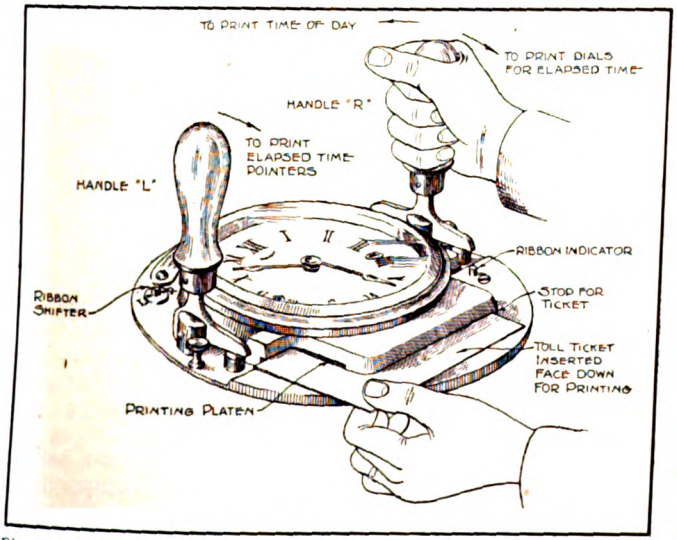

Fig. 75. Operating the Calculagraph. A Toll Ticket is Inserted for Receiving the First Imprint.

At the beginning of a toll conversation a ticket is inserted face down in the slot at the front of the instrument, with the top edge and the end of the ticket against the guide and stop. The right hand lever, *R*, is then pushed backward, and immediately pulled forward, the motion in both directions being to the limit of the movement. The backward movement of the handle gives an impression upon the right hand of the ticket, like *a*, Fig. 74, which will show the time of day the talk commenced. The forward movement of the handle gives an impression on the left of the ticket of two circles of figures, as shown at *b* and *c*. (The records shown in Fig. 74 are separated and made on different cards so as to clearly illustrate each movement of the levers.) As soon as the first imprints are made the ticket is removed from the slot so that records of other toll conversations may be started on other tickets in like manner. When any of the talking parties have finished, the card for that conversation is immediately inserted in the ticket slot, in the same manner and position as before, and the left hand lever, *L*, Fig. 75, pulled forward. This will imprint on the card two arrow-shaped pointers, same as those shown at *d* and *e*, Fig. 74. In the present case, however, they will appear in the center of the two circles of figures, which were previously printed at the commencement of the conversation, and will point toward the figures and division marks on the ticket which represent the number of minutes and quarter minutes of time which has elapsed during the conversation. See Fig. 72.

The calculagraph performs its work with practically no noise or jar and thus does not interfere with the operating of the switchboard. This is made possible by the method of connecting the printing mechanism to the time-keeping part of the instrument, which allows the printing to be done by a steady movement

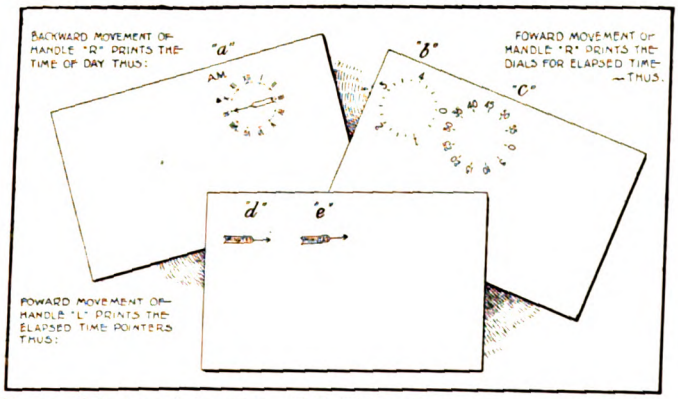

Fig. 74. Calculagraph Imprints. Each Ticket Shows a Separate Movement of the Handles.

of the handle instead of a violent stroke as on the ordinary form of printing stamp. If these two parts were rigidly fastened together the clock would be retarded each time an imprint was made by the contact of the dial and hands against the printing ribbon. In the calculagraph a certain amount of free movement is allowed between these parts so that the clock continues undisturbed while printing, and the dials and pointers are restored to normal by retaining springs, when the handle is released.

The question of the length of initial period to allow for conversations before commencing to charge overtime, and the details regarding the handling of the toll business, are topics which depend on the condition and environment of the telephone company. It is enough to say that it is only right to the user of the long distance service that his conversations are timed accurately and recorded without error so that no dispute can arise, or even doubt in his mind that he has been unjustly overtimed.

HUNTINGTON ENTERS INDEPENDENT FIELD.

IT is learned upon good authority that H. E. Huntington, who has within the past few days resigned as vice-president of the Southern Pacific Railroad, will hereafter devote himself to developing the Independent telephone system which he has recently organized in the Southwest. The new organization involves several million dollars, which it is understood has been subscribed in New York City. Already Huntington interests have secured control of many of the most important independent local exchanges in Texas, Louisiana, Arkansas, Indian Territory and Oklahoma.

BEWARE OF INTERNAL DISSENSIONS.

THE most critical period in the history of the United States of America was not when the Declaration of Independence was promulgated one hundred and twenty-eight years ago. The real test came after this independence had been established and recognized by Great Britain. The real danger came from dissensions within, immediately after the treaty of peace, rather than from foes without. So it is with the independence of telephony. Now is the critical period; now, when independence has been won by dint of hard strife; when Independent telephony seems to have been established beyond all question, and beyond even the dreams of the first hardy spirits who ventured into this field of endeavor in opposition to a great and powerful monopoly.

What, then, is the real danger which confronts Independent telephony to-day, now that victory has been won? THE AMERICAN TELEPHONE JOURNAL wishes to emphasize the fact that this danger is not altogether from foes without, but from internal dissensions and misunderstanding. If the Independent telephone business is going to continue a success and to endure, those engaged actively in it, particularly those who are operating large systems and exchanges, must respect the territorial rights of others. There must be no clashing of Independent interests in any given territory.

In this connection the action of the New York State Independent Telephone Association, at its meeting in Buffalo, June 24, is prophetic of great things. This action took the form of the following resolution:

"Be it resolved, that it is the sense of the New York State Independent Telephone Association that the territorial rights of any and all accredited Independent telephone companies, toll lines or exchanges, shall be scrupulously respected, and that no Independent telephone company shall encroach upon the territorial rights of any Independent telephone company operating an *efficient and comprehensive* telephone service."

This is not sentiment; it is business, and must appeal to business men everywhere. The fundamental basis for the security and progress of the Independent telephone business, for the future, lies absolutely in the strict enforcement of this resolution, just adopted by the New York State Independent Telephone Association.

So far, there have been but few attempts made on the part of Independent companies to encroach upon territory properly occupied by other real Independent companies. There was little danger of this during the years of revolution. But now that the period of experiment has passed and it has been demonstrated over and over again that a properly conducted Independent telephone company is a financial success, is the time to guard against the dangers from within our ranks. Let us beware of encroachments and dissensions. While THE AMERICAN TELEPHONE JOURNAL believes that Independent telephone men will handle the situation just as carefully as did our forefathers during the period immediately following the American Revolution, still it behooves us all to be up and doing. We cannot sit down idly, shut our eyes and trust to luck to carry us safely through these difficulties.

As the business grows and as the financial success of the different organizations is advertised, there will spring up a feeling in men, possibly not yet interested in the Independent field, that there are opportunities for them in this business. They will feel that they have a perfect right and liberty to go into any attractive telephone field and begin the development of a telephone business, without regard to the fact that such fields have been occupied and developed for some length of time by another Independent telephone company.

SOME FACTS TO BE CONSIDERED.

In one sense they will have this right. They cannot be expected to look at this matter in the same light as does the operator who has fought for this supremacy. Time spent in condemning such investors is time wasted. The business of existing Independent companies is to see that these things do not take place; that a field already properly covered is not invaded by another competing Independent company. If this can be done, all will be well with the Independent telephone business. But the moment a precedent is established by one company competing in the Independent field with another Independent company, particularly if this precedent is established by a strong Independent organization, just then the Independent telephone business will be face to face with the most serious crisis in its history.

The truth of this requires no demonstration. It is axiomatic. Independent companies will have their hands sufficiently occupied in competing successfully with the Bell companies, all of whose allied interests are controlled by one central organization with the perfection of harmony.

Unless the Independent telephone companies now in existence can agree among themselves that they will not connect with, or do business in any manner, with any telephone company that infringes on the territorial rights of any other Independent company, whether it be toll line or exchange, then there can be absolutely no assurance to the present companies that their territorial rights, which they have striven so hard to develop and protect, will be regarded, and that they will retain the possession of the territory which they are properly taking care of.

Without this assurance Independent telephony cannot endure. Just as after the critical period following the Revolution the colonies got together on a basis which regarded the rights of all, so Independent companies must get together, not as one great centralized corporation, but with an absolute understanding which shall guarantee the rights of each. The New York Association has taken the proper course and one which will go far toward solving the problem. For the Independent companies themselves possess the remedy; it is only necessary to apply it. Each telephone company and each State association should adopt similar resolutions as this one adopted in New York. Each should regard the territory occupied by an active and *real* Independent telephone company as sacred to that company's uses as if it had acquired that territory by real estate purchase. Then the present companies can go before their stockholders and give them every assurance that the territory they are now developing and the business they are now securing will be theirs absolutely, so far as other Independent companies are concerned, just as long as they properly take care of it.

THE AMERICAN TELEPHONE JOURNAL uses the words "*real* Independent telephone company" in the above sentence. It does so advisedly. It is aware that there are a few alleged "Independent" companies promoted by the Bell interests that have sought to harass *real* Independents along the lines of this editorial. The Federal Telephone Company of Pennsylvania might be mentioned. There are a few others throughout the country, but they have no strength whatsoever, and their schemes are patent to the public. This paper rejoices when such concerns suffer at the hands of Independent companies. We mean only Independent companies in the broadest sense of the word.

Here, then, is the test. Independent telephony has fought a great fight with monopoly and has won the victory. Now is the critical period. Let existing companies rise to the occasion, that their hard-won victory may be permanent.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

DAMAGES FOR INTERFERENCE BY CONDUCTION.

A telephone company has been successfully operating grounded farmers' telephone lines for a period of five years. An interurban electric railway is constructed, which renders the successful operation of these lines impossible, and necessitates the reconstructing of them at considerable expense. Is the railway company liable to the telephone company for damages?

L. C. Telephone Co.

YOU do not state in what way the electric railway interferes with the operation of your telephone company, so that I will assume, for the purpose of answering your question, that the interference was by conduction. The rule in such cases is that for injuries caused by conduction, due to more powerful currents used by an electric railway company, there can be no recovery by another electrical company, whose wires are grounded upon the highways. And, though its wires may be grounded upon private property, yet if directly connected with its use of the public highway, and a part of its system in such use, there can be no recovery from the railway company. A different rule, however, is said to prevail in case the telephone company has constructed its lines upon private property, and the highway was not affected by the operation of its system. In such a case, if the lines were so affected by conduction as to prevent their operation or the successful transaction of the business of the company, there would probably be held to be such an appropriation of private property as would require compensation to be made. Joyce on Electric Law, Section 510.

TWO COMPANIES ON SAME SIDE OF STREET.

A TELEPHONE company cannot assert an exclusive franchise to occupy the streets of a city with its poles and wires, as against another telephone company obtaining the same right from the city authorities. This was the ruling of the Supreme Court of Alabama in the case of the American Telephone & Telegraph Company against the Morgan County Telephone Company, in which the former company sought an injunction against the latter company, to restrain it from the erection of its telephone line and the operation of its telephone system.

The facts of the case were that the complainant company has a franchise from the town of New Decatur, Ala., in pursuance of which it constructed its line along the highways of the town and operated its telephone system therein. The construction was performed under the supervision of the street committee of the town. Later the defendant obtained a similar franchise and began, without the consent of the complainant, to construct its lines along the same side of the streets in said city that complainant's poles occupied, digging holes for its poles between the poles of complainant. . The answer of the defendant to the bill of complaint showed that its poles were of sufficient height to enable defendant to string its wires so as not to interfere by contact with complaininat's or act as conductors of electricity from them. Defendant's poles were set in the ground six feet and braced as well as possible. Any contact with complainant's wires during the process of erection would be of a temporary character. It appeared that scientific appliances for insulation would be provided, which would prevent defendant's wires from acting as conductors of electricity from those of complainant, except possibly from accidents from winds or storms.

The contention on the part of the complainant was that without its consent the defendant had no right to erect its poles on the same side of the street with it between the poles of the complainant and to string its wires on or near the tops of these poles above the wires of complainant; while that of the defendant was, conceding the equal right to the complainant with itself to the use of the streets of the city for its telephone purposes, that complainant had no right to said streets superior to the right of the defendant so long as defendant did not in some serious and permanently injurious manner interfere with the complainant's rights.

The court held that the rights of each company were equal, the principle being well settled that no company can, under ordinary circumstances, assert a right to the exclusive enjoyment of a city's streets. The two companies were regarded by the court as in the legal attitude of using, in a sense, their own property, the obligation of each being to so use its own property as to do no unnecessary injury to that of another; and for any default in that particular, the negligent party being liable to the other in an action for damages. The court accordingly held that the complainant had not presented such a case of pressing necessity as authorized intereference by injunction.

Much of the defendant's answer set up facts tending to show that the purpose of complainant was to maintain a monopoly of telephoning in the city and to exclude defendant therefrom. These matters the court considered as not directly responsive to the averments of the bill, when considered as one for present injunctive relief. American Telephone & Telegraph Co. v. Morgan County Telephone Co., (Ala.) 36 S. 178.

PUNITIVE DAMAGES FOR TRESPASS.

"IF trespass upon the plaintiff's land by the telephone company was done in a high-handed, malicious, and oppressive manner, he can recover punitive or exemplary damages." So ruled the Supreme Court of Kentucky in a recent case. The petition alleged a trespass by digging holes and erecting telephone poles on defendant's land, the wrongs being done over plaintiff's protest, and being forcibly and maliciously committed. The answer failed to deny the ownership and possession, or the digging of the holes, or the erection of the poles, but merely denied that the trespass had been committed in an aggravated manner. The evidence showed the commission of the alleged trespass, by defendant's servants, who entered on plaintiff's land without pretending to know to whom it belonged, and committed the acts in plaintiff's presence, and despite his protest. The court held that the plaintiff was entitled to a peremptory instruction for the actual damage done to his property. Jones vs. Cumberland Tel. & Teleg. Co. (Ky.), 80 S. W., 165.

SERVED HIM RIGHT.

F. M. MOSSMAN, of Whitely County, Ind., is defendant in a very peculiar case. He protested against the erection of a telephone line in front of his home. He began by ordering the men who came to dig the post holes to leave the place. They dug the holes and he as quickly filled them in. The next gang of men succeeded in erecting the poles; these he pulled up and carried into his barnyard. They were replaced, and he next sawed them down; then he took an ax and cut the wires into short bits and split the poles. The president of the Whitely Telephone Company called upon him and told him that if he would refrain from molesting their property no prosecution would follow. Mossman declared: "As long as God gives me strength I will cut down the poles as fast as they are erected." He was arrested, fined $5 and costs, and given thirty days in jail, from which decision he took an appeal.

THE DEADHEAD IN THE TELEPHONE SERVICE*

By H. D. Stroud.

THE idea would be characterized as absurd if it were proposed for a railroad company to issue a ticket, for a stipulated sum per annum, which would give to the holder the privilege of unlimited travel, the ticket being transferable so that it could be always in use. This policy, if carried out to its ultimate end, would result in crowded trains and more of them; more tracks would be necessary to handle the traffic. The people who really needed to travel and who paid for the privilege of so doing would often be crowded out, or at least inconvenienced, by the multitude of *railroad deadheads* who were traveling simply because it cost them nothing and they had nothing better to do. From the standpoint of the railroad companies it would be no less disastrous because they would be required to give unlimited service for a fixed charge.

Absurd as this idea seems it is exactly what the telephone companies of the present day are doing, in the great majority of cases. For a certain fixed charge per annum they grant the privilege of a telephone line not only to the person who pays the bill, but to anyone who wishes to avail himself of free service. The result in the case of the telephone company is worse in some respect than in the case of the railroad cited. A crowded railway train is always susceptible to a little more crowding; people hang on to the straps and out of the windows, and, if necessary, get on the roofs of the cars. When, however, a telephone line is in use for no matter what purpose, all others than the user at that moment are compelled to wait.

The matter is susceptible of analysis. Actual figures show that the number of calls made per day in the average city is such as to indicate that 50 per cent. of the population find occasion to make a telephone call at least once a day. As against this it may be stated that the proportion of telephones in service to the population, in the average city or town, is about one telephone to 40 people. This high percentage of users as compared to the telephones in service indicates that a large percentage of the calls are made by people other than those who subscribe to the telephone service; that is, by people who pay the telephone company no revenue at all.

This great army of unprofitable—or, more properly, *profit-reducing*—telephone users is composed of people in almost every station of life. The lady of leisure who asks her druggist or grocer to send a message to her husband down town; the young lady stenographer who calls her "friend" during office hours and holds the wire for half an hour, keeping her employer's line busy, and possibly incurring a greater loss to him than if he had given her a half day off to attend to her social affairs; and the party next door who uses the telephone as much as the person who pays the bill. These are but a few of that class of humanity known as the *telephone deadhead.*

The telephone subscriber under the flat-rate plan is, under ordinary conditions, the victim of gross injustice. He pays for the service of the telephone line, of which he is supposed to have exclusive use. If he is a business man he finds that his telephone is kept unnecessarily busy on trivial matters, either by the use of the telephone for other than his own business, perhaps by outsiders who *may be* civil enough to ask it as a favor. He not only finds that he cannot use the line when he wants to, but, what is worse, that his customers or clients are not able to reach him without undue trouble, and that business which might come to him may be forced elsewhere.

The telephone is a doorway through which more business may enter than comes in through the door left by the architect. It is as unprofitable to block this telephonic doorway with needless outgoing traffic as it would be to block up the architectural door with outgoing shipments in such manner as to prevent customers from entering.

The deleterious effects of the deadhead are not so directly traceable with respect to incoming traffic, but are nevertheless present. A line is *just as busy* when rendered so by *incoming* traffic as by *outgoing.* And it is within the power of people on the outside, with nothing else to do, to keep a man's line busy on trivial and therefore unprofitable affairs. Telephones will be used for making such calls unless some method can be put into effect for preventing the trivial and indiscriminate use of the telephone.

Such a method applied to any one telephone would prevent in large measure such annoyances due to outgoing traffic on that particular line; but this telephone is subject to incoming calls from any other telephone and therefore in order to attain a complete remedy for these evils the method adopted for its relief must be generally applied—applied to many telephones instead of to one only.

In large cities the deadhead call has become such a nuisance that it is used as a serious argument by the proprietors of many stores and offices against installing telephones at all. This is always the case in railway depots and public places where unlimited service is used, while in small towns where people are more familiar with their neighbors than in large cities it is even more of a nuisance in this respect.

On party lines the various objections to flat-rate service are present to an even greater extent. Owing to the trivial and needless use of the line by parties at other stations a subscriber is often compelled to wait hours for the transaction of some really important business.

If the present method of charging is objectionable from the standpoint of the subscriber it comes near being a positive calamity to the operating company. The rates that were established a few years ago on a scale calculated to give the operating company a reasonable profit are becoming too low. This is due not only to the fact that the number of subscribers is increasing and therefore the cost for giving service to the subscriber is increasing, but also to the fact that the traffic has increased enormously on account of the various reasons already mentioned.

The cost of giving telephone service, other things being equal, depends on the traffic. As a rule, the operating companies are not able to raise their flat rate charges, due either to the sentiment of the public or to the fact that in many cases the actual franchises, under which the telephone companies gained existence and operate, limit the rate charged for unlimited service to that in actual effect.

How does the amount of traffic influence the cost of giving service? First, increased traffic means that a smaller number of lines on an average may be handled by an operator and therefore more operators are required; more operators means a larger pay roll. Second, the fact that a greater number of operators are required means a greater number of positions at the switchboard; it means that the jacks must be multiplied through a greater number of sections than would otherwise be the case. The cost of the switchboard is therefore made greater and this means that there is a larger item for interest and depreciation with increased traffic. Third, a greater number of sections required on the switchboard makes necessary more floor space, which means more rent, or its equivalent—more interest on the investment in the building, where the building is owned. Fourth, the greater number of switchboard sections and the increased number of wires means more light, more current for operators' transmitters, and therefore greater miscellaneous expenses. Lastly, apparatus that is much used will wear out more rapidly than that which is less used, therefore with increased traffic not only is depreciation greater but the cost of maintenance is higher.

What is the remedy? Is it not to be found in general along the line of increased rates. The public, as a rule, will not stand with good grace for a rise in rates and even if this were not the case the franchise is often of such a nature as to prohibit it. Obviously,

*Extract from a pamphlet issued by the Controller Company of America.

Digitized by Google

therefore, if the rates cannot be raised and the exchange is being managed as economically as possible for the amount of traffic being handled, the only remedy is to reduce the traffic and the only way to reduce the traffic is to cut out the deadhead, and thereby the unwarranted and wasteful use of service.

From the above an unalterable conclusion may be reached that in any form of public service the flat rate of charge for unlimited service is abnormal, inequitable and unjust, proving a burden alike to the operating company and to that portion of the general public which pays the bills.

The stock argument of those telephone companies using unlimited service is that they are in the telephone business to give their patrons all the service they want for the price they fix. It is reasonable to say that this policy cannot long continue. This is true, if for no other reason, because it is not in accord with good business principles. It might prove profitable to the telephone company if a sufficiently high rate could be secured from a few subscribers to pay for the entire operation and maintenance of the exchange as was the old-time Bell policy. What subscriber, however, wishes to pay for the deadhead business when he learns that there is a reasonable way to make everyone pay his proper share for the telephone service received? Deadhead calls are unprofitable both to the operating company and to the telephone subscribers. The deadhead borrows telephone service, so to speak, but he borrows that which he has no means of paying back. The cost of operating and of maintenance and the expense necessary to supply switchboards, cables and wires is greater per telephone where the service is used indiscriminately; the percentage of unsuccessful calls, due to the line called for being busy, is in direct proportion to the traffic, and the telephones and parts of the switchboard have a life in proportion to the traffic as well.

Any plan which will result in a material increase of the revenue from subscribers and at the same time a material reduction in the cost of operating as well as of interest, depreciation and rent is worthy of serious consideration.

We have seen electric light sold on the unlimited flat rate plan in the early days of electric lighting business, but now, even in small towns the electric light and gas companies have made large outlays of capital in the introduction of meters and like appliances so as to measure the service rendered and make the charge accordingly. As a result, these companies have found that they can supply more customers on this basis with a given outlay of capital, or, in other words, without increasing the size of their generating plant they can serve more customers, giving each as much light as he chooses to pay for and preventing the waste of light which is sure to occur when the user's pocketbook is not affected thereby. In the electric light business, therefore, the force of the whole matter is that measured service prevents waste. No sensible person will deny these facts.

As in the electric light business so in the gas business, the railroad business in general and all other forms of public-serving enterprises, excepting the telephone business, some means of compelling the user to pay for what he gets has been adopted in order to prevent the waste which would otherwise have proved the ruin of the operating companies. It seems strange, therefore, but it is nevertheless true, that the telephone business, in which the waste of service is not only ruinous to the companies but detrimental to the interests of the customers, should be the last to succumb to this rational plan of working. That it is a rational plan and that the telephone people throughout the world are coming to it rapidly no sensible person who is a student of conditions can doubt.

The way then to down the deadhead imp is to measure the amount of telephone service as a basis of the charge for such service. That this is true is proved not only by the arguments advanced above but also from actual facts gathered from conditions existing in those cities whch have adopted measured service in large degree.

A good example is found in one large telephone system using something over 50,000 nickel pay stations. In this there is given, besides individual line service, two-party line selective service, four-party line selective service, and ten-party line non-selective service. In this system the ten-party line traffic is but little heavier than that of the average individual line in the same district on the flat rate plan. This is because a nickel must be paid at the time the telephone is used. The average income on the ten-party line service is about $3.50 per telephone per month. In public places, such as drug stores, depots, hotel lobbies, etc., a special size of cash box holding $32 in nickels became necessary and some of these require collection twice a week because the capacity of the box is not sufficient to hold the week's deposit. It is not unusual in a city to find telephones averaging $5 per day. These figures are facts, not fancies. So much for the possibilities of measured service.

Probably the ideal telephone system is one where a charge is made for the installation of the telephone, and then a given charge per call, and, where it seems advisable, a small guaranteed use of the service on the part of the subscriber may be required, varying from one to five nickels per day, according to the parties on the line. Party-line service on this plan is free from the objections offered to it on the free-for-all way of selling service for the very reason that measured service lightens the traffic. Looking at this from the standpoint of the operating company more parties may be placed on the same line without overloading the line. From the standpoint of the subscriber, the number of parties on a line being the same, the traffic is so greatly reduced that he is seldom aware that other parties share the use of his line.

Under the measured service plan the deadhead becomes a live one, the unwarranted and frivolous use of the service is obviated, the small merchant or the man of small business affairs may have telephone service within the reach of his purse and just as adaptable to his needs as is unlimited service to the man who is able to pay for it.

The telephone deadhead is the greatest enemy of good telephone service. Like a leech he is slowly but surely sapping the strength of what would otherwise be strong, energetic organizations. The deadhead is the sworn enemy of the dividend.

THE TELEPHONE SITUATION IN MANILA.

SEVERAL attempts have been made to secure a franchise for an American company to operate a telephone system in Manila, but so far without avail. There are several reasons which tend to prevent the spending of any large amount of money to better the execrable service that is given by the present company. In the first place, the cost of installation is very high; and American or good Spanish operators would require high wages to enable them to live and work respectably. So far the Government has not made any concessions that would allow a reputable company to engage in business.

Under a practically exclusive franchise from the Spanish Government, which must be respected, the present company can retain its privileges eight years longer, the only condition being that a "satisfactory and proper service be maintained during that time." It is easy to conjecture that this satisfactory and proper service will not be an improvement over the telephone conditions that exist at the present. The apparatus in use is antiquated, consisting of the earliest types of Ericsson and Spanish inventions.

The district covered by the present exchange is called the "red telephonica," or telephone network, and is maintained by native and half breed employees. An instance of the service that is given is herewith described, which may be of interest. An American gentleman wished to call up a party on an important business matter, demanding immediate attention. For fully half an hour he rang steadily, until some friends happened to come in. Asking one of the gentlemen to keep up a steady ringing, he jumped into his carriage and drove over to the exchange. In less than ten minutes his voice came over the wire, and in language not exactly parliamentary he told of finding the operator lying back in his chair reading a paper and smoking, with his feet on the table, one bare toe keeping the drop of the line up, while he used the other foot to replace any other drops that might fall. During the night the operators have the habit of grounding or opening a line that is at all likely to be busy; in fact, during the night hours the wires of the *Cablenews* and *American*, Manila's two principal daily newspapers, are frequently cut off for hours at a time.

IN THE OPERATING FIELD.

TELEPHONE PAPERS TO BE READ AT ST. LOUIS.

WE are informed that at the International Electrical Congress to be held at St. Louis the following papers in Section G will be read:

Electric Communication. Chairman, Mr. F. W. Jones; Secretary, Mr. B. Gherardi.

"Electric Communication in Spain," Señor Don Julio Cevera Baviera.

"A New Danger to Lead-Covered Aerial Telephone Cables," John Hesketh.

"Simultaneous Telephony and Telegraphy," Herr Joseph Hollos.

"Telephony and Telegraphy in Japan," Saitaro Ci.

"Questions Connected with Rates and Management in a Telephone Exchange," G. de la Touanne.

"Telephony," Hammond V. Hayes.

"The Telephone Problem in Large Cities," Franz J. Dommerque.

"Features of Two-Strand Common Battery Systems," J. C. Kelsey.

"Problem. Automatic vs. Manual Telephone Exchange," Kempster B. Miller.

"Telephony," F. A. Pickernell.

"Military Use of the Telephone, Telegraph and Cable," Col. Samuel Reber.

"Electrolysis of Underground Conductors," Prof. George F. Sever.

"Economical Features in Modern Telephone Engineering," L. W. Stanton.

Up to June 23 1,776 applications to the Congress had been received and over 150 papers promised. Twelve of these papers have already been delivered. Arrangements are now being completed for printing papers in advance of the Congress, so that all that are received in sufficient time will be ready for circulation among the Congress members at St. Louis. Effors are being made to secure as many of the promised papers as possible in advance.

A PROGRESSIVE INDIANA COMPANY.

THE Richmond (Ind.) Home Telephone Company can boast of a larger proportion of subscribers than any other company in the United States with but two or three exceptions, having one telephone to every ten inhabitants. In round figures Richmond has a population of 20,000, and the Home Company has over 2,000 subscribers. This success is due to the business ability of the promoters and management as well as to the courteous treatment given to the public by its officers. The company has recently inaugurated an information service for the U. S. weather reports. Between 7 and 8 P. M. every evening all lines will be given the general signal, which consist of six short rings, and then the weather report for the next twenty-four hours will be read.

THE TELEPHONE SITUATION AT PANAMA.

THE telephone system in Panama is operated and owned by Ernesto Lefevre, under a concession that has still four years to run. The population of the town is in the neighborhood of 18,000, of these 60 per cent. are too poor to afford a telephone. At present there are about 75 subscribers, the rates being $4 silver, per month (exchange at rate of 110 per cent. for sterling). Colon, the town on the other side of the Isthmus, has a population of about 4,000. Communication, by means of the telephone between the two cities, is controlled by the railroad company. The average cost of telephone poles is about $10 silver, and the duty on telephone material 20 per cent. *ad valorem*.

SUCCESS OF THE CUYAHOGA PROFIT SHARING SCHEME.

IT is doubtful whether any other plan has ever been so successful in securing the co-operation of employees in the very best way as has the profit sharing scheme instituted by President Dickson, of the Cuyahoga Company, in Cleveland. To further promote the interests of the employees as well as those of the company, attractive mottoes have been painted upon the walls of the operating room. On one wall is a motto which reads: "This business is our business." On the next wall is the motto: "We all share in the profits." And on the third wall is this inscription: "Good service means good profits." Colonel Dickson is very much pleased so far with the results of this profit sharing scheme, and has a very loyal band of employees.

A POPULAR CHIEF OPERATOR.

IN a prize contest originated by the Louisville (Kentucky) *Times*, the chief operator, Miss Marie Yonkers, of the Louisville Home Telephone Company, is third on the list of the most popular business women of Louisville, New Albany and Jeffersonville. The first prize consists of a $400 Kurtzman piano and a $250 Pianola and $50 worth of music for the Pianola. The second prize is a $300 piano, and the third prize is $200 in gold. The value of the prizes has made the contest very exciting, there being upwards of 56 contestants to date.

EXPERIENCES OF AN AMERICAN TELEPHONE ENGINEER IN ABYSSINIA.

AT the present time there are nearly 800 miles of telephone wires in Abyssinia, and enough more are being stretched to bring the total length to nearly 1,800 miles by the end of this year if nothing happens to stop operations.

An American engineer who laid out many of the routes and helped to install the first few hundred miles of wire, under contract with the Abyssinian Minister Jig, who initiated most of these improvements, says:

"There wasn't a thing that weather, man or beast could do to us that wasn't done. Tremendous rainfalls were the first source of damage. The water would literally pour out of the sky, and when the 'shower' was ended we had the pleasure of going over miles of line and resetting poles that had been washed out of their places by young floods.

"Scarcely had we begun to erect the poles before we found that they were falling again, mysteriously, as it seemed. Then we saw that we were up against the termites. As soon as wood was placed into the ground they were at it. You can see acres and acres of land in parts of Abyssinia that are as well cropped as if some one had gone over them with a giant lawn mower. That is the work of termites.

"Immediately after discovering this we ceased to erect wooden poles and used iron ones. Then man began his work. The natives saw great uses for the beautiful round iron posts, and whenever we had moved on a few miles they would sneak up

Digitized by Google

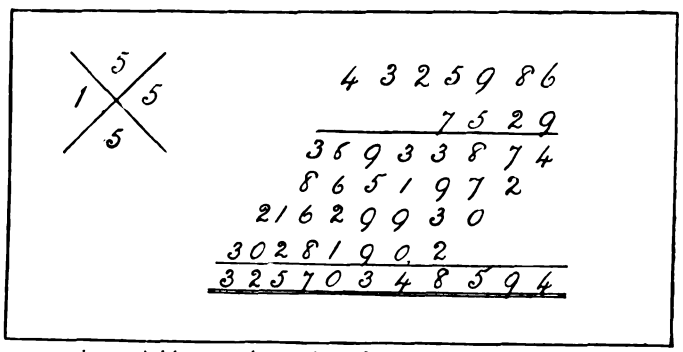
and tear them out. Finally King Menelik had to send messengers throughout the country proclaiming that extreme punishment awaited any who touched the telephone plant.

"Now that the wires are up and men leaving them alone, there is constant damage still. The monkeys of Abyssinia have discovered that they make magnificent trapeze wires, and they swing on them and play with them until they come down. The elephants, too, destroy a lot. They have found the iron posts very nice to lean against and to scratch their sides on, and as they were put in to support wires and not elephants, a few give way every day in the elephant regions.

"Inanimate nature also is at work continually to bother the telephone superintendents of Abyssinia. The jungle grows so fast that hardly a day passes in which it isn't necessary to send out a party to cut away some of it where it has reached to the wires. The worst trouble is from the huge creepers that grow over all the trees. They fall here and there all the time."

A MATHEMATICAL WRINKLE.

IT often occurs in the matter of making up estimates or accounts that multiplication sums of varied magnitude are involved, upon the correct result of which much depends. Since tables embracing large numbers are not always available, the following method of proof is suggested which is both simple and rapid. To the left of the sum draw a cross, as shown in the



example. Add together the figures of the multiplicand, divide by 9 and place the remainder, which is 1, to the left of the cross. Go through the same process with the multiplier, and place the remainder, 5, to the right of the cross. Then multiply the two figures on either side of the cross and divide by 9, placing the remainder at the top. In this case, the result, 5, cannot be divided, so it takes the place of the remainder. If the result is correct, then the remainder of its sum added together and divided by 9, must equal the figure at the top of the cross. There is only one possible point of error in this proof, and that is if the result of the multiplication should be 9 in excess or less than the correct amount the proof would be the same. The chances for such an error are remote and hardly worth considering. The space at the base of the cross is where the resultant of the last operation is placed, and indicates the correctness of the example.

UTICA HOME COMPANY'S IMPROVEMENTS.

A NUMBER of extensions and improvements are about to be made by the Utica (N. Y.) Home Telephone Company, among them the laying of 8,000 feet of underground cable. The company is equipping its switchboard so as to accommodate 800 additional subscribers, and in doing this work it will necessitate a large amount of work on the city lines, as well as the toll lines. Extensive construction work has been carried on at Cooperstown, Richfield Springs and other points in the company's territory. The Rome Independent Telephone Company is also getting ready to make several improvements. Two new sections to the switchboard will be made and 20,000 feet of aerial cable will be strung.

FREE TELEPHONE LINES IN INDIANA.

JOHN H. MURRAY, chairman of the board of commissioners of Jackson County, Indiana, is an advocate of free telephone lines, and says that the board of commissioners of Jackson County will build a free system of main telephone lines in that county, that the country youth may be encouraged to stay on the farm, instead of deserting it to go to the towns and cities to live.

Something must be done to bring this about, and free roads, free mail delivery and free telephone lines will all have a great tendency to do it. In fact, these conveniences, together with the interurban lines, make the county one vast town or city. Many farmers refuse to cultivate their land because they can not get farm hands, and this will have to be remedied some way. The question is—how? The telephone will help, says Commissioner Murray.

TELEPHONIC PRINTING.

M. MALCOTTI, an Italian engineer residing in Berlin, has invented an instrument which he calls a telecriptograph, which will reproduce in print all conversations held over the telephone. The young inventor claims that his instrument will work without extra wire and apparatus over any ordinary telephone line. Patents have been secured in several countries and in the United States, where he intends to install his service with the aid of some telephone company.

A NEW USE FOR THE TELEPHONE.

E. C. RIEGEL, formerly resident agent of the Ocean Accident & Guarantee Corporation, has instituted a new business enterprise in Cleveland which opens up new fields for the development of the telephone industry as applied to every day business. The system is called the Telagirl System, and has been evolved for the saving of time and expense to business men. The idea of the whole thing is to take charge of the stenographic work of various offices through the company's headquarters which maintains a staff of efficient stenographers. Telephones are installed without expense to the subscriber, connecting him with the company's headquarters which he can reach at any time. He is at once connected with a stenographer who takes his dictation either by notes or on the typewriter as preferred, using his personal stationery, which is of course kept on file. The finished work is then enclosed without folding in a large envelope, sealed and delivered at once by prompt messenger service. The monthly statements rendered to clients of the company are of particular value, as they are itemized in every detail, thus forming a valuable reference index of correspondence to the business man. The completest privacy is secured, each stenographer having a small room of her own so that messages can be repeated back to the client without being overheard by others.

SOME ARKANSAS RESOLUTIONS.

HOT SPRINGS, Arkansas, has two telephone systems, the Bell and Southern (Independent), and the way the city threw their support to the Southern Company is shown by the following resolutions, passed by a committee of the whole, representing the following organizations: The Retail Grocers' Association, 77 members; the Business Men's Mutual Association, 38 members; the Retail Druggists' Association, 20 members; the Retail Liquor Dealers' Association, 40 members, at a meeting held March 25, 1904:

Resolved, That our various organizations require but one telephone in their business houses and residences; that the service given us by the Bell Telephone Company has been unsatisfactory; therefore, be it further

Resolved, That on and after May 1, 1904, our respective organizations agree to discontinue the old telephone and use the new telephone exclusively. We shall use the telephone at the following rates: $2.75 per month for business telephone and $2 per month for residence telephone.

Resolved, That no matter what inducements shall be offered by competing companies, we shall confine ourselves to the new telephones so long as the service is satisfactory and the above prices maintained.

Resolved, That these resolutions shall not apply to the wholesale dealers belonging to the Retail Grocers' Association.

TELEPHONE PATENTS

IMPROVED TELEPHONE LAMP JACK.

H. P. Clausen, of Chicago, Ill., patents (No. 762,279) and assigns to the American Electric Telephone Company an improved telephone lamp jack. The object of this invention, which is shown in the accompanying illustrations, is to provide a simple and inexpensive form of lamp jack which can be readily removed from the switchboard for repairs, easily inspected, provide an insurance against short circuiting of the terminals and arranged to prevent false signals. The inventor provides a base plate of metal, *A*, having its edges, *a*, *a'* and *a''*, upturned as shown. Upon

Fig. 1.

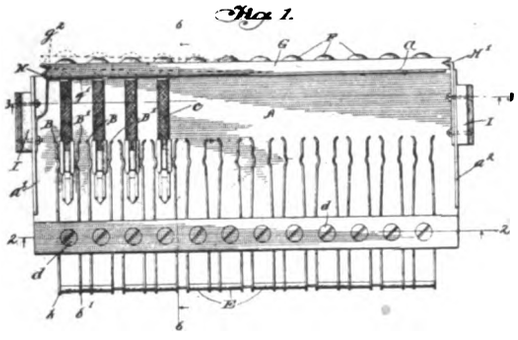

Fig. 2.

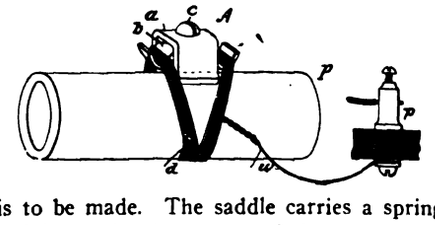
the rear of this base plate the strips *D* and *D'* are clamped by means of the screws, *d*. These strips support the springs which form the lamp jacks. The upturned edge, *a*, forms a backing for a strip, *G*, which is bored to hold the opals that form the lamp caps. The method of securing this strip is self-evident from the drawings. By means of the spring walls, *a* and *a'*, it is also evident that the strip can be easily removed for inspection. The portion of each lamp inside of the strip *G* is surrounded with a convenient opaque covering, which prevents the light of one lamp from shining into the opal of an adjacent one. By this means an exceedingly compact lamp jack is obtained.

IMPROVED GROUND WIRE CONNECTION.

J. J. O'Connell, of Chicago, Ill., patents (No. 762,341) an improved method of making a ground connection and assigns to the American Telephone and Telegraph Company. This device is shown in the accompanying illustration and consists of a saddle *a*, which is placed upon a pipe or other object to which a ground



connection is to be made. The saddle carries a spring *b*, which may be placed in tension by means of the screw *c*. A lashing of wire is placed in the u-shaped ends of the spring and around the pipe, then by tightening the screw *c* good electrical connection may be secured.

IMPROVED AUTOMATIC TELEPHONE SYSTEM.

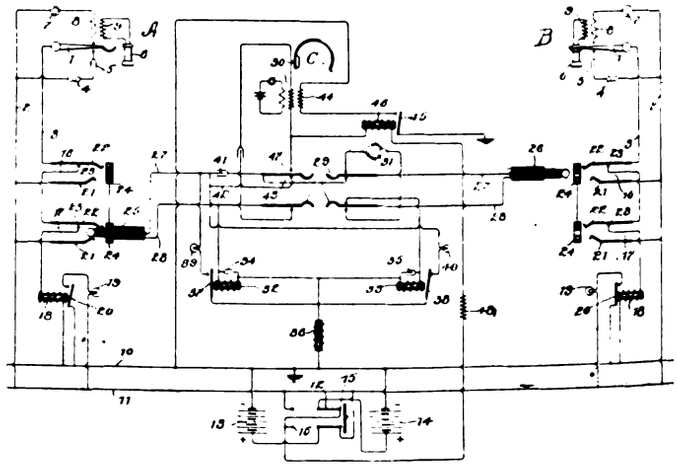
F. A. Lundquist, J. Erickson and C. J. Erickson, of Chicago, Ill. patent (No. 763,412) an improved automatic telephone system and assign to themselves, John Anderson, of Salina, Kansas, and Globe Automatic Telephone Company, of Chicago, Ill. This invention relates to an automatic telephone exchange to be used to make connections between subscribers operated by the subscribers themselves. The patent requires 10 sheets of drawings and 15 pages of specifications, and it is so intricate that it is impossible to condense even the essential features into the space limits. Those who are interested in this department of telephony are recommended to obtain the patents themselves.

SELECTIVE SIGNALLING SYSTEM.

G. Babcock, of Chicago, Ill., patents (No. 763,351) an improved selective signalling system and assigns to the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y. This invention employs the familiar step by step mechanism, whereby a series of electrical impulses operate the contact wheels located at the various substations. The device is so complicated that it requires three pages of drawings and 28 pages of specifications to describe, and we advise those who are interested therein to obtain the original patent, as the description far transcends our limits.

TELEPHONE SYSTEM.

W. M. Davis, of Chicago, Ill., patents (No. 763,374) and assigns to the Stromberg-Carlson Telephone Manufacturing Company an improved telephone system which is shown in the accompanying illustration. The object of this invention is to provide a telephone system in which there is an improved method of testing so that when the operator tests a line the subscribers will hear no click. The operation of this system will best describe it. The ordinary substations are shown at *A* and *B*. The removal of the receiver *A* completes a circuit through the line relay *18*, attracting its armature *20* and lighting the lamp *19*. The operator inserts an answering plug *25* in jack *17*, thereby breaking the contact between the spring jack *22* and extinguishing the line lamp *18*. The operator then connects her telephone with the circuit. The insertion of plug *25* closes circuit through



the supervisory relay *32* and energizes same and prevents the lamp *39* from lighting. Upon receiving the order the operator inserts the calling plug into jack *16*, and rings in the usual manner. When the subscriber *B* removes the receiver the supervisory relay *33* is excited, its armature attracted and the lamp *40* extinguished. The replacement of the receiver re-lights the supervisory lamps. Testing is performed as follows: The negative pole of the idle battery is permanently connected with the bus-bar *10* through the supervisory relays and impedance coil *36*. Thus the insertion of a plug raises the potential of the test-thimble to that of the negative pole of the idle battery. The manipulation of the listening key *29* connects the tip strands to the calling plug through the test relay *46*, the resistance *48*, the switch contact *15* and switch *12* to the positive pole of the idle battery. Then the application of the tip contact of the calling plug to a test thimble closes circuit through the idle battery *14*, and the operator is informed whether the line is or is not busy.

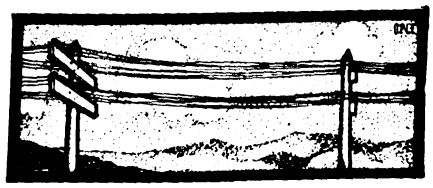
QUERIES

Questions on any subject relating to telephony will be answered on this page.



DUPLEX TALKING CIRCUIT.—(369.)

Has any arrangement of apparatus been devised which will allow two parties to use the same pair of wires at the same time? A. D.

As far as we are aware no system as you suggest has been devised. Numerous experiments have been conducted with this end in view, but without commercial success. The number of natural obstacles in the way, such as inductance capacity and the varying frequencies of the talking currents have so far proved insurmountable.

PLACING CROSS ARMS.—(370.)

As I am new at the business, will you please tell me how cross arms should be put on poles? P. M. B.

The method of placing cross arms is shown in Fig. 370. It will be noticed that every other cross arm is mounted on the opposite side of the pole. The reason for that is this: If for any reason one arm should be pulled off or one pole come down, if

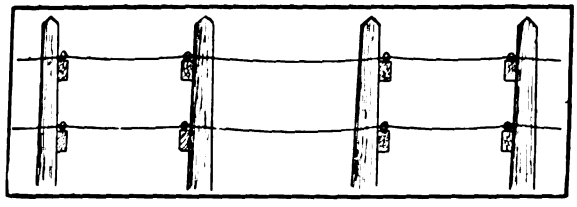


Fig. 370.

all the arms were on the same side as the falling cross arm or pole there would be a tendency to pull all the other arms off, whereas when they are placed as shown the poles act as a brace or stop and so prevent the line coming down unless the poles go with it.

STROMBERG-CARLSON CIRCUITS.—(371.)

Can you give diagrams of the Stromberg-Carlson central energy multiple board line circuit, also cord circuits of local to toll and toll to local? R. G.

The Stromberg-Carlson Telephone Company has issued a large number of various circuits. If you will specify which ones you desire we will endeavor to obtain the same for you.

CHANGE SERIES TO BRIDGING.—(372.)

We have a number of series telephones on our lines; we wish to change them to bridging. Can you give us any information as to how to go about making the change? N. T. C.

To change series to bridging instruments is in almost all cases impracticable if not impossible. Aside from the difference in circuit connections the generator and bells would have to be materially changed. Series ringers have a resistance of about 80 ohms, whilst bridging bells vary from 1,000 to 1,500 ohms. It is therefore doubtful if you could rewind the spools and get on enough wire. Series generators have a comparatively small current output, and on account of the weakness of the magnetic field it is doubtful even if the armatures were rewound whether it would be possible to ring any of the bells. Your best plan would be to see whether you could mount a bridging bell and the right size generator in the bell box; if not, to secure new magnetos which would be the most satisfactory change to make.

IRON OR COPPER CIRCUITS.—(373.)

We wish to build some new lines. Which would be better to use, iron wire and put fewer parties on a line, or to use copper and put on more? X. Y. Z.

With the information you have given us it will be practically impossible to answer your query except in a general way. From the point of transmission and length of life a copper circuit is far superior to iron. Again, if the lines are at all long, iron wire, on account of its resistance, is impractical. If your switchboard is of a central energy type then copper wire must be used on all but very short lines on account of the drop of potential and consequent decrease in amount of current available to successfully operate the transmitter. It is our opinion that under all circumstances copper is far superior to iron and even if the cost necessitates placing more parties on a line it is better policy to do so.

TRANSPOSING.—(374.)

We have quite a dispute over transposing lines and want you to help us out of the difficulty. Does it make any difference whether or not left is carried over right or right over left one time and then the next reverse? When you start with left over right, don't you have to keep left over right for each and every transposition? In other words, don't you have to keep the same side over and the same side under all the way like you start, and not have one over and the next time have the same side under? P. W. S.

In a telephone cable each pair of wires is twisted in such a manner that both revolve about an axis which passes through the center of the twist. The theory of making telephone transpositions is exactly the same as that of making twisted pairs; that is to say, the two sides of the line should revolve about each other and there should be, theoretically, no difference between the twisted pair of a cable and the twisted pair of aerial lines, excepting that the twists in the aerial line are usually 1,000 or 1,500 feet in length, while those of the cable are only 4 or 5 inches in length.

Any practical method which accomplishes this twisting of the circuit is sufficient for transposition, as the wires of an aerial line must be supported upon insulators. Practical considerations require the passing of one wire first above and then below another, but all that it is necessary to keep in view is that the twisting should be carefully and thoroughly carried out.

FALSE BUSY TEST.—(375.)

Could you please explain what is meant by a "false busy test?" J. C.

A false busy test upon a common battery system is one in which the sleeve or thimble of the jack has battery crossed with it, so that when the operator touches the sleeve with the tip of the cord, which is grounded, a circuit is closed through the test circuit of the listening set and indicates that the line is busy. The normal condition of the sleeve of the jack being grounded when a test for busy would give no results. Should the line be in use, the sleeve of the plug in another position or in the answering jack would supply battery to the sleeve of the line that might be tested, and so indicate that it was in use.

POSITION OF GUY WIRE.—(376.)

Where should a guy wire be placed so as to strengthen a pole? J. D.

The correct point to fasten a guy wire is between the cross arms, where the resultants of the forces are equal. Many specifications, however, state that the guy wires shall be placed as near to the lowest cross arm as possible, so as to prevent the guy wire interfering with the lines. This point is shown at *a* in Fig. 376.

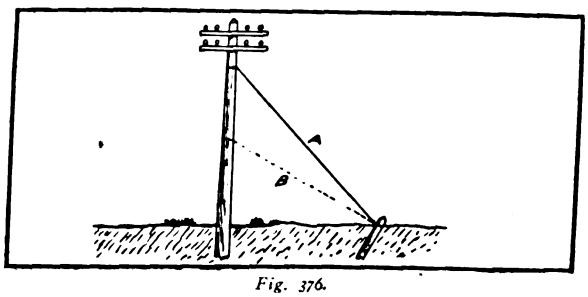

Fig. 376.

The greatest strain upon a pole is at the point of support, consequently if the guy wire is placed as at *B* the leverage strain will be greatest at this point and the protection desired by means of the guy wire is lost, whereas if the guard is fastened as at *A* the liability of the pole breaking is much reduced.

THE WEEK'S MESSAGES

FINANCIAL.

MINNEAPOLIS, MINN.—The board of directors of the Tri-State Telephone & Telegraph Company has declared a semi-annual dividend at the rate of 5 per cent. on the common stock of the company.

SOUTH DOVER, MICH.—The South Dover Telephone Company has increased its capital stock from $1,000 to $2,000.

MINNEAPOLIS, MINN.—The board of directors of the Twin City Telephone Company has declared a semi-annual dividend at the rate of 5 per cent. on the common stock.

MANSFIELD, TEX.—The Mansfield Telephone Company has increased its capital stock from $4,000 to $5,000.

FRANCHISES.

EUSTIS, FLA.—H. W. BISHOP has secured a franchise for constructing a telephone system here.

BLAKELEY, GA.—The Blakeley Telephone Company has been granted a franchise by the city council of Albany to construct and operate its system in that town.

MINNEAPOLIS, MINN.—The Tri-State Telephone Company, the long distance branch of the Twin City Telephone Company, has been granted a franchise by the city council of Willmar.

PERTH AMBOY, N. J.—The Hudson & Middlesex Telephone Company has applied for a franchise in this city.

RED CREEK, N. Y.—John A. Driscoll, of Rochester, chief manager of the Wayne-Monroe Telephone Company, has been granted a franchise by the city council. The company is now building west of Wolcott.

CINCINNATI, O.—The Queen City Telephone Company has applied for a franchise in St. Bernard.

CINCINNATI, O.—It is understood that the Queen City Telephone Company will ask the city council of Covington, Ky., for a franchise.

MT. PLEASANT, O.—The county commissioners have granted the Mt. Pleasant Telephone Company, on request, the right to construct lines along the highways of the county.

CORVALLIS, ORE.—The city trustees have granted a franchise for an Independent telephone company.

BROWNWOOD, TEX.—The Central Texas Telephone Company has applied to the city council of Brownwood for a franchise for the establishment of a telephone system here.

DALLAS, TEX.—F. B. McElroy, of Chicago, who represents the proposed Dallas Independent Telephone Company, has telegraphed his intention of making a deposit of $5,000 as an earnest of good faith in his application of a franchise.

DALLAS, TEX.—A. L. Waterbury and Charles Webster, Minnesota capitalists, have deposited with the city treasurer $5,000 as an earnest of good faith in their application for an Independent telephone franchise.

COMBINATIONS.

BROWNSTOWN, IND.—The Brownstown Telephone Company has purchased the property of the Jackson Telephone Company with a small exchange at Tampico.

MONMOUTH, N. J.—The Monmouth Toll Line Company has purchased the Red Bank Independent Telephone Company's property.

CARTHAGE, N. Y.—The stock of the Northwestern Telephone and Telegraph Company, of Carthage, has been purchased by J. K. Whittaker, treasurer of the Citizens' Telephone Company of New York. The Carthage exchange will be under the management of C. D. Warner, manager of the Citizens' Telephone Company, of Watertown. Many improvements are contemplated.

BELLAIRE, O.—It is rumored that the Ohio Valley Telephone Company of Bellaire, has been sold to J. B. Driggs.

PARKERSBURG, W. VA.—At a meeting of the stockholders of the West Virginia Western Telephone Company, it was decided to merge the interests of that company with the Marietta Independent Telephone system. This was done to retain the services of J. H. Linginger, president, and A. C. Davis, general manager, who were large holders of stock in the Marietta company, and who had intended to resign in order to give all their time to that company's interests.

MISCELLANEOUS.

DOUGLAS, ARIZ.—The Douglas Improvement Company is distributing a new directory, which shows a marked increase of subscribers over the previous issue.

PINE BLUFF, ARK.—The Pine Bluff Telephone Company's system here was seriously damaged by lightning recently.

OTTAWA, ILL.—The Ottawa Home Telephone Company has let the contract for the remodeling of the new building it will occupy.

CHIHUAHUA, MEXICO.—A long distance telephone system will be established here to connect all towns and mining camps throughout the State. L. J. Arellano, of Chihuahua, is the prime mover of the organization.

CULIACAN, MEXICO.—The State government of Sinaloa has prepared plans for the construction of an extensive system of telephone lines in this State. It is proposed to connect every town of importance in Sinaloa with Culiacan, the State capital. The line which was recently completed from Culiacan to Mazatlan is to be extended in various directions. The plans of the State government contemplate giving the State of Sinaloa more miles of telephone than any other State in Mexico.

PERSONAL.

W. R. BLODGETT, of Battle Creek, Mich., has been appointed manager of the Eaton County Telephone Company, with headquarters at Charlotte.

A. H. FOSTER has resigned as superintendent of the Rochester, Minn., Telephone Company.

A. A. GARRIS has resigned as manager of the Iron Range Telephone Company's exchange at Bemidji, Minn.

J. J. LANE has been appointed manager of the telephone exchange at Colfax, Wash., to succeed E. C. Drews, who has resigned.

GEORGE N. PIERCE, formerly representative of the Vought-Berger Company, of La Crosse, Wis., has been compelled through ill health to resign his position.

G. F. STEARNS has been appointed manager of the Enterprise Telephone Company of New Hardwick, Minn.

UNDERGROUND.

WILMINGTON, DEL.—The Delaware & Atlantic Telephone Company is arranging to put all its wires in Wilmington underground.

KNOXVILLE, TENN.—The People's Telephone Company is extending its underground system throughout the city.

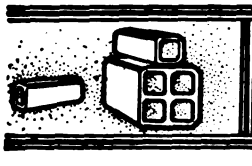
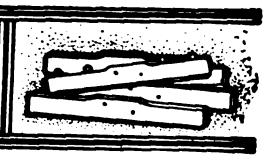
Auville, president; Dr. Kardy, vice-president; B. F. Williams, secretary and treasurer; R. R. Smith, manager. The company was organized to build a telephone line from Iaeger, in McDowell County, to Tazwell, Va., a distance of thirty-five miles, work upon which will be begun at once and pushed to completion.

POINT PLEASANT, W. VA.—The Point Pleasant Telephone Company has been chartered to construct, maintain and operate telephone lines and central exchanges. Capital, $50,000. Incorporators: Wm. M. Haynes, C. C. Bowyer, Homer Smith, T. Stribling, J. S. Spencer, John McCullough, F. B. Tippett, E. B. Jones, Point Pleasant, W. Va.



New Construction in the Field



GREENVILLE, ALA.—It is stated that J. H. Riviere & Co. will put in a telephone system here, work to begin at an early date.

ELKHART, IND.—The Home Telephone Company, of Elkhart, is extending its lines with a view to connecting with the Granger exchange.

TERRE HAUTE, IND.—The Citizens' Telephone Company has extended its toll line to Lewis, and is contemplating other extensions and improvements.

WORTHINGTON, IND.—The Worthington Telephone Company is at work extending its lines. A new cable will be placed in position and the entire plant rearranged. It is also arranging for connecting with others in the new territory.

DES MOINES, IA.—The Hawkeye Telephone Company is arranging to install an exchange at Fort Des Moines with 100 subscribers, most of which will be on rural lines surrounding the post.

ELKADER, IA.—The Interstate Telephone Company is putting in a toll line from Mederville to Elkader.

SIOUX CITY, IA.—The Sioux City Telephone Company will build a new three-story stone and brick building, at a cost of $25,000.

CLEARWATER, KANS.—The Farmers' Mutual Telephone Company, of Clearwater, expects to build three new lines to connect fifty farmers in the future.

CONWAY SPRINGS, KAN.—The Home Telephone & Electric Company, of Conway Springs, has completed a toll line to Norwich, Kans. It will commence work on rural lines at once, as a number of orders for farmers' telephones are on file.

HARRIS, KANS.—The Harris Telephone Company is building several miles of new lines connecting Westphalia and Pottowatomie to Harris, and will build other lines as fast as possible.

LE ROY, KANS.—The Le Roy Telephone Company will build a toll line to Northcott and Aliceville.

LOUISVILLE, KY.—The Home Telephone Company has made arrangements to place an exchange in Shelbyville.

BLY, MO.—Frank Crowly is constructing an Independent telephone line from Bly to Bakerfield.

GREEN CITY, MO.—The Union Telephone Company is installing a new switchboard here and will construct several new lines. Charles Hill is superintending the work.

SPRINGFIELD, MO.—J. J. Speed, manager of the Home Telephone Company, has gone to Chicago to purchase the necessary equipment and material to increase the capacity of the local exchange from 1,800 to 2,500 lines. Mr. Speed will contract for 47,000 feet of cable, new switchboard sections and telephones.

WEST PLAINS, MO.—C. H. Gale, owner of the West Plains Telephone Company, and W. N. Hicks, owner of the Willow Springs Telephone Company, are constructing a line connecting West Plains with Willow Springs.

GREAT FALLS, MONT.—Duncan Cameron, of Black Butte, has arranged for the construction of a new telephone line from Great Falls to Eden, Meisenbach, Black Butte and Evans.

GRAND ISLAND, NEB.—The Grand Island Telephone Company has a large force of men at work constructing its new system.

ALAMOGORDO, N. M.—The Alamo Telephone Company will extend its lines to Weed.

HOOSICK FALLS, N. Y.—At a meeting of the directors of the Eastern New York Telephone and Telegraph Company, a semi-annual dividend of 3 per cent. was declared. C. B. Story was awarded the contract for the extension of the company's lines.

LE ROY, N. Y.—The Inter-Ocean Telephone Company is building new lines in this vicinity.

RANDLEMAN, N. C.—The Randleman Telephone Company will connect its exchange at High point with other systems in the neighborhood.

HIGH POINT, N. C.—The High Point Telephone Company and the Randleman Telephone Company are erecting a copper circuit from High Point to Randleman, a distance of about twenty miles. A copper circuit from High Point to Thomasville was completed several weeks ago.

CADIZ, O.—The United States Telephone Company has commenced the construction of lines between Cadiz and Uhrichsville.

LEETONIA, O.—Henry A. Halverstadt contemplates the formation of a telephone company in this vicinity to construct and operate an Independent telephone system.

GRANT'S PASS, ORE.—J. H. Cradelbaugh, of the Merlin Townsite Company, states that the company will build a telephone line from Merlin to Glace.

DOYLESTOWN, PA.—The Standard Telephone Company's lines were damaged to the extent of several thousand dollars by a storm.

READING, PA.—The Consolidated Telephone Company has decided to extend its lines to West Reading and Mount Penn Borough. The West Reading line will be extended to Wyomissing and the river will be crossed by means of a cable.

CLARKSVILLE, TENN.—About 100 subscribers have been secured to a petition asking the Home Telephone Company of this city to construct a line to Trenton and install an exchange there.

HONEY GROVE, TEX.—A. L. Hill, formerly manager of the telephone company at Smithville, Tex., will install a telephone system at Honey Grove.

BEYERSVILLE, TEX.—A telephone line is to be built between this place and Taylor, Tex., a distance of six miles. William Rummell and Robert Stummhofer, of Beyersville, are interested in the project.

LA CROSSE, WIS.—The Pine Creek Valley farmers have organized an Independent telephone company to connect with the La Cross Telephone Company's lines.

PORTAGE, WIS.—The Portage Telephone Company is completely rebuilding its plant, placing all of the wires in the business portion of the city underground. After the construction is completed and the changes made in apparatus, it will have one of the most thoroughly up-to-date telephone exchanges in the Middle West.

MONROE, WIS.—The Belleville Telephone Company has leased the line to Dayton and constructed a line to Basic, and also lines north and west from Paoli.

RACINE, WIS.—The Badger Telephone and Telegraph Company will extend its line from Eikhorn to Racine and toll lines will be built to St. Paul and Minneapolis.

WILTON, WIS.—The Ontario & Wilton Telephone Company will build an additional mile and a half of line to accommodate the large number of subscribers recently secured.

TRADE NOTES

THE MONARCH ELECTRIC & WIRE COMPANY, 125 S. Clinton street, Chicago, Ill., has recently shipped several carloads of telephone supplies out West. Its western business is very encouraging and business in general is good.

THE CONNECTICUT TELEPHONE & ELECTRIC COMPANY, of Meriden, Conn., reports large sales of its weatherproof iron box telephone, which is especially designed for mine, street railway and police systems. The company will send its large and new catalogue, which is profusely illustrated with telephone material, on request.

THE INTERNATIONAL TELEPHONE MANUFACTURING COMPANY, of Chicago, has completed delivery of the new exchange equipment for the Portage Telephone Company, Portage, Wis. It consists of its latest type of lamp line central energy apparatus arranged for an ultimate capacity of 1,200 lines, with 500 lines equipped. The International also furnished all of the

Digitized by Google

auxiliary apparatus for the local exchange, consisting of storage batteries, power board, charging machines, battery cabinets, protective devices, etc., and will also furnish an initial order of 400 central energy telephones.

THE KESTER ELECTRIC MANUFACTURING COMPANY, of 44 to 56 N. Union street, Chicago, Ill., is loaded up with orders for its self fluxing solder. No new orders are being taken until after present ones are filled.

THE CRAWFORDSVILLE WIRE NAIL COMPANY, of 1501 Monadnock Block, Chicago, Ill., reports extraordinary sales of galvanized wire for telephone purposes. The factory is running overtime to keep up with orders on hand and coming in.

THE MANHATTAN ELECTRICAL SUPPLY COMPANY, of 186 Fifth avenue, Chicago, Ill., has had to supply an increased demand for general construction material, and for the last few months has enjoyed a very heavy run on its "Mesco" dry batteries for telephone use.

THE OHIO VALLEY GLASS TELEPHONE COMPANY, of 1501 Monadnock Block, Chicago, Ill., has closed its factory until August 15th, and if hot weather continues will not open up full force until September 1st. At present the company is fifteen carloads behind on stock orders.

THE BAIRD MANUFACTURING COMPANY, of 35 Michigan street, Chicago, Ill., has recently gotten out a new 32-page catalogue on telephone, pay-station and measured service equipment. It fulfills its mission very well by being well written and excellently illustrated. The business of the company is in a very healthy state, in fact, so much new business has been coming in that the factory has not been able to keep up with it.

G. M. GEST, the expert subway contractor, of New York and Cincinnati, has just been awarded a large contract for the construction of a conduit system through the lower part of Brooklyn, leading from the new power house of the Brooklyn Heights R. R. Co. to their new substation. The same contractor was awarded a contract for the construction of an extension to the subway of the Brooklyn Edison Electric Illuminating Company.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, of Buffalo, N. Y., has recently issued Bulletin No. 11, describing its transfer type switchboards for common battery and magneto systems. Besides very thoroughly describing the boards, particular attention is given to the accessories, such as signal bells, plugs, ringing and listening keys, operators' transmitters and receivers. The company's make of substation instruments is also included in the descriptive matter. The bulletin is profusely illustrated with half tones of the apparatus, together with pictures illustrating recent switchboard installations. To all interested the company will mail this bulletin upon request.

FRANK B. COOK, of Chicago, Ill., has completed the shipment of a large distributing frame for the automatic exchange of the Home Telephone Company, of Los Angeles, Cal. This is what Mr. Cook styles his No. 444, with self-soldering heat-coils, and the frame is equipped for 4,875 pairs. He previously equipped the manual exchange of the Home Telephone Company with a frame having a capacity of over 10,000 pairs, and using Cook's well-known No. 4 protectors. Mr. Cook has also recently filled large orders for his protective devices from the Pittsburg & Allegheny Telephone Company, and from the Kellogg Switchboard & Supply Company, for their Louisiana Purchase Exposition exchange. A large order has also been received from Rome, Italy, showing that Cook's apparatus is well known in foreign countries as well as the United States.

THE STERLING ELECTRIC COMPANY is furnishing its different types of protective device to the following points: Newton, Ill.; Sparta, Wis.; Hoosick Falls, N. Y.; Chester, N. Y.; Columbia, Mo.; St. Louis, Mo.; Atlantic, Ia.; Kansas City, Mo.; Indianapolis, Ind.; Portland, Ind.; Deposit, N. Y.; Lyons, Ia.; Tiffin, O.; Columbus, O.; Crosswell, O.; Utica, N. Y.; Vassar, Mich.; Atlanta, Ga.; Lincoln, Ill.; Bay City, Mich.; Papillion, Neb.; Sheboygan, Wis.; Novinger, Mo.; Cairo, Ill.; Columbus, Ind.; Neosha, Mo.; Lincoln, Neb.; Birmingham, Ala. The Sterling Electric Company is also furnishing switchboard equipment of its well known single relay, common battery Bell type boards for Attica, Ind.; Deposit, N. Y.; Elkhart, Ind.; Tiffin, O.; Charleston, Ill.; Lyons, Ia.; Ottawa, Kan.; Crosswell, O.; Boswell, Ind.; Novinger, Mo.; Buck Creek, Ind.; Burr Oak, Mich.

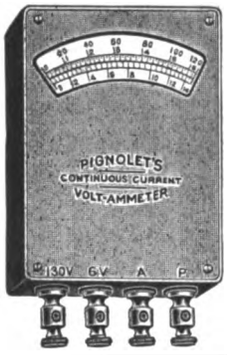
Agencies and Branches

NEW YORK SAN FRANCISCO CHICAGO PHILADELPHIA CLEVELAND ATLANTA

You Will Find It Pays To Test



your lines periodically for insulation and resistance, This can be best done with a Volt Ammeter. Mine are especially designed for this branch of telephone work and are low in price.

LOUIS M. PIGNOLET

Originator of the Voltmeter Habit. 78 CORTLANDT ST., NEW YORK

One Man

out of one hundred interviewed said he preferred a monthly paper.

"Why?" he was asked.

"Because" said he, "the monthly is larger."

He was not pressed to subscribe to The American Telephone Journal, because—well the reasons are entirely obvious.

Gentlemen:-

In referring to your favor of the 1st., will say that it gives me much pleasure to state that the companies I represent have in the neighborhood of fifteen hundred Swedish-American telephones working , both central energy and magneto , bridging and series , desk sets of both systems . They are giving entire sarisfaction .

In addition to the satisfaction derived from the use of your equipment , our companies have always found your house willing and ready to promptly rectify any defects that have shown up in the use of so many instruments , in addition , according to us all the courtesies that any one could reasonably ask .

The telephones and treatment have been entirely satisfactory.

Yours truly
Theodore Gary

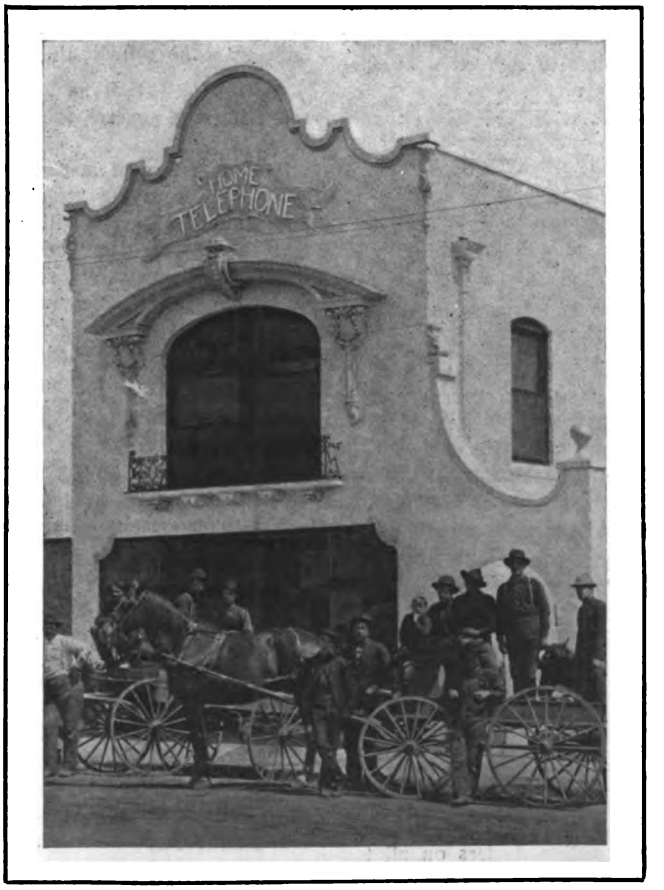
VOLUME 10 SATURDAY, JULY 16, 1904 NUMBER 3

THE SANTA BARBARA (CAL.) EXCHANGE

SANTA BARBARA is situated on the shore of Santa Barbara Channel, in Southern California, and is the county seat of Santa Barbara County. For a long while the need of an Independent exchange had been felt, but for some reason not altogether clear it was some time before a franchise was obtained, and only then after a hard struggle. Independent systems had grown up in every direction and it was necessary to obtain connection with Santa Barbara to establish a connecting link between the north and south. After the franchise had been secured, the company, known as the Santa Barbara Home Telephone Company, immediately commenced work. This was less than a year ago, and by April 1st, when the system was placed in operation, over 500 subscribers had been secured.

It was not expected that with so small a population (3,000) and such an aggressive opponent as the Pacific States Telephone Company, that the number of subscribers would exceed 600, but the report for July 1st shows a total in service of 752, and, what is more important, each and every one has a direct wire. This direct wire service is a feature of the company. The construction work was carried to completion by the Empire Construction Company, of Toledo, Ohio, under the effective direction of Mr. F. F. Graves, Mr. F. W. Wachter, the general superintendent, and Mr. Chas. Zahn, the engineer. A splendid building, built and owned by the Home Company, was erected on West Carrillo street, near State street, and is shown in the illustration.



The Santa Barbara (Cal.) Exchange.

The Santa Barbara Home Telephone Company is a strictly local organization, its stock being held exclusively by citizens of Santa Barbara and vicinity. Among subscribers to the stock are bankers, merchants, doctors, lawyers, school teachers, mail carriers, in fact, every industry or business is represented upon the stock records of the company. The officers of the company are: President, F. R. Vail; vice-president, Edward A. Gilbert; secretary, James R. H. Wagner; treasurer, Alfred Edwards. The directors are: D. S. Cook, John F. Diehl, and Charles F. Carrier. The position of general manager was given to Mr. Arthur E. Madison, a young man of exceptional commercial ability who made his debut with the Empire Construction Company.

The exchange equipment is of the highest order throughout, being central energy, with an ultimate capacity of 1500 lines. The switchboard is standard in design, mahogany finish. The combination night toll position forms part of the main board, but it is the intention at an early date to have a special toll desk for day use.

The lines connecting with Los Angeles, a distance of 125 miles, are now in operation and doing good work. Every detail of the switchboard has been watched carefully with a view to accuracy combined with speed. The battery room, relay rack, main and intermediate frames are in rooms separate from the main switchroom. The battery plant is the standard Chloride type, and consists of two sets of batteries of 11 cells each. These are charged by a Holtzer-Cabot motor-dynamo. The power board is of marble, with all the necessary switches, fuses, rheostats, etc., for properly operating the various circuits. These circuits are protected by standard Maxstadt fuses of suitable capacity. The volt and ammeters are also mounted on this power board, and close to it, and connected by switches, are two ringing generators, one operated by the power circuit and one by the batteries, the latter to be used only in case of break down. All the machines are mounted on solid foundations to reduce the vibration.

A chief operator's and wire chief's desk of the standard type form part of the equipment. The latter being supplied with suitable testing apparatus, so as to enable him to make the necessary tests to locate trouble, etc.

Santa Barbara is in direct telephonic communication with over 60 towns and cities in Southern California, among which may be mentioned Los Angeles, which has 15,360 subscribers, San Bernardino, Pasadena, Ventura, Arcadia, Hollywood, San Fernando, Redlands, Whittier, and Glendale. A branch exchange has been established at Montecito, which has so far 100 subscribers.

Southern California has been very friendly to the Independent movement, and the people as a whole have appreciated the great benefits it has brought them. That this is true is apparent by the thoroughness with which the whole of the country is being exploited for independent systems. The future of this section is unlimited, and the development which we might say has only just begun, is bound to continue and increase in proportion with the many other interests which are making Southern California to-day one of the best business fields in the country.

That this situation is appreciated by many, is evidenced in the steady stream of emigration which is gradually populating the whole of Southern California.

TOLL AND TRAFFIC RULES ADOPTED BY N. Y. STATE INDEPENDENT TELEPHONE ASSOCIATION

OWING to the great increase of toll business of the various Independent companies forming the New York State Independent Telephone Association, a special traffic committee was appointed to investigate ways and means of handling the business in the most equitable manner, with reference to the compensation due the various companies over whose systems a message might pass; and also to consider the time and rate schedules. The recommendations of this committee submitted to the Executive Committee at the convention of the Association held at Buffalo and adopted are as follows:

MILEAGE.—We recommend that the air line mileage between any two given stations be used as a basis for determining tariff between the said stations, and that the United States Post Route map be adopted as a standard for determining air line distance; that for the purpose of facilitating the computing of mileage tables the so-called Ohio block system be adopted, and mileage tables be made up of distances between centers of block, the air line distances adopted between any two stations being the distance between the centers of the respective blocks in which said stations are located.

RATES.—We recommend the adoption of tariff rates based on a minimum charge of six-tenths cent per air line mileage for each conversation not exceeding three minutes' duration, but recommend the adoption of special rates necessary to meet competition.

We also recommend that the minimum rate between any two stations be fixed at ten cents, and submit the following scale of rates, based on air line distances, subject to correction by special rates necessary to meet competition:

Stations in same block	$0.10
10 to 19½ miles	.15
20 to 24½ "	.20
25 to 29½ "	.25
30 to 34½ "	.30
35 to 39½ "	.35
40 to 44½ "	.40
45 to 49½ "	.45
50 to 59½ "	.50
60 to 69½ "	.55
70 to 79½ "	.60
80 to 89½ "	.65
90 to 99½ "	.70
100 to 119½ "	.75
120 to 139½ "	.85
140 to 159½ "	1.00
160 ta 179½ "	1.10
180 to 200 "	1.20

The above rates subject to special rate charge to meet competition.

TIME LIMIT.—We recommend the adoption of a three-minute time limit for all toll messages, wth the following charges for each additional minute in excess of the three-minute limit:

First 3 min.	Each add. min.	First 3 min.	Each add. min.
$0.10	$0.03	$0.95	$0.30
.15	.05	1.00	.35
.20	.05	1.05	.35
.25	.05	1.10	.35
.30	.10	1.15	.40
.35	.10	1.20	.40
.40	.15	1.25	.40
.45	.15	1.30	.45
.50	.15	1.40	.45
.55	.20	1.50	.50
.60	.20	1.60	.55
.65	.20	1.70	.55
.70	.25	1.80	.60
.75	.25	1.90	.65
.80	.25	2.00	.65
.85	.30	2.25	.75
.90	.30	2.50	.85

We recommend the use of time-recording devices on all toll boards wherever practicable.

DIVISION OF TOLL REVENUE BETWEEN TOLL LINE COMPANIES.—In the division of toll revenue between toll line companies we recommend that after deducting the originating commission the remainder of the total toll tariff be divided between the connecting companies in proportion to the ratio existing between the air line distances from point of origin to the point of transfer, or switching point, and the air line distance from the point of transfer to the point of destination, each toll line company assuming the mileage of and settlement with its own connections.

NIGHT RATES.—We recommend the adoption of the following night rates between the hours of 6 P. M. and 6 A. M.:

Day Rate.	Night Rate.	Day Rate.	Night Rate.
$0.10	$0.10	$0.95	$0.50
.15	.15	1.00	.50
.20	.20	1.05	.55
.25	.25	1.10	.55
.30	.25	1.15	.60
.35	.25	1.20	.60
.40	.25	1.25	.65
.45	.25	1.30	.65
.50	.25	1.40	.70
.55	.30	1.50	.75
.60	.30	1.60	.80
.65	.35	1.70	.80
.70	.35	1.80	.90
.75	.40	1.90	.95
.80	.40	2.00	1.00
.85	.45	2.25	1.15
.90	.45	2.50	1.25

TARIFF DIVISION BETWEEN TOLL COMPANIES AND EXCHANGES HAVING NO TOLL MILEAGE.—We recommend that all stations originating toll messages be paid, as compensation therefor, a commission on all toll business originated whether sent paid or sent collect.

REPORTING TOLL BUSINESS.—We recommend that each exchange or toll line company make a monthly report embodying a full statement of business sent and business received by it to the toll line company with which its settlements are made not later than the 10th of the following month.

METHOD OF HANDLING TOLLS.—We recommend the adoption of the following general rules to govern the transmission of toll messages:

Toll operators at stations originating calls to answer calling subscriber by saying "toll" only. After subscriber gives name and address of party with whom he desires to converse, operator to ascertain name, address and telephone number of calling party, and immediately record same on a ticket furnished for that purpose. If a messenger is required to reach party wanted, or if there is a long delay, originating operator to report back to calling party. Operator at receiving station, when called, operator to answer by giving name of station only, and to record name and station of calling party; also name and address of party called. On completion of conversation both operators to record the following information on their respective tickets:

Time conversation commenced.
Time conversation was completed.
Amount of tariff.
Amount of messenger fee, if any.

and if charges are reversed, tickets to be stamped "reversed." Operators to immediately compare tickets on completion of call.

HANDLING OF FRANKED BUSINESS.—Operators to make a ticket for all messages sent and received; no ticket to be marked "deadhead."

All business subject to frank to be accounted for and reported in the regular manner as if paid tolls, and an adjustment of free business to be made between connecting companies in their general settlements.

TOLL STATIONERY.—We recommend that the association be empowered to purchase in wholesale quantities all necessary tickets. report blanks, special forms, routing and tariff books which may be adopted by the association, and that the association be empowered to furnish these to members of the association only, at actual cost with 10 per cent. added.

Digitized by Google

TOLL ACCOUNTING.—We recommend the following general plan for accounting toll business:

All sent and received tickets to be grouped according to the station with which business has been transacted, one group for each station, and the summaries entered daily on a toll ledger prepared for that purpose. The information to be recorded as follows:

Amount of tolls sent paid.
Amount of tolls sent collect.
Amount of messenger fees collected
Total number of messages received.
Amount of tolls received paid.
Amount of tolls received collect.
Messenger fees paid.

At the close of the month the footings on daily toll ledger to be grouped on to a monthly check report, showing the totals of business between reporting station and each station to which it sends business and from which it receives business. This report to be used as a basis in settlement of business between connecting companies.

DIVISION OF TARIFF BETWEEN A GROUP OF COMPANIES AND A TOLL LINE.—We recommend the following plan for adjusting division of revenue between a group of companies operating in a limited district, each connected with the other, and one of which connects with a toll line and the connecting toll line:

For division of revenue treat the group of connecting companies as a toll line company, allowing the grouped lines, air line mileage from various originating points to the point where its line meets those of the toll line company, and allowing toll line company its mileage on the same basis, the toll line company to settle with the line with which it immediately connects, and this line (one of the group) dividing the net revenue which it receives from settlement with main toll line among the other lines comprising the group in proportion to the mileage the line has in.

We recommend the formation of local associations by short line companies connecting and operating in a limited district, in which case the association may be treated as a toll line company in making settlement with other toll line companies with which it connects.

In the division of tariff between two groups of short line companies the same general plan to apply, each group being considered as a toll line company.

FORMS FOR ACCOUNTING.—We recommend the adoption by the association of uniform toll tickets, daily toll ledgers, monthly check reports and subscribers' toll bills.

TICKETS.—For recording sent messages we recommend the adoption of a white ticket, approximately 3x4 inches, with space for telephone number of calling party, date, calling party's name, calling party's address, name of party called, address of party called, time conversation commenced, time completed, total minutes used, operator's number, amount of toll, amount of messenger, total charge for call, ticket to be printed "sent."

For recording received business use pink ticket printed "received," otherwise same as sent ticket.

DAILY TOLL LEDGERS.—Daily ledgers of 100 pages, alternate sheets to be perforated, size about 8x10 inches, ruled in columns as follows:

Offices.
Number of messages sent.
Overtime.
Tolls sent paid.
Tolls sent collect.
Messenger fees collected.
Number of messages received.
Overtime.
Tolls received paid.
Tolls received collect.
Messenger fees paid.

On head of each page should appear name of originating station and station from which business has been received, or to which business has been sent. A separate page in daily toll ledger to be used for each station with which reporting station does business, pages to have thirty-one (31) lines to enable reporting station to record on one sheet a full month's business between two stations.

MONTHLY REPORT BLANKS.—This report to contain a summary of a month's business of station, single sheets about 18x 11½ inches, to be headed as follows:

Check report of ..... office, month of ....., otherwise monthly check report to be ruled the same as daily toll ledger. This report to contain a summary of daily toll ledger sheets.

METHODS OF DETERMINING BALANCES DUE IN GENERAL SETTLEMENT.—We recommend the universal adoption of the following plan in arriving at settlements between exchanges and toll line and between toll line companies, company originating business to be charged with the following items:

Tolls sent paid.
Tolls received collect.
Messenger fees collected.

and to be given credit for the following items:

Messenger fees paid.
Commission.
Mileage, if any (as shown by mileage settlement).

SPECIAL COMMITTEE.—We recommend the appointment of a special committee, consisting of three, one of whom shall be a chairman, to whom all differences of opinion between connecting companies, relative to division of tariff, mileage allowances, etc., may be referred. This committee to act in an advisory capacity only.

COLUMBIA TELEPHONE MANAGER REPLIES TO HUME

IN reply to a recent interview concerning Chancellor Allison's decision in the matter of the Cumberland Telephone & Telegraph Company's standing in the State of Tennessee, made with Leland Hume, assistant general manager of the Cumberland Telephone & Telegraph Company, Dr. O. J. Porter, general superintendent and manager of the Citizens' Telephone Company of Columbia, Tenn., has written a letter in which he gives a history of his company and tells of the persistent efforts to destroy it made by the Cumberland Telephone & Telegraph Company. He says in part:

"When it was seen by the Cumberland Telephone & Telegraph Company's officers that the Citizens' Telephone Company in Columbia was likely to be a success, the Cumberland Telephone & Telegraph Company sent out an emissary, who made a house-to-house canvass, not only with the citizens of Columbia, but with the people throughout the county, and cut the rates to 50 cents per month for residences, not only in the town, but to citizens in the county, to whose houses they would have to erect telephone lines to supply the services. The emissary in many instances offered to put the instrument in the house and did put instruments in houses without requiring any pay whatever. At the same time he avowed that it was the purpose of the Cumberland Telephone & Telegraph Company to break down and crush out its weaker rival in Columbia, and that after they had done so the former rates would be restored.

"With respect to the statement made by Mr. Hume in his interview that our company had been going on from bad to worse, I beg to state that our condition has been improving steadily in every particular, our service is first-rate, and is better than that of the Cumberland Company. Our company is out of debt and is giving universal satisfaction to its patrons. It has more subscribers than ever before and is steadily increasing its list.

Digitized by Google

"With respect to Mr. Hume's statement that propositions of an official character had been made to him in his capacity of general manager of the Cumberland Company to buy out the Maury county concern, I beg to state that this statement is totally without foundation whatever.

"Some two or three years after the bill had been filed in Nashville to oust the Cumberland Company from the exercising of franchises in the State, a written proposition was submitted by the Cumberland Company to the Citizens' Company to buy out our plant in Maury county, and give us more favorable rates, provided the suit pending at Nashville and recently decided should be dismissed. When it was known that this proposition had been made several hundred of the stockholders of the Citizens' Telephone Company assembled in the Opera House at Columbia, while Mr. Hume was at the Bethell House, nearby, awaiting the result of his proposition.

"When it was stated to this meeting of the stockholders of our company that a written proposition had been submitted by the Cumberland Company to buy out our company and its properties, the stockholders unanimously declared that they would not permit the proposition even to be read before the stockholders, and that they would not entertain any proposition to sell out to the Cumberland Company at any price or upon any terms whatever.

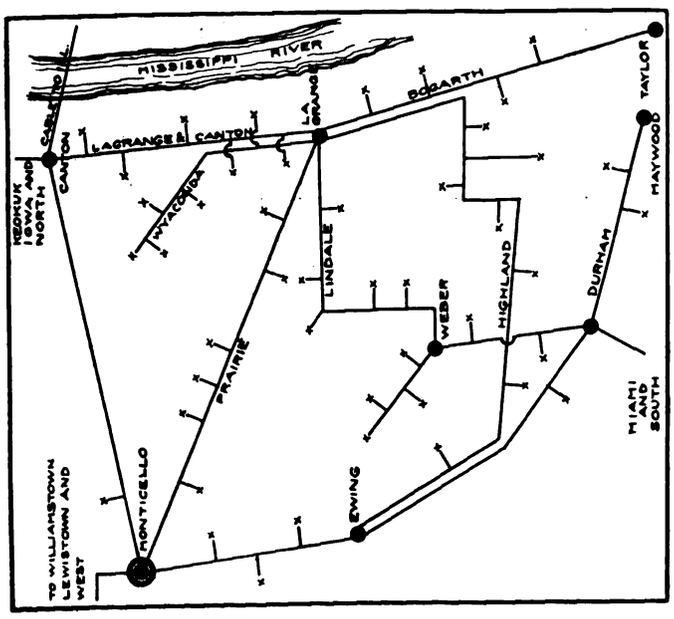
"With respect to Mr. Hume's statement that the last of the propositions was made only a few weeks ago and was bona fide, I beg to state that Mr. Hume came to Columbia and sent me word that he desired an interview with me. I sent word to him that if he desired to see me he would have to come to my office. When he reached my office he wanted to know if our company would make him a proposition to sell out our Maury county plant to the Cumberland Telephone & Telegraph Company. I told him that we would not do so, and he thereupon requested me to say nothing about this interview with me. I respected his request and did not say anything until he had perverted the facts.

"Mr. Hume states that our company makes frequent assessments on its shareholders. This is untrue."

TELEPHONE MAPS

By W. H. Elges.

THE use of maps and diagrams has been general in every engineering undertaking, and their value as a means for determining routes and methods of operations has been considered of the highest importance. It is therefore to be regretted that in the average telephone company their use has not been general, for nowhere is a more definite knowledge of a system required than in the details of a telephone system. Telephone companies that are growing fast, even if they have had maps of the territory that was originally covered, very often fail to keep them up-to-date, and consequently when a trouble occurs which it is necessary to clear quickly, a lineman is sent out to go over the line and often wastes much time before the fault is discovered. When a change is made in the management and a new man comes to take hold of the business, he is at sea as far as the



Map of Citizens' Telephone System, Lewis County, Mo.

routes of the different wires are concerned and it takes him some time to get acquainted with them, whereas if there was an up-to-date map in the office showing all the circuits, subscribers, and trunks, he would have no difficulty in getting posted upon the subject. Again, in many rural communities, a subscriber may call for another, simply giving the locality of a telephone without the number. If the manager has a map he can tell right away what the number is or how to go about making a connection. The accompanying diagram shows a map of the lines owned and operated by the Citizens' Telephone Company, of North Missouri, in Lewis County. The circuits shown are only country lines, and crosses indicate subscribers. If necessary, the names of the subscribers, together with their telephone numbers, could be marked upon the map. From the diagram it can be seen that Canton is directly connected with La Grange and Monticello, and direct lines run from Monticello to La Grange and Ewing. Other circuits can be readily traced out.

For the use of repair men, a map should be prepared showing through whose property and over what roads the lines run, and any other information should be given which would be of value in clearing trouble. Some large companies have expanded upon the map idea and have route books which show the poles and cross arms, and also indicate the pins upon which each circuit is mounted. In this way it is quite easy to construct a new line or to change over old ones to accommodate a new subscriber in a much quicker manner than would be possible without.

It is also very important that the poles where transpositions take place should be marked, because in building new lines the relation which the new line will bear to the old line so that it shall be free from inductive effects, depends entirely upon the position of the transpositions. In designing maps to cover certain territories, it is advisable to subdivide the service, so that whereas one map will give a general outline of the system, other maps will specify the distance of toll lines, and still others the subscribers within certain limits. All maps should be drawn to scale, otherwise their value is very much reduced; since it is evident that in locating a trouble upon a certain line, if there is a possible place where such a trouble might occur and the resistance test shows that this location is not the one where the trouble that is being looked for occurs, a great deal of time may be saved. Special note should be made of street railway and electric light circuits, and these should be kept up-to-date, so that as new telephone circuits are constructed the exact route may be mapped out before hand, so as to secure maximum efficiency out of the system without any of the faults due to hasty construction.

It has not been the purpose of the writer to deal with the theoretical advantage and practicability of maps, but to outline in a general manner what he considers to be the reasons for their usage and the best methods for applying them. It is evident that conditions will arise which will make a change in the general idea necessary, but, on the whole, the principle upon which the work is to be done is the same.

LONG DISTANCE TOLL-ACCOUNTING.

ARTICLE I.

By C. L. Norton. *General Toll Accountant, United States Telephone Co., of Ohio.*

THE Independent telephone field demands a system for toll accounting that is simple in operation, yet accurate in detail. An important feature to a long-distance company is the prompt report to its main office of business transmitted over its lines. The returns should be in such order that the clerical work of checking for deficiencies can be accomplished in the least time.

A long-distance company may have connection with hundreds of local exchanges, and each local company must be furnished with a uniform set of instructions for handling and accounting that must render information, yet void of complication.

Every message that is transmitted must be recorded. The most feasible record is a toll message slip. Care must be exercised that the originating and terminating operators make a full record of each call. The omission of any item of information often causes irreparable harm, and the loss of a call for want of convincing data on a disputed message.

C. L. Norton.

On Jan. 1, 1904, a complete set of rules and instructions for the handling and accounting of long-distance tolls was inaugurated for the use of all local exchanges connected with the United States Telephone Company.

A local company with a supply of toll tickets, both sent and

received, a toll ledger and a monthly toll report can make out a very complete report by following the instructions outlined.

Rules and Instructions.

Toll Tickets: Every message sent or received must be recorded on a toll ticket, great care being exercised that the originating and terminating operators check messages accurately and in harmony with the Routing and Tariff books. Spaces are provided on the toll tickets for full information necessary for recording each call. In each case every call is to have the full information, special attention being directed to "overtime," which must, in all cases, be charged and reported.

Tolls Sent Paid: Represents calls originating at a station, the charges of which are to be collected at the station forwarding same. These calls are reported on a white "sent" ticket, Fig. 1.

Tolls Received Paid: Represents calls terminating at a station, the charges of which have been paid and collected at the forwarding point. As much care is to be taken in recording these messages properly as of "sent" calls; otherwise false charges or credits will be created for or against a forwarding point. These calls are recorded on a pink "received" ticket, Fig. 2.

Reversed Messages: For the convenience of the public charges on originating tolls are permitted to be reversed to the receiving point. Necessary notations must be made on tickets representing this class of service, so that they may be distinguished from a regular call. Reversed messages are either "tolls sent collect" or "tolls received collect."

Tolls Sent Collect: Represents calls originating at a station, the charges of which are to be collected by the station receiving same. Great care must be shown in having a thorough understanding with the receiving point that the reversing of such charges are permissible, and that the collection of these tolls will be made. These calls are recorded on a "sent" ticket.

Tolls Received Collect: Represents calls terminating at a station, the charges of which are reversed and are to be collected by the agent at the receiving point. Necessary precaution is to be used so that the possibility of such calls becoming uncollectible is removed. These calls are recorded on a "received" ticket.

Messenger Fees Paid: This fee represents the necessary expense involved in obtaining patrons that are called on received messages. Before paying such fees the terminating station must ascertain to a certainty from the forwarding station that the amount will be paid; otherwise no credit will be allowed. Reversed messenger fee charges are absolutely prohibited. All such charges must be collected at the forwarding station.

Messenger Fees Collected: Represent the fees collected by a station and charged on originating calls in addition to the regular tariff. The utmost care must be used that the amount collected corresponds with the fee asked by the terminating station.

Charges for Messenger Service: Special attention is directed toward reducing messenger fee charges to a minimum, as in many cases excess charges of this nature have created a prohibitory rate for long-distance service.

Fig. 3.

(D) Tolls Received Collect.—This column is to include the amount of services explained as "tolls received collect."

(E) Messenger Fees Paid.—This column is to include the amount of all fees as per explanation of "messenger fees paid."

MONTHLY TOLL REPORT: The total of each station's monthly toll business is to be carried forward on the monthly report, Fig. 4. The stations are to be arranged in alphabetical order, taking care that all tolls, messenger fees, etc., are included in the columns designated for each individual service. The totals are then to be obtained for the monthly settlement.

BALANCE SHEET: The reversed side of the monthly toll report represents the monthly balance sheet, or settlement, and is divided into debits and credits, as shown in Fig. 5.

DEBITS:

(A) Balance Due U. S. T. Co. From Last Month.—Any balance due from the previous month, with the exception of check errors, is to be debited after this notation.

(B) Tolls sent paid.

(C) Tolls received collect.

(D) Messenger fees collected.

These three items represent the tolls and messenger service paid and collected at a station, and are known as "tolls collectible." The total of these three items must agree with the amount of the monthly toll bills.

(E) Check Errors.—In debiting check errors, give the month in which the errors occurred, together with the name of the station with which such omissions were made.

CREDITS:

(A) Balance Due Office From Last Month.—Any balance that is due an agent from a previous month is to be shown after this notation.

(B) Messenger Fees Paid.—After the necessary assurance is obtained that the amount of this service is correct, credit may be taken on the monthly toll report

(C) Commission.—A station is entitled to commission, only, on originating business which consists of "tolls sent paid" and "tolls sent collect," with the limit that the commission on any one message of three minutes' duration is not to exceed 12½ cents.

REIMBURSEMENTS: No credit is to be taken on the toll report other than specified in this circular, and further reimbursements can only be obtained by sending an authorized bill to the general manager's office, and if correct a check will be returned covering same.

TIME: A monthly toll report must be mailed to the general toll accountant on or before the 10th day of each month covering the preceding month's toll business. A check for the cash balance shown on the monthly toll report must accompany the report in every instance. Remit by post office order, express money order, check or draft.

These instructions bring the reports to the general office.

PLANS FOR SIOUX CITY EXCHANGE.

THE plans for the exchange building to be erected by the Sioux City, Iowa Telephone company are about completed. The estimated cost of the building is $25,000.

According to the plans and specifications the new exchange building is to be one of the very best of its kind. It will be as absolutely fireproof as it is possible to make buildings. The architects say that the only way fire can get into the building is through the front door. The building is to be of Portland cement, concrete construction. The framing will be of steel beams and columns, supporting concrete floors with thin surfaces of wood or ornamental tile flooring. The walls will be of hollow cement blocks with facing on the front elevation of ornamental brick and terra cotta. The base will be of cut stone.

The structure will be two stories in height, with a high basement, and will be of the French renaissance style of architecture. The first floor will contain the business offices of the company, the manager's office, the toll booths and a meeting room for the board of directors of the company and the necessary cloak rooms.

The second floor will contain the automatic switchboards and accessory machinery, an allowance being made for the accommodation of 7,000 subscribers. Provision will be made for an additional 3,000 subscribers on the first floor, so that the entire capacity of the exchange will be 10,000 subscribers. The arrangement of the switchboard will necessitate the placing of three continuous skylights the full length of the building, affording solely north light. The switchboard alone of the automatic variety, will cost $65,000.

The basement, besides a steam heating plant, a room for storage batteries and a power plant, will contain space for storage and surplus. The ground dimensions of the building will be 80 by 45 feet.

OPPORTUNITIES OF THE PACIFIC COAST.

THE AMERICAN TELEPHONE JOURNAL is receiving many words of commendation and encouragement from Independent telephone operators who are successfully fighting the Bell monopoly in various parts of the country. Some of these letters are from men who are building up a large business in spite of fierce competition; others are from those not so able to successfully combat a great monopoly like the Bell, but who are "getting there" just the same.

A correspondent from Humboldt County, California, sends in addition some interesting facts relative to the field in his locality and the unusual opportunities it presents to Independents with ample financial backing. He makes an earnest plea for some one to go out there and take possession. The letter itself is worth reprinting; not only because of the really valuable information it gives to those who are seeking investment in the field of Independent telephony, but because it shows the stuff of which the men are made, who have been waging this great and winning fight against the Bell monopoly.

"We have one of the best fields for Independent telephone operation. With practically no thunder and lightning, no trees on street, no snow and sleet storms, cheap construction and maintenance, a rapidly increasing population, people exasperated and ready to revolt makes Humboldt County an ideal field for the Independent. This county has a greater area than the whole State of Connecticut, is situated in northern California with the only good harbor north of San Francisco for several hundred miles. The banner dairy and lumber section of the State, exceptional climate, neither hot nor cold, no snow and no irrigation needed. Geraniums and fuchsias grow and bloom in the open air the year around. Southern Pacific and Santa Fe are racing to get here. One city of 12,000 and another of 3,000, and many smaller towns. A grand opening for Independent telephone men. The whole coast has about 160,000, Bell and Independent. The Bell company has succeeded in keeping down all other companies in this county with one exception, and that exception is myself. With only five telephones, a few miles of wire and about one hundred dollars in coin in '92, I have increased the business unaided until I now have over 60 miles of wire and nearly 80 telephones, with orders galore. Now, if I can do that without capital or financial backing, what can others accomplish with the same spirit and a long sack to draw from? The Bell company has made me many flattering offers from the first, and until lately, when they gave me up as a bad job, so they have settled down to the old "scare" and "pinch out" game. Understand, I am not croaking. Wasn't built that way, but I would like to have some parties with capital and push come in and cover the other parts of the county. There is lots of room. I have only a small part of one end of the county, the larger and better part has not one Independent telephone. Eureka, with 12,000 population, is 12 miles from any of my telephones, claims about 1,400 telephones, and Arcata and vicinity, where I have a 50-year franchise, has nearly 150. That includes mine. Will gladly give any information to parties looking for a good field. Please understand I have nothing for sale, but will be only too glad to co-operate with any or all Independents."

"J. H. BLAKE,

"Box 229, Arcata, Humboldt Co., Cal."

A REPRESENTATIVE OF THE GREAT AND GLORIOUS COUNTRY.

We have heard much in the past of the "glorious climate of California" and the possibilities it offers to all who may come. But the effect of this climate on the telephone business is something which has not been sufficiently appreciated. Here is a county, just a mere county, larger than the entire State of Connecticut, into which Independents are so anxious to break. Here is a land that "flows with milk and honey," that is neither hot nor cold, in which the telephone girls can pick bouquets every day in the year. There are no trees to bother the wires, no snow and sleet to break down the wires, and better yet, no lightning to burn them out. Truly and in all seriousness, Humboldt County, California, presents an ideal opening for the Independent operator. Most of east and middle west have longed for the climate of California with a longing almost irresistible. They have seen great possibilities in the direction of fruit and comfort, but the idea of conducting a telephone exchange free from lightning and sleet and the thousand and one annoyances inseparable from the average climate seems like a vision of the promised land.

If California climate never did anything beyond developing such men as Mr. Blake, that would be much. A climate that will exhilarate a man to such a degree that he will embark in the telephone business in the face of Bell competition with five telephones and one hundred dollars in cash, is certainly not to be sneezed at. A climate that will produce such a man and give him strength of character and sturdy courage to successfully resist the blandishments and the open enmity of the relentless Bell monopoly is a climate which we should like to distribute around judiciously where it would do the most good.

THE AMERICAN TELEPHONE JOURNAL has made many references to the courage and ability of the men who have made the winning fight against Bell monopoly during the past decade, but no words of praise can speak louder than this simple statement of fact from one who surely knows whereof he speaks. This is the kind of stuff of which Independents are made. Such men as this have won the great central west away from the Bell and are getting a firm foothold even out on the Pacific coast.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

TERMINATION OF SERVICE CONTRACT—DAMAGES.

Our contracts for exchange service read that "in case the subscriber elects to terminate his contract before the same has expired he shall serve written notice upon the manager at any time upon the payment of rental and other charges earned in full to the date of surrender of equipment, and in addition one-half of the unearned rental for the balance of the term then existing." Can the subscriber be compelled to pay rental for one-half of the unexpired term as per contract, and if he refuses can we compel him, and what would be the method of procedure? Can he be compelled to pay for service, or in other words, can he consider that his service is discontinued before he has given the manager written notice, even though he has orally notified several other employees some days or weeks previously, it being stipulated in the contract that he is to give written notice? Please answer the above and any other suggestions which may come to your mind along this line, in the next issue of the JOURNAL.

THE above quoted provisions of your contract are perfectly binding and valid in law. When a party has made a contract and stipulated that it shall be terminated in writing, he can be held to it unless he takes the steps required by his agreement. You may therefore consider his contract as in force until you received the written notice in accordance with his contract and charge him for service until regularly notified of its termination. The relation existing between the company and the subscriber is that of landlord and tenant and the same law governs.

The subscriber may be compelled to pay rental for half of the unexpired term as per contract. The provision is really one for liquidated damages, the damages that the company would suffer from the breach of contract being uncertain in their nature and difficult of determination. The parties having agreed that the measure of damages shall be the rental for one-half of the unexpired term, the courts would accept their determination upon the subject. Your method of procedure to collect the rental for half the unexpired term would be by breach of contract.

SUBSEQUENT CONDITION OF WIRE NOT COMPETENT

THE Supreme Court of Appeals of West Virginia, in the case of Hannum vs. Hill, has held that in an action for personal injuries received by reason of the negligence of a telephone company in permitting its wire to be stretched so low down over the public highway as to be caught by a horse's feet in passing, it is not competent to prove the condition of the wire at that point months subsequent to the time of the injury complained of. The action was brought by W. H. Hannum against the Petersburg & Franklin Telephone Company, a partnership composed of various persons, and a judgment of $4,500 recovered. The case was reversed, not upon the point mentioned above, but on another point that is more technical than of interest to the telephone business.

Hannum v. Hill (W. Va.), 43 S. E. 223.

DYNAMITE IN POST-HOLES.

IN the case of Harp vs. Cumberland Telephone & Telegraph Company a judgment in favor of the defendant has been reversed by the Kentucky Court of Appeals. Plaintiff, who has been employed by defendant in setting telephone poles, was directed to complete the digging of a hole which had been partially dug by another employee who was present at the time, but failed to inform the plaintiff that unexploded dynamite, used in the work, had been left in the hole. The dynamite was concealed by mud and water which had collected in the hole, and plaintiff, without knowledge of its existence, commenced the work, and while engaged therein, was injured by an explosion. The court held that an instruction by the trial-judge to the jury, that plaintiff could not recover unless defendant or its agents in charge of the work knew, or by the exercise of ordinary care, could have known that unexploded dynamite remained in the hole, and failed to exercise such care, was erroneous since defendant's duty to furnish plaintiff with a reasonable safe place in which to work required it to know that there was dynamite in the hole, and to have removed it or warned plaintiff of the danger. The fact that the explosive was left in the hole by plaintiff's fellow-servant was held to be immaterial, since the presence of the dynamite rendered the hole an unsafe place for plaintiff to work. Harp vs. Cumberland Telephone Company (Ky.), 80 S. W., 510.

RESCUERS IN THE LAW.

POTTS AND WHITWORTH, employees of a telephone company, were engaged in stretching a line of that company upon its poles. In doing so, the line had to be passed above a span of an electric car system. Potts, upon the telephone pole, was holding one end of the wire, while Whitworth, upon the ground, was holding the other. Whitworth stumbled, and in doing so dropped his end of the wire, which fell to the ground, resting upon the span wire below, which, by reason of defective insulation in the hanger by which the trolley wire and the span wire were connected, was heavily charged with electricity. Potts, holding the other end of the wire, instantly received a shock, and fell head foremost, but his spurs caught on a spike on the telephone pole, and he hung suspended in the air, head downward, and was literally roasted to death. Whitworth ran to his relief, and, catching hold of the wire of his own company which he had been using, in a vain attempt to cut it was himself instantly killed. Mrs. Potts sued the electric railway company and recovered a judgment. Suit was then brought by the wife and daughter of Whitworth against the same company for damages. The defense of the company was that the deceased had been guilty of contributory negligence in attempting to save his friend.

The Supreme Court of Louisiana held that Whitworth, in going to the rescue of Potts, was not in fault, but was acting under a high sense of moral duty, and for his death while engaged in the performance of that duty, occasioned by the negligence of the electric railway company, it was responsible in damages. The court quoted with approval the following: "A rescuer—one who, from the most unselfish motives, prompted by the noblest impulsives that can impel man to deeds of heroism, faces deadly peril—ought not to hear from the law words of condemnation of his bravery because he rushed into danger to snatch from it the life of a fellow creature imperiled by the negligence of another. He would rather listen to words of approval, unless regretfully withheld on account of the unmistakable evidence of his rashness and imprudence. This, conscience and reason approve, and the best judgment of thoughtful and intelligent judges has declared it to be the law of the land." Whitworth v. Shreveport Belt Railway Co. (112 La.), 36 S. 414.

KNOWLEDGE BY SERVANT OF LIVE WIRES.

THAT an employee knew that there were live wires where he had to work does not affect his right to recover for an injury by one of them, where he was informed by his employer that they were safely insulated, and where he had no knowledge that one of them by which he was injured was not so insulated. What the proximate cause of the injury was, was held to be a question for the jury. Haworth v. Mineral Belt Telephone Co. (Mo.), 79 S. W., 727.

IN THE OPERATING FIELD.

OPENING OF THE SALT LAKE CITY EXCHANGE.

THE new exchange of the Utah Independent Telephone Company at Salt Lake City, was thrown open for a reception and inspection previous to its opening for business, and some 4,500 persons took advantage of the opportunity to inspect the building and apparatus.

The entrance to the building was brilliantly illuminated with gas and electric lights and the interior was decorated with palms and ivy, with large bouquets of carnations on every mantel and desk. The color of the electric lights added to the decorations.

On the reception committee were Governor and Mrs. Wells, Mr. and Mrs. S. F. Fenton, Mr. and Mrs. N. W. Clayton, and several other people of social and financial distinction in Salt Lake City. The City Council attended the reception *en masse*. The visitors were escorted over the building and had the various appliances explained to them by Manager C. O. Harris.

The exchange opened for business on July 5th. This plant is one of the largest Independent systems in the West, and it is expected the number of subscribers will be far in excess of those of the Bell Company within a short while. The switchboard has an ultimate capacity of 12,600 lines of which 4,000 are at present equipped, and is of the latest Stromberg-Carlson central energy type.

THE CUMBERLAND AGAIN IN TROUBLE.

AT a recent meeting of the Louisville Fiscal Court the Cumberland Telephone & Telegraph Company was made the subject of a sharp resolution by this body which was adopted. When the question of paying a quarterly bill for certain service was called up Magistrate Shadburn said he wished to register an objection to the character of service rendered the county. He stated that the county's contract called for single or individual lines in every county institution, and at the residence of every county patrolman. However, he declared, many of these were party lines. He stated further that he had much difficulty in getting connection with these patrolmen when he wanted them, and offered a resolution that the individual lines be supplied or the company called upon to remove the party lines, which, it is claimed, should be replaced. Magistrate Velten amended the resolution so as to require the telephone company to remove its service from all county institutions inside and outside the city limits, including the courthouse, unless the objectionable party lines were removed. The resolution as amended passed without dissent.

SOME TWIN CITY FACTS.

THE Twin City Telephone Company, which operates in the State of Minnesota and the two Dakotas, is a reorganization of the old Mississippi Valley Company. Under the presidency of Mr. Moulton, the company has made wonderful improvements; beginning with 300 it now has 12,000 subscribers, which are increasing at the rate of nearly 3,000 a year. The gross receipts are approximately $410,000, which is sufficient to pay all expenses of operation, maintenance and depreciation, leaving a net surplus of enough to pay 6 per cent. dividend on the common stock.

About a year ago the same interests which own the Twin City Company, organized the Tri-State Company to build long distance lines in Minnesota and the two Dakotas.

In order to insure a close affiliation between the two companies, the Tri-State company bought one million dollars of the stock of the Twin City company. This not only insures a unification of the two companies, but the earnings of the Twin City company which now belong to the Tri-State company insure the latter company an income sufficient to pay a dividend on its common stock. In addition to this income from the Twin City earnings, there are also the earnings from the long distance lines, which will exceed those from the Twin City holdings. With new lines of the very best construction, reaching to every principal point in the State, the Tri-State company will take a position in the very foremost ranks of long distance companies in the United States. It is their intention to make their service so good and at such a reasonable price, that busines men throughout the northwest will find it cheaper to transact their business over the long distance lines of this company, than by any other agency.

The trunk lines owned by the Tri-State company and allied companies are as follows: From Minneapolis to Duluth 150 miles, branches of the same 100 miles. St. Paul to La Crosse being built, 130 miles; St. Paul, to Austin, 110 miles; St. Paul to Windom, 175 miles; Minneapolis to Grand Forks, being built, 400 miles, a total of 1,065 miles. All this except the branches of the line to Duluth is standard copper circuit construction of the very finest description.

BELL COMPANIES REVOLT.

THE Bryant and Geneva (Ind.) telephone companies, tired of isolation, have decided to abandon the Bell Company's toll lines, and after the first of August will be connected up with the Independent lines. This gives them connection with the Home Telephone Company's system in Portland, Ind., which was an end much desired by all concerned. As it was, Bryant and Geneva were the only Bell exchanges of any consequence in this part of the State, and whenever one of their patrons desired to talk to Portland, Decatur, Berne or any other point within a radius of 100 miles, he was compelled to pay a messenger fee besides having to wait indefinitely for the party to be located.

The patrons of the two systems have gained great advantage in thus getting connection with so many great Independent systems.

OKLAHOMA TELEPHONE ASSESSMENTS.

TELEPHONE companies have been divided into four classes for the purpose of assessment. Companies in the first class are assessed $30 per mile for the first wire and $5 for each additional wire. The second class rate is $25 for the first wire and $5 for each additional wire. The third class assessment is $20 for the first wire and $5 for each additional wire and the fourth class is rated at $15 for the first wire and $5 for each additonal wire.

THE USE OF THE COUNTRY TELEPHONE.

THE telephone in the country districts is proving itself a great aid to the traveling salesman. Where formerly it was necessary for him to travel from 10 to 40 miles to secure an order, now, by means of the local telephone, he can reach his party and find out whether there is any need of him to take the journey or perhaps be able to make a sale.

The extent of rural lines now in operation is so great that there is hardly a town or village in the country of any size that has not got communication with another by means of Independent lines. Farmers realize its value and perhaps appreciate it more than do city people, from the fact of isolation.

We hear from time to time of happenings in which the telephone has been the main factor, and its general use is becoming more and more apparent as people realize its time and labor saving value. The praise for this state of affairs is due entirely to the Independent movement, as before its advent into the field the Bell companies did not seem to care whether a country party

Digitized by Google

had a telephone or not, and even if one was contracted for, it was at rates way beyond its value to the party subscribing, since the number of people he was able to reach was limited to a very small number.

HUMBOLDT COUNTY (CAL.) SYSTEM.

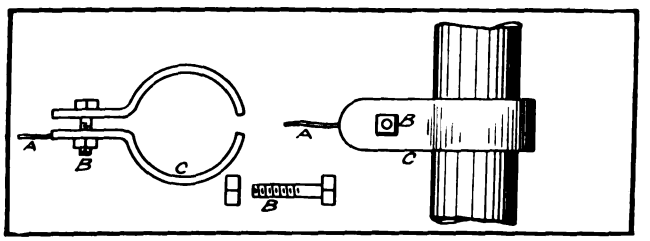
HUMBOLDT COUNTY, Cal., is rapidly coming to the front in the Independent field. The Blake telephone system, owned and operated by Mr. J. H. Blake, is one of the many progressive companies which have made the word Independent synonymous with good service and reasonable rates. Included in the territory this system covers are the towns of Arcata, Redwood, Alliance, Glendale, Blue Lake, besides several smaller places through which the lines pass to reach the outlying subscriber. The highest grade of construction and apparatus has been used,

EXTENSIONS OF TRI-STATE.

THE Tri-State Telephone Company, of Minnesota, has been actively engaged this year in building and extending its system. Recent arrangements have been made whereby it secures connection with the Winona Telephone Company, and the work on this new branch will be completed within a short while. Lines will also be built to La Crosse and Austin which will give connection to many towns along the Minnesota Southern Railway. A line is also to be built from Winona to Rochester, Owatonna, and Mankato, which will connect with Worthington, Windon, and give through connection with Sioux Falls, S. D.

GROUND CONNECTIONS.

GREAT difficulty is often experienced in making satisfactory ground connections to pipes. This is especially true where the wire is wrapped around, as it is often impossible to solder it. The following idea is suggested as a means to overcome this difficulty: The diagram is self-explanatory. The only suggestions that are necessary is that the pipe should be thor-



oughly cleaned and made as bright as possible before the brass clips are put on. The nuts and screws which come with dry batteries could be used when the battery is worn out for the purpose of fastening the clamps to the pipe.

Another excellent feature of this method of clamping is that it can be readily removed for cleaning at any time if necessary.

TELEPHONE EXTENSION IN THE NORTHWEST.

COMMUNICATION was formerly opened with Vashon Island, Washington, over the Skagit Farmers' Mutual Telephone Company's cable connecting Vashon Island with Seattle at the exchange of the Independent Telephone Company recently. Mayor Ballinger and a score of business men gathered at the Independent office in this city, while forty-five leading residents of the island congregated at the Vashon terminus to witness the opening of the new line.

The cable is four miles in length and extends from Brace's point on the mainland to Dolphin's point, on the northern end of Vashon Island. In addition to the office at Vashon, offices will be established at Lizabula, Aquarium and Burton.

A LARGE INDEPENDENT DIRECTORY.

GEORGE BLANDY, president of the Hawkeye Telephone Company, Des Moines, Iowa, is preparing to issue a telephone directory which will be out this fall and will be distributed to patrons of the Mutual Exchange, giving about 2,000 farm line addresses within a radius of 30 miles of Des Moines. Of these about 200 will be Polk County addresses.

The new directory will be of subscribers of the Hawkeye and of such other Independent companies in the Des Moines territory as have toll privileges with the Mutual. It is expected that before the issuance of the directory a schedule of cheap tolls for interchange of business between the patrons of the Mutual and the farm lines will be arranged.

THE LAW AND THE TELEPHONE.

AS a means to aid the law the telephone is rapidly coming to the front. Down in the State of Texas a safe was broken open and $900 stolen. There happened to be a bridging telephone in the place. The robbers were not evidently acqainted with the difference between a bridging and series instrument, for they cut one of the wires on the road. When the robbery was discovered the telephone was still operative in the other direction, and a party was communicated with in a town thirty miles away, where, fortunately for the people who had been robbed, the robbers went to catch a train. The party that was called up in this town happened to be standing on the platform, and was talking to an officer about the robbery when some men came up. The man told the officer they were strangers and told him to arrest them. It turned out that they were the robbers, and through the aid of the telephone they were convicted and sentenced two years.

THE MEINEMA SELECTIVE RINGING LOCKOUT TELEPHONE SYSTEM.

A SUBSTATION set to provide a selective lockout party line telephone, bearing the above name, was recently noticed in our patent columns. This device is now reported to be upon the market. Selection is accomplished by means of a step by step mechanism that is operated by a relay or electromagnet controlled by current pulsations which may be sent from any central source. The relay is carefully designed and constructed of the best material; while the step by step mechanism is made of hardened steel to insure long wear, all contact springs of German silver and provided with platinum tips for the actual contacts. A peculiarity of this system lies in the fact that only the ringing circuit is arranged to be selected, and ringing is accomplished over one side of the line and ground. Normally any telephone can be cut into the line by the mere act of removing the receiver; but when any line is in use, the line contacts of all the other telephones are thrown out of gear in such a manner that it is impractical to close the circuits of either the receiver or the transmitter, and by this means the device provides a secret system as well as one which is selective.

THE CUYAHOGA DEVELOPING.

THE Cuyahago opened its exchange for inspection and large numbers of Cleveland people took advantage of the opportunity to inspect the new equipment. This company is now giving splendid service and is securing new contracts at the rate of 250 a week.

The earning statement for June has not yet been completed, but it is thought that it will show a gain in gross earnings over May of $1,000. The May statement showed a gain over April of $1,200. The showing for June would have been much better but the company was handicapped for equipment for a week or so and was not able to keep up with the orders for new telephones. There is plenty of new equipment on hand now, however, and the new work is going on rapidly.

A TELEPHONE TANGLE.

"ARE you there?" Yes!"
"Who are you, please?" "Watt!"
"What is your name, please?" "Watt's my name!"
"Yes; what is your name?" "I say my name is Watt!"
"Oh! Well, I'm coming to see you this afternoon." "All right. Are you Jones?" "No; I'm Knott."
"Who are you then, please?" "I'm Knott!"
"Won't you tell me your name, please?" "Will Knott!"
"Why won't you?" "I say my name is William Knott."
"Oh, I beg your pardon."
"Then you'll be in if I come around this afternoon, Watt?" "Certainly, Knott."
They were rung off by the exchange. Now, what Knott wants to know is whether Watt will be in or not.

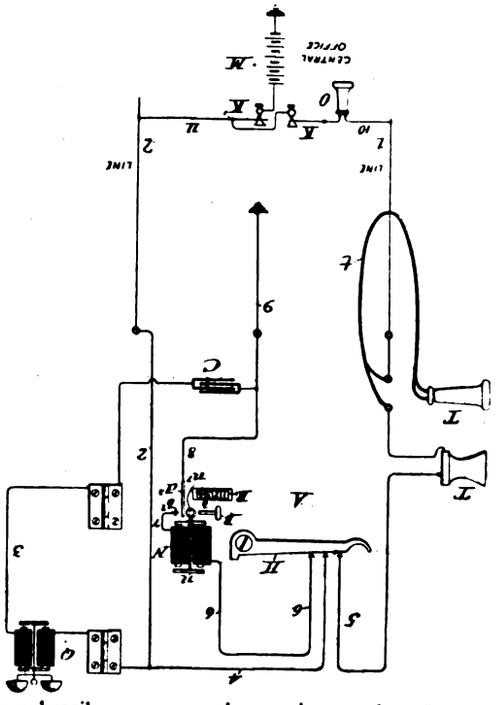
TELEPHONE PATENTS

IMPROVED CALL-REGISTER FOR TELEPHONE EXCHANGES.

J. W. Lattig, of West Bethlehem, and C. L. Goodrum, of Philadelphia, patent (No. 763,911) and assign to the Eastern Tel. Mfg. Co. of Westchester an improved telephone register, the essential features of which are shown in Fig. 1, which is a conventional diagram of the circuit. The central office is shown at *M*, while the subscriber's station is equipped with the transmitter *T* and the receiver *T'*, condenser *C* and call bell *Q* in the usual manner. The essential features consist in an electromagnet *N*, a push button *B* and a register *R* and a contact device *F* of the lever *D3* and a contact piece *D2*. When a call is to be



made the subscriber removes the receiver and pushes the button *B* which is under control of the electromagnet *M*. The operator is notified by the lighting of the calling lamp in the usual manner. She takes the order and obtains the desired party. When the desired party answers the operator presses the key *K'*, which sends current through the electromagnet *M*, releases the button *B*, which by means of a spring returns to its normal position, and returns by means of its backward motion. The plunger *B* rings the operator and at the same time operates the register *R;* thus a call is recorded and by the sound of the bell the operator is informed that a record has been made. The operator then completes the connection in the usual manner.

TRANSMITTER ARM.

H. J. Guttman, Chicago, Ill., patents (No. 761,671) an improved transmitter arm. The object of this device is to provide a transmitter arm made of pressed metal upon the end of which a cup, or proper receptacle can be formed into which the working parts of the transmitter may be placed.

COMBINED RECEIVER AND TRANSMITTER.

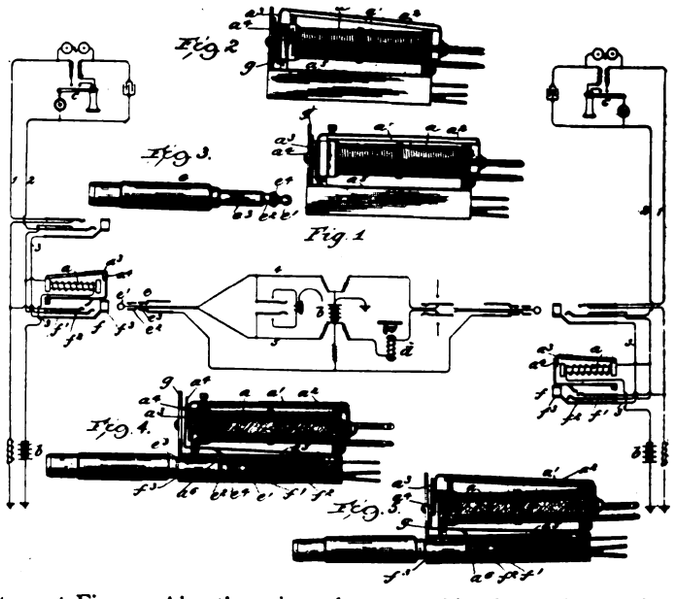
J. Gunnar Holmström, of Stockholm, Sweden, patents (No. 763,755) an improved combined transmitter and receiver, and assigns to Elektromilitára Aktiebolaget, of Stockholm, Sweden. In combination instruments difficulty has been experienced in the fact that the vibrations of the receiver diaphragm would be communicated to the transmitter diaphragm. In Mr. Holmström's device the respective diaphragms are separated by a cavity which is packed full of a substance which is a non-conductor of sound, such as mineral wool, felt, etc., and by this means one diaphragm is prevented from influencing another.

IMPROVED TELEPHONE RECEIVER.

James I. Gemmill, of Cleveland, Ohio, patents (No. 759,095), an improved telephone receiver. The object of this invention is to produce a receiver which is cheaper to manufacture and more durable in operation. The essential features consist in forming a bowl-shaped brass cup, to which both the pole pieces and the magnet of the receiver are bolted, and upon the face of which the diaphragm is placed.

SWITCHBOARD CIRCUIT.

Patent (No. 762,336) is granted to F. R. McBerty, of Evanston, and J. L. McQuarrie, of Chicago, and assigned to the Western Electric Company. This patent describes a self-restoring signal designed to operate both as a line signal and as a supervisory signal. This is shown in Figs. 2 to 5, inclusive, while the circuit is given in Fig. 1. An eltcromagnet, *a*, is drawn downwards. is pivoted an armature, *a'*. The front of this armature is bent downwards and forms the target, *a3*. Normally this target is above an opal in the plate, *g*, and is consequently concealed. If the magnet, *a*, is excited the armature, *a'*, is drawn downwards. Directly beneath the electromagnet is a line jack as shown in sec-



tion at Fig. 4. Also there is a plate, *a4*, which is so pivoted that when the plug is inserted this plate is caused to rise in front of the target. The plate, *a4*, is painted the same color as the plate *g*, and, consequently, the insertion of the plug causes the signal to disappear even though the magnet remains excited. When the receiver is replaced upon its hook the magnet, *a*, is de-energized, the armature, *a'*, then rises and takes a position in front of holes which are cut in the plate, *a4*. Thus the signal reappears and can be used both as a line signal and supervisory signal. The circuit of Fig. 1 indicates the method of installing a system of this kind in a switchboard and presents an exceedingly simple circuit.

TELEPHONIC MICROPHONE ATTACHMENT.

C. H. Viggars, of Milton, Mass., patents (No. 763,575) and assigns to Charles Bate, of Brockville, Canada, an improved device for collecting sound to be attached to a telephone transmitter. The inventor provides a transmitter to which a receiver may be attached by means of a cord and plug, and to the transmitter a large funnel-shaped arrangement is attached whereby the sound waves which are spoken toward the transmitter may be collected and caused to impinge on its diaphragm.

Digitized by Google

QUERIES

Questions on any subject relating to telephony will be answered on this page.

POLE LINE.—(374.)

To save a long pole line we started to build across a marsh, but found out that we could not secure a solid line. Can you tell us if we can build a line through marshy ground and how. J. TEL. Co.

The most approved method of construction for conditions such as you mention is illustrated in Fig. 374. The earth should be excavated for about five feet deep, and planks about five feet long should be placed in the bottom of the hole, to make a flooring about four feet wide, then a log should be laid cross wise and

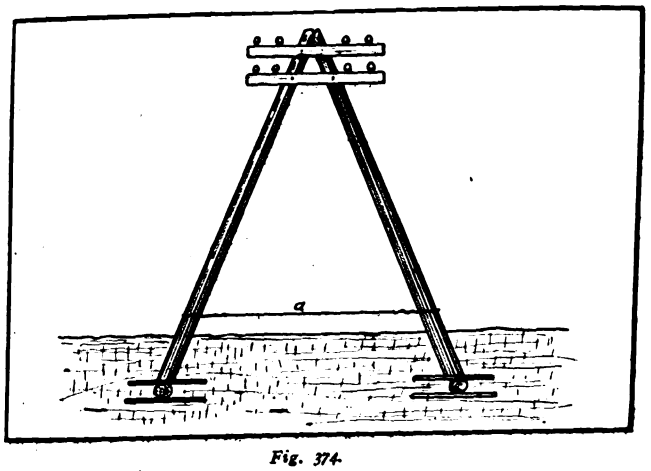


Fig. 374.

spiked to the planks. The space on either side to be filled with broken stones. Over this other planks should be placed and fastened to the log. The poles should be securely nailed to the cross pieces as well as to the log. On the top of the planks more stone should be placed. The two poles should be fastened with a tie wire, as at *A*, so that there will be as much resistance to a lateral movement as possible. In marshy ground, where there is any liability of the ground being inundated, this is the best method whereby the line can be securely protected and amply repays its additional cost in security

COMBINATION KEY.—(375.)

Will you please tell me whose make of key this is, and whether it is intended for both listening and ringing? A. C.

The key you illustrate, Fig. 375, is made by the American Electric Company and is a combined ringing and listening key. For

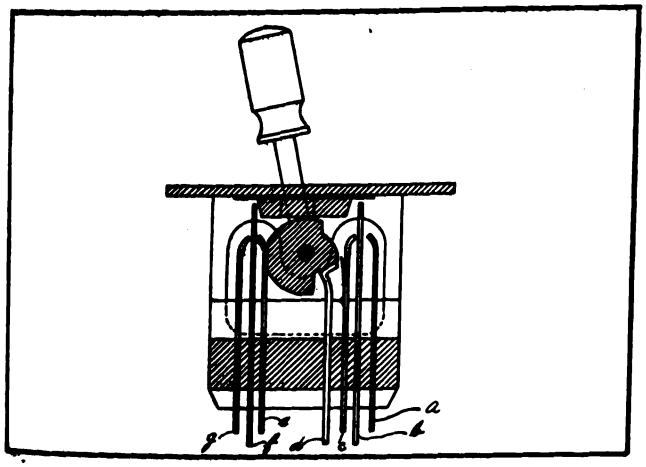

Fig. 375.

ease in illustrating we have only shown one side of the key, which represents one side of the circuit from tip to tip.

G and *a* are the ringing springs; *f* and *b* are the cord circuit springs being normally in contact with *e* and *c* which are strapped together. One side of the operator's set is connected to *d*, the other side not being shown. The hard rubber block underneath the face plate controls the ringing by opening the contacts of the cord springs from the connecting springs and closing them with the ringing springs according to which way the key is pulled. It is evident that ringing can be done both ways.

In listening the key is pulled part of the way, and to call it is pulled as far back as possible; to ring back it is pushed in the opposite direction.

LIGHTNING PROTECTION.—(376.)

We have experienced considerable trouble on account of subscribers on long bridged ground lines placing plugs on their telephones grounding same as a protection against lightning. Of course, this practice protects the telephone from damage, but subscribers frequently neglect to take the plug out when the storm is over, and one ground left on any telephone on a bridged line ruins the entire line until it is removed. We have equipped some of our bridged lines as per diagram enclosed. This arrangement of opening the wire with a knife switch certainly protects the telephone, and if a subscriber neglects to close the switch no other telephone is effected. We bring the ground wire from the telephone within a half inch of the knife switch and peel the insulation where the wire runs opposite to the switch. Do you consider this a safe practice? If not, state what objections. The switch is always placed on the eaves of the porch. W. T. C.

The method of wiring which you show does not embrace any protective device and so exposes the building to all the dangers

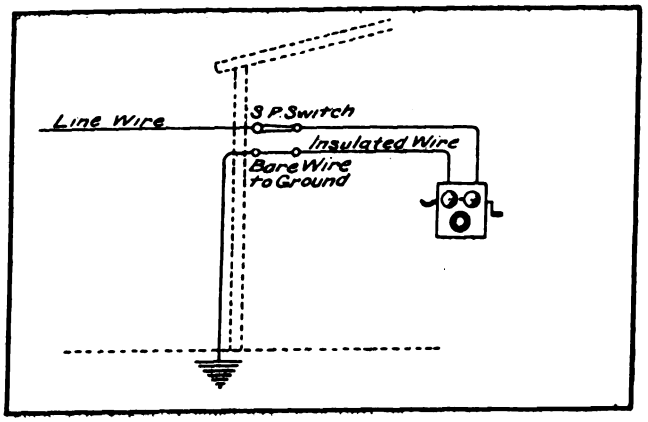

Fig. 376.

of unprotected wiring. We should consider it better general practice to equip the line with a good type of protecting device which would be more efficient in preventing injury from lightning, and would not be open to the objection of interruption due to carelessness on the part of the subscriber.

OHMMETER QUESTIONS.—(377.)

Will you please answer the following questions in regard to the home-made ohmmeter? How can a megohm be measured with it? How much battery voltage is needed with a galvanometer on a home-made ohmmeter, and will a special kind of galvanometer be required? J. T.

In answer to your first question a megohm can be measured with the ohmmeter in the same manner as any other resistance, although the instrument described was not intended to measure resistances at large and, consequently, when a high resistance is measured there is a probability of making a correspondingly greater error. The amount of battery which is desirable to use with the ohmmeter will depend upon the resistance to be measured. Low potential should be used with low resistance and high potential with high resistance.

CELL VOLTAGE.—(378.)

Why cannot more than two or two and one-half volts be obtained from a battery? N. R.

The reason why more than 2½ volts cannot be obtained from a battery is one of the inscrutable mysteries of nature, the reasons for which are unknown.

THE WEEK'S MESSAGES

FINANCIAL.

CHAMPAIGN, ILL.—The Home Telephone Company has increased its capital stock from $25,000 to $100,000.

PITTSFIELD, ILL.—The Pike County Telephone Company has increased its capital from $50,000 to $75,000.

TUSCOLA, ILL.—The Tuscola Telephone Company has increased its capitalization from $5,000 to $10,000.

MAUCKPORT, IND.—The Eureka Telephone Company of Mauckport has increased its capital stock from $10,000 to $25,000.

AFTON, IA.—By a unanimous vote of the stockholders of the Afton Mutual Telephone Company, the capital stock has been increased from $12,000 to $25,000. The officers are: O. B. Emerson, president; J. W. Coen, secretary.

CLINTON, IA.—The Tri-City Telephone Company, of Clinton, has filed a deed of trust for $80,000 given to the American Trust and Savings Bank of Chicago, and Frank A. Jones, trustees.

ALMA, MICH.—The stockholders of the Union Telephone Company have authorized the Board of Directors by a vote of 99 per cent. to increase the capital stock of the company from $400,000 to $500,000. Of this amount $50,000 becomes immediately available for enlarging the company's exchanges and extending the toll lines.

NEW YORK, N. Y.—The Hudson River Telephone Company has declared its regular quarterly dividend of 1½ per cent.

TIPPECANOE CITY, O.—The Tipp Interurban Telephone Co. has increased its capital stock from $10,000 to $30,000.

PHILADELPHIA, PA.—Keystone Telephone Company's net earnings for the quarter ended June 30, 1904, were $86,240, against $53,987 for the corresponding period of 1903.

EL PASO, TEX.—The affairs of the Southern Independent Telephone Company, which was some time ago placed in the hands of a receiver, have been settled up and the receiver discharged, all of the creditors having been settled with and consenting to the action.

FRANCHISES.

SAN PEDRO, CAL.—W. H. Hyatt, a local attorney, has filed application with the city council for a franchise to install a local telephone system.

SANTA ROSA, CALIF.—The Board of Supervisors of Sonoma County have granted a franchise to John R. Denman, John H. Coltoft and Ernest Ormsby.

COLORADO SPRINGS, COLO.—Alderman Holden, at a recent meeting of the city council, introduced a new telephone ordinance granting a franchise to certain citizens. It was referred to the ordinance committee.

HAWARDEN, IA.—The Hawarden Telephone Company has been granted a franchise in Rock Valley.

RUMFORD, ME.—E. F. Elliott and other residents of Rumford have petitioned the selectmen for a telephone franchise.

SWANSEA, MASS.—George W. Fish and others are endeavoring to secure a franchise for the Automatic Telephone Company in Swansea.

HOUGHTON, MICH.—The Automatic Telephone Company has applied for a franchise in this city and will also endeavor to secure one in Lake Linden.

ALEXANDRIA, MINN.—The Merchants Telephone Exchange Company has been granted a franchise by the city council of Alexandria to construct its system in this city.

HERKIMER, N. Y.—The County Telephone Company will install a 10 station intercommunicating system in one of the large offices in the city.

ALBANY, ORE.—N. D. De Varney, of Kansas City, has secured a franchise from the city council for the construction of a telephone system here.

LOCKWOOD, PA.—The Lockwood Telephone Company, of which G. W. Bingham is president and secretary, and Edward Bingham, treasurer, is constructing a rural line from Lockwood to Waverley.

WATERTOWN, S. D.—The city council has granted a renewal of franchise to the Dakota Central Telephone Company.

MONTPELIER, VT.—The Orange County Telephone Company, recently organized, has petitioned the city council for privilege to erect poles and string wires from its central office to connect its stockholders.

HUDSON, WIS.—The Farmers and Merchants Telephone Company has applied for a franchise to construct a telephone exchange in this city.

POUND, WIS.—The town board has granted a franchise to the Farmers and Merchants Telephone Company, of Lena.

ELECTIONS.

GRANVILLE, ILL.—The Granville Telephone Company has elected the following officers: President, W. B. Sill; vice-president, A. D. Fisher; secretary, W. B. Blosser; treasurer, W. P. Mayer. The directors include the officers and C. M. Chase, John Kunkle, W. E. Hawthorne, C. W. Dysart and Olaf Matson.

KEWANEE, ILL.—The Kewanee Home Telephone Company has elected the following directors: W. I. Hobbs, Joseph L. Dunn, E. B. Long, A. C. Shoemaker, W. H. McMillan, F. A. Ellithorn, B. C. Allen and G. B. Thompson.

MADRID, IA.—The People's Telephone Company has elected the following officers: T. I. Dresser, president; J. S. Kennison, vice-president; John Van Zandt, secretary and manager; Oscar Oakleaf, treasurer. The capital stock of the company is now $15,000, but it will have to be increased by at least $4,000 or $5,000. A seven per cent. dividend was declared.

TRUMP, MD.—The Union Telephone Company, of Trump, has elected the following officers: C. L. Almony, president; S. S. Van Trump, secretary, treasurer and manager; Dr. W. Millard Stirling, James P. Jordan, G. G. Winemiller, executive committee. The capital stock of the company will be increased and the lines extended to Freeland and Bradenbaugh.

COMBINATIONS.

FARMINGTON, ILL.—The stockholders of the Farmington Citizens Mutual Telephone Company have purchased the Lafferty division, known as No. 9, running from the water works to Lerna. This line has 40 or more telephones. J. R. Grissamore, manager of the line at Farmington, will be made manager of the new system.

TAMPICO, ILL.—The Farmers' Telephone Companies of Tampico and vicinity, have merged into one company. The following officers were elected: L. A. Wheelock, president; Otto Nelson, secretary; E. A. Emmons, treasurer. The new company embraces practically all the farmers' lines merged at the central at Tampico including Prophetstown and Rock Falls lines.

GUILFORD, IND.—A company has been formed, to be known as the York Ridge Telephone Association which has purchased the telephone line owned by Dr. W. A. Schooley. The following officers were elected: M. Zimmer, president; F. W. Buchanan, secretary; C. P. Ward, treasurer. The line has been repaired and will extend to New Alsace and Weisburg, with connections to Indianapolis and other points.

KENTLAND, IND.—Messrs. Dixon and Jessen, owners of the telephone exchanges at Brook and Morocco, have purchased the Independent Telephone Exchange from W. K. McGray.

MASON CITY, IA.—F. A. Ansberry has purchased the telephone exchange formerly owned by Greenlee & Ansberry.

STRATFORD, IA.—Allen Cox has purchased the Chamberlain Telephone line from Stratford to Linnburg.

CONCORDIA, KAS.—The Concordia Telephone Company has sold its exchange at Jamestown, Kas., to residents of that place. The company of the Jamestown exchange will be reorganized and will be known as the Jamestown Telephone Company.

BELLAIRE, O.—The rumor that the Ohio Valley Telephone Company has been purchased by unknown parties is denied.

TOWANDA, PA.—The Canton-Le Roy Farmers' Mutual Telephone Company has connected with the Beech Flats and Grover system.

FERRIS, TEX.—The local telephone exchange has been purchased by Charles Farrer. It is his intention to extend lines to Red Oak, Rockett, Lancaster and Palmer.

PARKERSBURG, W. VA.—The West Virginia Western Telephone Company has purchased the plant of the Marietta Telephone Company and the two concerns will be consolidated under the name and management of the former company. It is expected that A. C. Davis will be general manager. The price paid was about $80,000.

PERSONAL.

FRANK L. BILLS, the Independent telephone promoter, is at present in Chicago. He expects to leave for Sioux City, Iowa, to look after his interests there within a few days. Mr. Bills reports the Independent outlook as being excellent.

W. H. CRUMB is at present in Hot Springs, where he installed the Independent telephone exchange. Under Mr. Crumb's able direction the system has nearly 1,000 subscribers, whilst the Bell has dropped from 800 to 570.

B. L. FREEDY, manager Northwestern Telephone Company's Exchange at St. Paul, has been appointed general superintendent of the company at Minneapolis. He will be succeeded in St. Paul by R. H. Woolfolk, of the Stillwater Exchange. C. P. Donelan will take charge at Stillwater.

T. P. JORDAN, of Dallas, Tex., has invented a phantom circuit, which he has successfully used over the lines of the Grayson County Telephone Company between Sherman and Dennison.

H. R. KING, designing electrical engineer of the Western Electric Company of Chicago, was married on June 21st at Leadville, Colo., to Miss Irene Baker.

J. P. McGAHAN has been appointed manager of the Central Union Company's Exchange at Youngstown.

R. S. MUELLER, of Chicago, has been appointed manager of the Cleveland branch of the Kellogg Switchboard and Supply Company, to succeed A. B. Kartz.

B. TIRRELL, formerly night operator of the Grand Block Exchange, of the Massachusetts Telephone Company, has resigned his position to become an aeronaut.

E. WILLIAMS has been appointed manager of the East Tennessee Telephone Company's exchange at Bristol.

MISCELLANEOUS.

BLOOMINGTON, IND.—The Bloomington Telephone Company has decided to expend about $25,000 in improving its system. One important feature of the work will be the raising of the wires above the electric light wires throughout the streets.

DETROIT, MICH.—President W. A. Jackson of the Michigan State Telephone Company says that 1,000,000 pounds of copper wire will be used in new construction by the Michigan State Telephone Company this year. The company now has 40,000 miles of copper metallic telephone lines in Michigan and to these circuits will be added 4,000 miles before next fall. The Michigan State Telephone Company has started work in the Michigan copper district on a radical series of improvements. The company has an investment of $300,000 in the copper country, and intends spending $75,000 more in making the proposed changes.

Digitized by Google

THREE RIVERS, MICH.—The Three Rivers Telephone Company is expanding its toll line service, and has placed toll stations at Flowerfield and Howardsville.

EGG HARBOR, N. J.—The Egg Harbor City Telephone Company has commenced business with 25 subscribers.

BEAUMONT, TEX.—C. C. Conroy has disposed of his property, it is reported to H. E. Huntington. This property consisted of the Beaumont & Northwestern Telephone Company.

PRENTICE, WIS.—C. W. Macomber is reported to have bought the local telephone system.

UNDERGROUND.

ATLANTA, GA.—The Southern Bell Telephone and Telegraph Company will petition the city council at its next meeting for permission to construct subways for underground wires in several streets.

BURLINGTON, IA.—The Iowa Telephone Company is arranging to put its wires in Burlington underground.

WINONA, MINN.—The Northwestern Telephone and Telegraph Company has asked permission to construct several underground conduits.

WEST CHESTER, PA.—The Delaware & Atlantic Telephone Company has been granted permission to run all its wires underground.

NEW COMPANY NOTES

BELLAIRE, ILL.—The Louis Bellaire Telephone Company has been incorporated, with a capital stock of $5,000, by L. M. Biggs, J. C. Farley and E. M. Wiman.

CEDARVILLE, ILL.—The Stephenson County Farmers' Telephone Company is being promoted by C. Z. Dillenbeck, and will operate farmers' telephone lines in Stephenson County.

FRANKTON, IND.—The Farmers' & Citizens' Telephone Company has been incorporated with a capital stock of $10,000. The incorporators are: George F. Quick, Thomas Bromley, Jr., Ernest H. Phillips.

HARRISTOWN, IND.—The Harristown Telephone Company has been incorporatod with a capital stock of $14,000. The company will install an exchange in Harristown and lines throughout Washington County. A. B. Cramer, E. P. Norris and others are the incorporators.

IDAVILLE, IND.—The Idaville Telephone Company has been incorporated, with a capital stock of $9,000, by T. B. Ginn, F. J. Royer, W. A. Bryan, G. B. Tam and others.

WILMOT, IND.—The Wilmot Mutual Telephone Company has been incorporated with a capital stock of $10,000, by L. R. Gerrald, J. W. C. Scott, H. T. Kline.

CUSHING, IA.—The Cushing Independent Telephone Company has been incorporated here with a capital stock of $50,000. The incorporators are O. H. Freeman and others.

LAKE PARK, IA.—A rural telephone company has been formed here, with George Lenz as president and C. C. Gregory secretary.

PANAMA, IA.—The Farmers' and Merchants' Mutual Telephone Company has been incorporated with a capital stock of $50,000. N. J. Roundy is president and W. E. Bliven secretary.

SHELLSBURG, IA.—The Farmers' Mutual Telephone Company, of Shellsburg, has been incorporated with a capital stock of $10,000. The officers are J. D. Hagan, president; J. S. Boles, secretary, and J. A. Viles, treasurer; J. D. Hagan, J. M. Heath, D. K. Johnson, E. W. McCully, Daniel Sherman, James Maxon, H. Dickinson, J. W. Miller and A. Muchanek, directors.

STANHOPE, IA.—The Stanhope & Griffen Telephone Company, of Hamilton County, has been incorporated with a capital stock of $1,000.

ARCADIA, KAN.—The Arcadia Telephone Company has been incorporated with a capital stock of $2,500 and will soon begin construction work.

WHITE PLAINS, KY.—The White Plains & Red Hill Telephone Company, of Hopkins County, has been incorporated with a capital stock of $500 by W. L. Moore, R. T. Gunn and B. F. Dukes.

CLARKFIELD, MINN.—The Clarkfield Telephone Company has been incorporated with a capital stock of $5,000.

DASSEL, MINN.—The Dassel & Collinwood Telephone Exchange Company has filed articles of incorporation, and work has been begun on several rural lines.

WHEATON, MINN.—The Lake Valley Co-operative Local Telephone Company has been incorporated with a capital stock of $10,000 by John A. Nonson and others.

BAY ST. LOUIS, MISS.—The Citizens' Light and Telephone Company, of Bay St. Louis, has been incorporated with a capital stock of $40,000.

ST. LOUIS, MO.—The Suburban Telephone Company has been incorporated, with a capital stock of $100,000, by W. L. Travers, of St. Louis; J. P. Phelan, of Wellston, and others.

FULLERTON, NEB.—The Citizens' Telephone Company, of Fullerton, has filed articles of incorporation. The capital stock is $10,000, with $5,000 paid up.

NEWPORT, NEB.—The Farm and Home Telephone Company, of Newport, has been incorporated, with a capital stock of $5,000, by C. M. Thompson and G. E. Van Every.

OAKDALE, NEB.—The Cedar Mutual Telephone Company, of Oakdale, has been incorporated with a capital stock of $5,000.

CORNING, N. Y.—The Hornby Telephone Association, of Corning, has been incorporated, with a capital stock of $2,000, by H. J. Jumerson and A. C. Gifford, of Corning, and W. T. Davis, of Hornby.

CHATHAM, OHIO—The Chatham Mutual Telephone Company has been incorporated, with a capital stock of $100,000, by A. B. Horst, John Yoder, Jr., W. H. Ripley, D. A. Clapp and A. R. Clapp.

FOSTORIA, OHIO—The West Mill Grove Telephone Company, of Fostoria, has been incorporated, with a capital of $3,000, by W. W. Rosendale, C. D. Stearns, J. P. De Wolfe, J. C. Rhodes and S. S. Ghastel.

WREN, O.—The Wren Telephone Company has been incorporated, with a capital stock of $10,000, by J. L. Moser, F. M. Lichtensteiger, B. O. Jones, L. M. Harmon, O. J. Harmon and E. L. Sheets.

CRESTON, PA.—The stockholders of the Cambria County Telephone Company met recently to consider the question of issuing $10,000 preferred stock. The company contemplates a number of improvements, including the extension of lines, and the new stock will be issued to bear the expense.

CONWAY, S. C.—The Conway Telephone Company has been incorporated, with a capital stock of $3,000, by Robert Scarborough and others.

BROWNSVILLE, TEX.—The Brownsville Telephone Company has been incorporated here with a capital stock of $10,000. Telephone service will be given the towns of Brownsville and Matamarot, Mexico. The officers are: B. G. Stegman, president, treasurer and manager; James B. Wellt, vice-president; Frank W. Kibbe, secretary.

HATTON, WASH.—A telephone company has been organized here by O. N. Campbell, A. L. Phelps and H. Sanders. Construction on a line west of the town, connecting with Sand Hills, Line, Kaholutus and Ritzville, will be begun immediately.

CONSTRUCTION.

NEW WESTMINSTER, B. C.—The New Westminster & Burrard Inlet Telephone Company has changed the route of the telephone line to Blaine, Washington, bringing it around by way of Cloverdale.

CAMPBELL, CAL.—The Grange is endeavoring to establish a telephone system at this place.

WASHINGTON, D. C.—Consul-General Richard Guenther, at Frankfort, Germany, reports to the State Department that new telephone lines are to be constructed from Madrid, Spain, to the French border; from Madrid to Galisha, via Santender; from Madrid to Malaga and Cadiz; from Vich to Manllen; from St. Vincent de Torello to Ripoll, and from Elche and Novelas to Pinoso and Cravillente. For particulars apply to Direccion General de Teleghaphos, Madrid, Spain.

CALEDONIA, ILL.—The Badger State Telephone Company will connect with Rosco and Beloit as soon as possible.

CONVERSE, IND.—M. A. Snyder, secretary of the Kokomo Telephone and Electric Manufacturing Company, of Kokomo, Ind., and J. W. Golding, manager of the Sims plant, were in Converse recently with a view to establishing an Independent telephone company giving through service to Sims, Greentown, Amboy and Plevna.

WARSAU, IND.—The Commercial Telephone Company, of Warsau, is building twenty-five miles of telephone line in the rural districts to connect with their exchange in this city.

FORT DES MOINES, IA.—The Hawkeye Telephone Company will install an exchange here.

JEFFERSON, IA.—The Jefferson Branch of the Farmers' Telephone (Mutual) Company has decided to supply the local telephone service. It expects to install at least 100 telephones.

LAKE PARK, IA.—K. G. Chrysler and J. H. Lemuel have a contract for the construction of a rural telephone system here.

STRUBLE, IA.—The Le Mars Telephone Company is constructing lines east and west of here.

CHASE, KAN.—The Farmers' Telephone Company, of Chase, expects to connect 100 more farmers' telephones as soon as harvest is over.

LINCOLN, KAN.—The Lincoln Telephone exchange will install a new switchboard soon. The company reports a very heavy business.

CRUTCHFIELD, KY.—The Local Telephone Company is constructing a telephone system which will reach all the farming districts within a radius of eight miles from here.

MADISONVILLE, KY.—W. H. Settle, who was given a franchise for the construction of a local telephone system recently, is stated to be making arrangements now for the construction of his system.

BLAINE, ME.—W. H. Hackett, of Robinson, and G. M. Young, of Blaine, were at Presque, Iowa, recently, in the interests of the Farmers' Telephone Company recently organized here. It is probable that a line will be constructed to Presque, Iowa.

PORTLAND, ME.—The Mt. Mica Telephone Company is extending its system to Buckfield.

SPENCER, MASS.—Henry Wilson, Peter Richards, A. M. Caldwell, Albert Clark, Louis Freeman, W. C. Bemis and others will petition the selectmen for a franchise to construct necessary lines to give them telephone service.

EMMETT, MICH.—A new telephone company has been formed here and the line is being constructed from the main office in this village to connect with Marshall, Battle Creek and other points.

PEMBINE, MICH.—A new telephone line will be constructed from Wausaukee to Amberg and Pembine at a cost of about $2,000. At Pembine the line will connect with Menominee Range system of Iron Mountain.

BERTHA, MINN.—A telephone line will be constructed from here to Long Prairie.

CLIFFORD, MINN.—The Clifford Telephone Company proposes to construct a line from Clifford to Perham.

DUNDEE, MINN.—A rural telephone system will be constructed here.

HAMBURG, MINN.—A telephone line will be constructed from this place to Green Isle.

MANKATO, MINN.—The Citizens' Telephone Company is constructing a line from St. Claire to Medo.

MONTGOMERY, MINN.—The Farmers' Telephone line is being constructed in connection with the local telephone exchange of the Cannon Valley Telephone Company of Waterloo to Derrynane and St. Thomas.

OWATONNA, MINN.—The Merton rural telephone company has been organized to build a line from this town to Merton.

STILLWATER, MINN.—Work has commenced in building a rural telephone line south from Stillwater to Afton.

WABASH, MINN.—The Plainview Telephone Company will put in an exchange here.

WADENA, MINN.—The Central Minnesota Telephone Company will rebuild the local exchange.

BENBOW, MO.—The citizens of Benbow held a meeting recently for the purpose of organizing a new telephone company to construct a local system.

LA GRANGE, MO.—A hail and wind storm passed south of this place recently, injuring several telephone lines.

GRANITE, MONT.—A telephone line will be built from this place to Red Lyon by William McIntyre.

BLUE SPRINGS, NEB.—The Gage County Independent Telephone Company has commenced construction on two new lines, one running south into Kansas and the other west to connect with line No. 6, already in operation in the western part of the county.

CHAPPELL, NEB.—The Oshkosh Telephone Company is erecting a telephone line in this town.

FALLS CITY, NEB.—The Falls City Telephone Company is contemplating many improvements. J. H. Morehead has just been made general manager of the company. A new line is being constructed to connect with the Hiawatha lines, which will give connection with this city.

NEWBURGH, N. Y.—The Highland Telephone Company has several contracts for new telephones and will extend its lines from Little Britain to Newburgh.

UTICA, N. Y.—The Utica Home Telephone Company is getting ready to put in 8,000 feet of underground cable and to enlarge its main distributing rack. The addition to the switchboard, which accommodates over 800 additional subscribers, is nearly completed.

Digitized by Google

TRADE NOTES

STERLING ELECTRIC COMPANY, Lafayette, Ind., has secured the contract to furnish the Standard Oil Company, of Albany, N. Y., with one of its latest type of private branch switchboards.

THE CENTURY TELEPHONE AND MANUFACTURING COMPANY, of Buffalo, N. Y., has issued a folder describing its "Tungsten special" No. 65 telephone, its Platinum electrode transmitter No. 5, and also its Perfection receiver and Century desk set. Special claims are made for all this apparatus, and to those interested a copy will be sent upon request.

G. M. GEST, the expert subway contractor, of New York and Cincinnati, was awarded last week a contract for the construction of a heavy 20-duct conduit system through Cincinnati, leading from the new exchange to the Fremont avenue exchange of the Cincinnati Bell Telephone Company. This has been necessitated by the tremendous increase of the telephone business in Cincinnati during the last year.

THE F. BISSELL COMPANY, of Toledo, Ohio, is distributing its new net price list. This book consists of 446 pages, and is one of the largest and most complete price books ever published by an electrical firm. The F. Bissell Company also wishes to draw the attention of the trade to its type W A desk stand holder which is gotten up in the most approved manner. To those interested a bulletin descriptive of this holder, together with prices, will be mailed upon request.

THE HARVARD ELECTRIC COMPANY of Chicago has moved into larger quarters at 62 W. Van Buren street, owing to the great increase in its business. The company wishes to announce that it is in a better position than ever to fill fuse orders promptly. This company has the largest plant in the world, devoted exclusively to this branch of the telephone art, and also manufactures extensively for other fuse companies. A new catalogue, No. 14, is now ready for delivery, and will be mailed free to anyone mentioning the AMERICAN TELEPHONE JOURNAL.

THE AMERICAN BATTERY COMPANY, of 172 So. Clinton street, Chicago, is furnishing all the storage batteries used in installations of the Automatic Electric Company. Amongst the systems installed using this type of battery is the Hopkinsville, Kentucky, Automatic Exchange, which was recently completed. This company has an exhibit in connection with the Automatic Electric Company. All who visit the fair are invited to call and examine the different types of cells on view.

THE STROMBERG-CARLSON TELEPHONE MFG. CO., of Chicago, Ill., has recently closed contracts with the Citizens Telephone Company, of Sioux Falls, S. D., and also the Edinburg & Gardar Telephone Company, of Edinburg, N. Dakota, for switchboards and equipments. This company reports many inquiries for its party line instruments, which are so arranged that subscribers can call each other without signalling the exchange, or call the operator without ringing any of the subscribers.

THE VOUGHT-BERGER COMPANY will after July 1st be represented in the Dakotas and some of the western Minnesota counties by J. G. Ball, with headquarters at Fargo, North Dakota. Mr. Ball, who has just left the territory in Wisconsin, Northern Illinois and Iowa, where he has been representing the Central Electric Company, Chicago, is an old-time resident of Fargo, where he is highly connected and has done much work in the telephone and electrical field. A fitter selection could not have been made for this fertile section, where there will be much activity in telephony for years to come.

THE CONNECTICUT TELEPHONE AND ELECTRIC COMPANY, of Meriden, Conn., has placed upon the market a new type of five-bar telephone which is equipped with its non-interfering ringing device. The inability to ring a subscriber when one or more receivers are off the hook, due to people listening in on the same bridging line, limits the usefulness of the service and forms one of the greatest difficulties in heavily loaded rural lines. This company has overcome this difficulty and has issued a bulletin describing the same, which will be sent on request. The company has also issued its new and enlarged catalogue No. 8.

THE CENTRAL TELEPHONE AND ELECTRIC COMPANY, of St. Louis, which recently bought the Missouri Medical College, at 22nd and Lucas avenue, is having the entire building remodelled with new elevators and Granitoid cellars. All new machinery, such as punch presses, band saws, milling machines, screw cutting lathes, etc., will be installed. The buildings are especially desirable on account of their solidity and also because light is available on all sides, besides a big skylight. The company has brought a man from Berlin at great expense to make all the special tools needed in the manufacture of its apparatus. The company has been so crowded with work that it became imperative to move into larger quarters to handle the constantly increasing volume of business that is coming in.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE—The Ottumwa Telephone Company's plant at Ottumwa, Iowa, including Franchise and all its property. The Company owns the three-story brick building, built two years ago, in which is installed a Central Energy System, equipped for 1,540 full metallic lines, with selective ringing apparatus, all of the latest and the best. 1,250 telephones are installed, with 250 names on the waiting list. The Company also owns 80 miles of toll lines. This is one of the best telephone propositions in the State of Iowa. For full particulars, maps and photographs, address the Citizens' Savings & Trust Company, Cleveland, Ohio, or Henry S. Herr, Ottumwa, Iowa. 187

FOR SALE—Telephone plant in Kansas; exchange and county toll line system. Operating conditions very favorable. Investigate this. Address Box 209, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 209

The 1900 Dry Battery

THE most needed quality is reliability. No one wants a battery that will respond all right for a week or ten days then "suddenly go out of business." Another requirement is that it shall continue "strong" during its life. These two requirements besides many others are characteristics of

1900 BATTERIES

We guarantee them not to freeze, leak or break; we warrant them to work with a strong, steady current during their life (anywhere from six to eighteen months).

They are compact, always ready. They are better than wet batteries—no slop, no repairs, no breakage. Any one can replace a worn out one at a moment's notice. They can be carried anywhere—always ready for instant use.

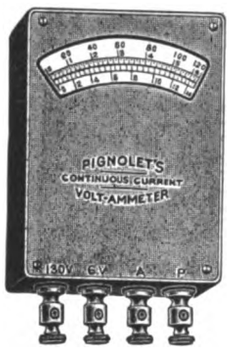
You Will Find It Pays To Test



your lines periodically for insulation and resistance, This can be best done with a Volt Ammeter. Mine are especially designed for this branch of telephone work and are low in price.

LOUIS M. PIGNOLET

Originator of the Voltmeter Habit.

78 CORTLANDT ST., NEW YORK

One Man

out of one hundred interviewed said he preferred a monthly paper.

"Why?" he was asked.

"Because" said he, "the monthly is larger."

He was not pressed to subscribe to The American Telephone Journal, because—well the reasons are entirely obvious.

THE AMERICAN TELEPHONE JOURNAL

A Trade Paper—

Like THE AMERICAN TELEPHONE JOURNAL is read by busy men for the amount of instruction they get from it—not for recreation or amusement. As a rule they have not much time to pay compliments, and, therefore, when they do, it means that the paper must be more than ordinarily valuable.

"Enclosed please find $1.00 to renew my subscription to your most excellent journal. We find it *indispensable*, and we cannot see how any Independent company could or would do business without it.

"NEW ALBANY HOME TELEPHONE CO.,
"F. J. Beaucond, Mgr.,
"New Albany, Ind."

The above letter is one of many received by the Editor of this paper, which show its standing as the organ of the Independent telephone industry.

Gentlemen:-

In referring to your favor of the 1st., will say that it gives me much pleasure to state that the companies I represent have in the neighborhood of fifteen hundred Swedish-American telephones working , both central energy and magneto , bridging and series , desk sets of both systems . They are giving entire sarisfaction .

In addition to the satisfaction derived from the use of your equipment , our companies have always found your house willing and ready to promptly rectify any defects that have shown up in the use of so many instruments , in addition , according to us all the courtesies that any one could reasonably ask .

The telephones and treatment have been entirely satisfactory.

Yours truly
Theodore Gary

VOLUME 10 SATURDAY, JULY 23, 1904 NUMBER 4

THE INDEPENDENT EXCHANGE AT ELKHART, IND.

THE development of Independent telephony has been most general in the central States, and of these Indiana has always been foremost in the movement, both in time and in rapidity of construction. New exchanges are springing up as if by magic, and the whole country is rapidly being grid-ironed with telephone lines which are exclusively Independent. The new exchange recently established at Elkhart is an excellent example of the way the Independents have set about their work, both from a business and technical standpoint.

The town of Elkhart is situated a few miles south of the Michigan State line, and almost in the center of the State in an east and west direction. According to the census of 1900, there was a population of 15,184. Elkhart is one of the most progressive towns in the State of Indiana, and is besides an important station on the Lake Shore Railroad, all the trains of which road, even the limited expresses, making a stop. A few miles to the west is South Bend, another thriving town and a little to the southeast is Goshen, the county seat of Elkhart County. As soon as the Independent toll lines began to ramify over the State, it became evident that the closest business and social relation of these three towns demanded a telephone communication with each other and the neighboring villages. The result was the promotion of the Home Telephone Company, of Goshen, and the Home Telephone Company, of Elkhart. The shire towns began to realize the importance of telephone connection with Elkhart and Goshen, which resulted in the forming of the New Paris Mutual Telephone Company, the Clinton Township Telephone Company of Millersburg, the Dunlaps Telephone Company of Dunlap, the Bristol Telephone Company of Bristol, and Middlebury Telephone Company at Middlebury. All of these companies being connected with Elkhart and Goshen and giving their subscribers free service to and from. This makes each town particularly intimate, so intimate, in fact, that this region is virtually a large city, with a radius of twenty miles, and with a total number of subscribers of over three thousand (3,000).

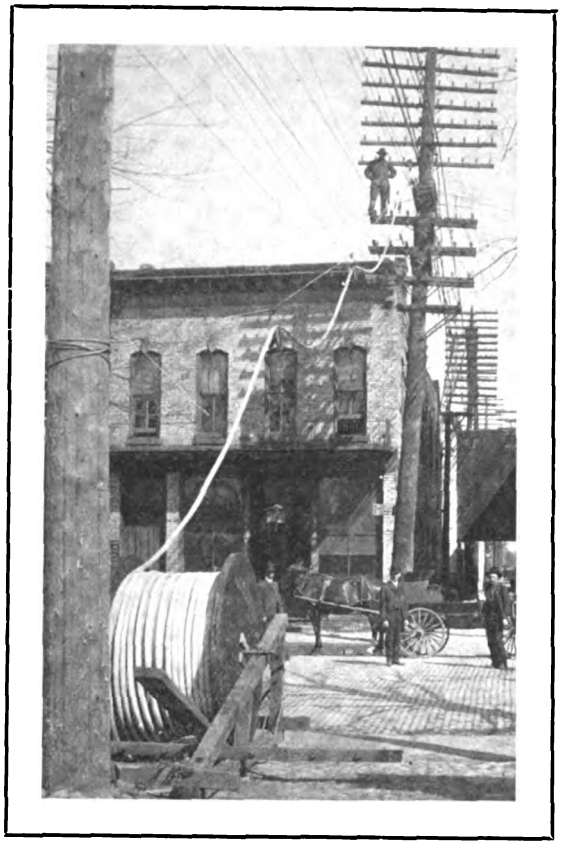

Fig. 2. Line Construction.

In this chain of exchanges, the Elkhart Company became one of the most important. From a small beginning, needing the services of but one operator and a 100-line switchboard, it has recently reconstructed its system and put into operation a switchboard of the latest central energy type. The company has provided a substantial and ornamental brick building, 66 feet by 25 feet, in which space is secured for both the telephone apparatus and the business offices.

The main operating room, shown in Fig. 1, is 24 by 40 feet, the wire chief's and trouble clerk's room is 12 by 18 feet (Fig. 3), ladies' lounging room is 12 by 15 feet, terminal room in which is located the batteries is 12 by 21 feet; also located in this room is the ringing and charging machines. This is on the second floor of the building which is centrally located and is owned by the company.

On the ground floor is a reception room 12 by 18 feet, in which are located long distance pay stations. The cashier's office is divided from this by glass partitions. Immediately back of the cashier's office is the manager's

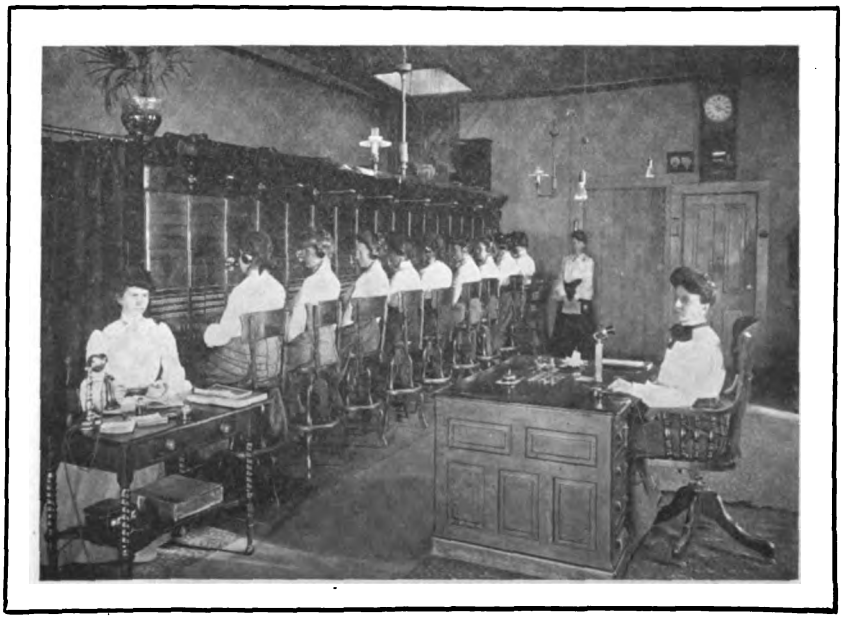

Fig 1. Switchboard of Home Telephone Company, Elkhart, Ind.

Digitized by Google

private office. In the rear is the store room, 21 by 25 feet.

The switchboard is a metallic central energy board, made and installed by the Sterling Electric Company, of La Fayette. The capacity installed is 1,200 lines, with 2,400 lines ultimate capacity. A separate toll board also of the Sterling Electric Company's make, is provided; also the chief operator's monitor desk and wire chief's test board. The cross connecting racks and intermediate and protection mounts and power board are of the Sterling Electric type. The charging and ringing machines are made by the Holtzer-Cabot Company.

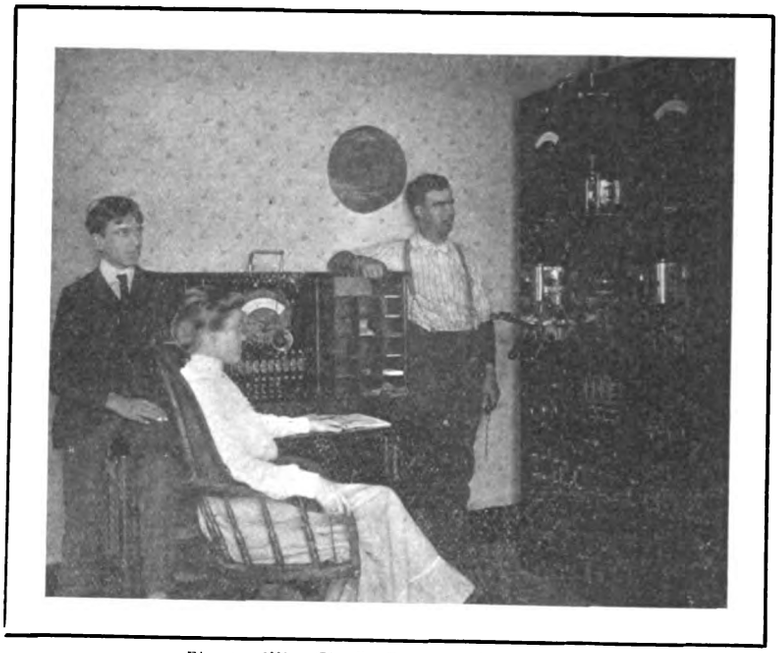

Fig. 3. Wire Chief's Desk and Power Board.

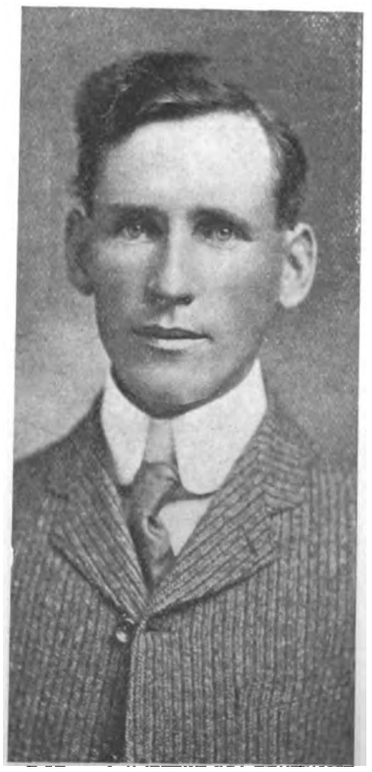
Realizing that in the long run the best construction is the cheapest, the Elkhart Telephone Company decided to use aerial cable as far as possible for the circuits. To free the streets from the objection of overhead lines the distributing poles are as far as practicable placed in the alleys. The poles used are large and substantial and bid fair to offer defiance to many a sleet storm for years to come. Whenever corners occur the poles are heavily double armed. The upper portion of each pole is occupied by the open wire arms that carry the distributing circuits and such open wire lines as are necessary, the cables being carried on substantial iron cross arms directly beneath. Fig. 2 is from a photograph taken during line building and indicates both the type of construction advocated and the methods employed to secure it.

The increase of subscribers at Elkhart and Goshen has been so great that the company has been unable to keep up with the demands for new telephones. It has just completed stringing 14,000 feet of additional cable, which will only relieve the congestion for a short time. As an evidence of what Independent telephony means in Indiana, the following table shows both the relation between the number of Independent and Bell subscribers in the various northern Indiana towns and indicates the field that the Elkhart Telephone Company offers to its patrons:

	Independent.	Bell.
Elkhart Co., Ind.....	3,535	350
St. Joseph Co., Ind.....	3,500	625
Marshall Co., Ind.....	1,000	31
Kosciusko Co., Ind.....	1,500	4
Lagrange Co., Ind.....	900	5
Noble Co., Ind.....	1,100	400
Steuben Co., Ind.....	1,265	50
La Porte Co., Ind.....	1,250	160
Whitley Co., Ind.....	1,500	4
Fulton Co., Ind.....	775	4
Pulaski Co., Ind.....	250	1
Starke Co., Ind.....	300	2
Allen Co., Ind.....	4,000	800
Berrien Co., Mich.....	1,375	8
St. Joseph Co., Mich....	325	33
Total.....	32,575	2,177



J. K. Johnston, Manager
Home Telephone Co., Elkhart, Ind.

The Home Company has more telephones in Elkhart County than the Bell Company has in fifteen counties in northern Indiana. There are in the State of Indiana 107,000 Independent telephones and 40,000 Bell telephones. This growth has developed to such an extent as to make the Bell Company a ridiculous farce in many sections of the country, and the portion of the public, who were originally antagonistic to competing telephone service, because of the service of the two companies, are now outspoken in their compliments to the Independents for the advanced position they have taken in furnishing up-to-date service at reasonable prices. The Home Telephone Company of Elkhart has made it possible for every person whose income is sufficient to permit him to ride on a street car, to afford a telephone. For instance, the Bell Company operated in Elkhart for a period of fifteen to twenty years and had not to exceed at any time, over three hundred (300) subscribers.

At the time the Home Company started in Elkhart the Bell Company had, possibly, one hundred (100) subscribers. The business man was paying from $48.00 to $60.00 per annum, according to the style of service; from $36.00 to $48.00 per annum for residence of which none but the rich could afford. To-day the Home Telephone Company is furnishing service to 1,326 subscribers in Elkhart and over 100 contracts are waiting to be connected. The company is now putting up 1,400 feet of new cable which will accommodate 450 more additional subscribers.

Much of the credit for the successful operation of the Elkhart system is due to the able management of J. K. Johnston, who has worked zealously for the company.

A company representing Elkhart capital has been organized to put in an exchange at Pullman's Corners, Michigan. This exchange will open up with about 100 subscribers located in Adamsville, Edwardsburg, and the southern portion of Cass County. The officers are confident that this exchange will have 200 subscribers. This will enable the present subscribers of the Home Telephone Company to connect with a territory that depends largely on Elkhart as its business center.

Besides the local service, subscribers to the Home Telephone Company can by means of Independent long-distance toll lines reach all points in Indiana and Ohio and parts of Michigan, Illinois and Pennsylvania. In this territory there are upwards of 250,000 Independent telephones, a number far in excess of the Bell. When the long-distance lines which are being projected are completed, the people who subscribe to the Independent systems will be able to reach more points and more people in the United States than the entire Bell systems have subscribers.

SOME REMARKS ON INSTRUMENT SETTING PROTECTIVE DEVICES.

By B. C. Wilhelm.

THE method employed for building the drop line, from a cable box, differs in no way from that already described for the case where the connection is made with the open wire line. The method of attaching the wire to the line, however, is simpler, and consists merely in fastening to the proper binding posts in the box. The term "simpler" which has just been used, must not be understood as conveying the idea that less care is necessary in the performance of this work. Such is not the case. Just as much care must be exercised in attaching a wire to a binding post as is necessary in making a soldered joint. The idea intended to convey was that the work did not take so long and did not require the use of so many pieces of apparatus.

Some telephone companies equip the cable boxes with a wrench and a screwdriver fastened to opposite ends of a chain. This wrench is made out of a brass casting, one end having a hexagonal hole, which fits over the nut, and the other end being shaped to be used as a handle. The screw

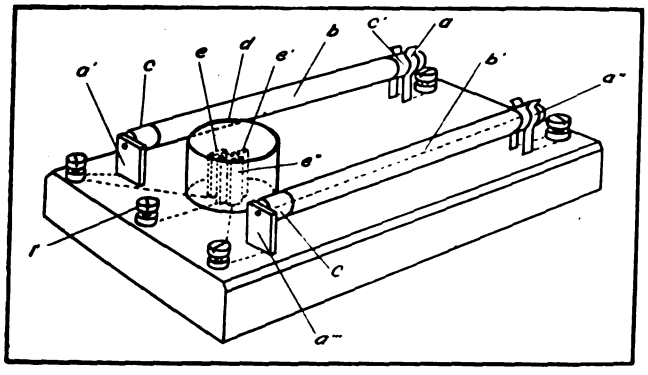

Fig. 5.

driver is made wholly of metal. It is used in tightening the fuses

On all drop lines built from terminals of open wire lines, and aerial cables, and wherever the drop line itself is of sufficient length to render crosses with high tension foreign wires liable, some approved form of protection device must be placed on the line in such a manner as to protect the telephone and the building in which it is placed. This protection device must prevent the entrance into the building of currents resulting from high foreign potential and also from lightning discharges. The currents which result from foreign potential may be either strong or feeble. In the latter case they are called "sneak" currents. The protection device must therefore consist of three parts: That which keeps out strong currents, that which keeps out feeble

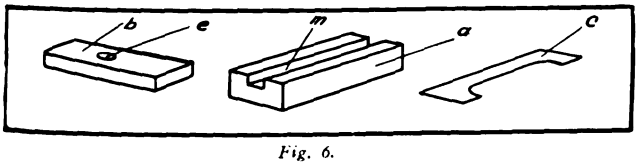

Fig. 6.

currents and that which keeps out high potentials such as those resulting from lightning discharges. In Fig. 5 is shown one form of protection device, which possesses all the essential features. Mounted upon a porcelain base are four brass clips, *a*, *a'*, *a''* and *a'''*, which hold two fiber tubes, *b* and *b'*. These two tubes are equipped at each end with brass bands *c*, *c'*, which make electrical contact with the clips when the tube is held in place. Within each tube is placed at one end a coil of fine wire, one end of which is soldered to the brass ring, *c*; and the other end to a fuse, which runs to the opposite extremity of the tube and is connected to the ring, *c'*. Situated between the two tubes and near one end of the porcelain base is a circular brass cup, *d*, without a bottom. In the center of this cup, and fastened to the porcelain, are three brass strips, *e*, *e'* and *e''*. Of these the two outermost strips are narrower than the center one, which is connected to the binding post, *i'*. Between each one of the outer strips, *e* and *e''*, is placed a protector consisting of two blocks of carbon not shown, which are separated from each other by a strip of mica. A brass cap which screws over the cup is used

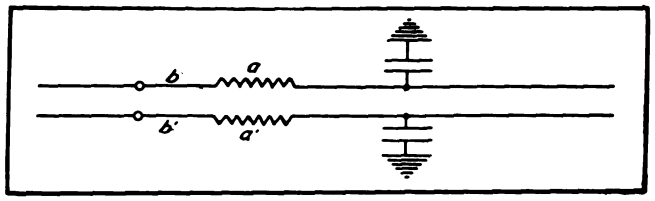

Fig. 7.

to keep out the dust. One of these carbon blocks has a depression bored into the center, into which is placed a small lump of solder.

Under normal conditions the two carbons are separated by an air space equal in thickness to that of the mica. Should, however, the lump of solder melt from some cause or other, it will run out, fill the gap and make good electrical contact between the two. The two carbons and the mica are shown in detail at *a*, *b* and *c*, respectively, in Fig. 6. The lump of solder will be seen at *e*. The carbon, *a*, which rests against the outer spring, is notched, as shown at *m*, so that the spring may fit in and hold the carbon in position. The two outer springs must be bent sufficiently to press the carbon against the middle strip and hold them in place. The three strips, *e*, *e'* and *e''*, Fig. 5, must be placed in a horizontal line, so that when the carbon arresters are placed the space between them will be vertical. This arrangement affords whatever dust may collect a chance to fall out. In placing the mica strips between the carbon blocks, the notch should always face downward, so as not to afford a surface, upon which the dust might collect between. The scheme of wiring the arrester is shown in Fig. 7. The two live wires pass first through the fine coils, *a*, *a'*, and thence through the two fuses, *b* and *b'*,

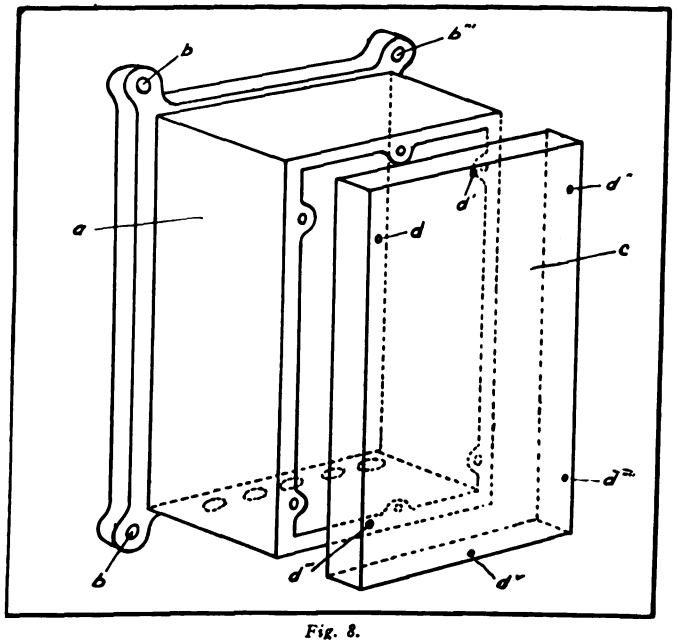

Fig. 8.

the two carbon arresters being bridged to ground, one from one side of the line and the other from the opposite side. These two bridges are open under normal conditions at the two air gaps above referred to.

The method of operation of this piece of apparatus is as fol-

Digitized by Google

lows: Should a sneak current enter on the line, the fine wire coils will be heated up sufficiently to burn and open the circuit so as to prevent the current from entering the building. Should a heavy current enter, the fuse will be blown, probably before the

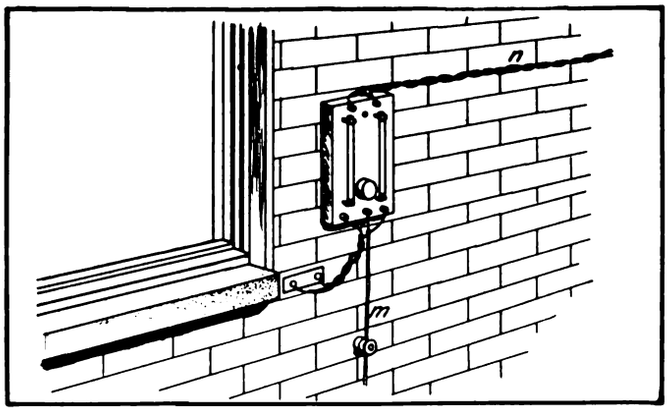

Fig. 9.

fine wire coil has time to melt. This again will open the circuit. If by means of lightning discharge the line be charged to an excessively high potential, it will in attempting to reach the ground, jump across the airgap between the carbon arresters. In doing so it will melt the lump of solder, which in turn will form a solid connection to ground, so that the potential may pass off without doing any damage.

Referring again to Fig. 5, the middle strip, *e'*, is connected to the middle binding post, *i'*, which in turn is wired to ground. The two outside binding posts are for the line wires, and are connected to the clips, *a* and *a'''*.

The protection device already described may be installed either upon the outside or the inside of the building. When it is installed upon the outside it must be incased in a weather proof box, which is sufficiently strong to resist mechanical injury. The box must be so constructed as to be capable of being readily attached to a brick wall, and must be equipped with a water tight cover that can be readily removed to give access to the interior. Such a box is shown in Fig. 8. It consists of a box shaped iron casting, *a*, from the back of which projects four lugs, *b*, *b'*, *b''* and *b'''*, and through holes drilled through the center of each one screws are driven into the surface, upon which it is to be mounted. The cover, *c*, also of cast iron, is held in place with screws, *d*, *d'*, *d''*, *d'''*, etc., and is made to fit tight by means of a rubber gasket. Through the bottom of the box five holes are drilled. Two of these are for the drop wire, two for the leading-in wire and the remaining one for the ground wire. These holes are bushed with porcelain tubes.

In Fig. 9 will be seen a protector mounted inside of the building. The drop wire is seen entering to the right of the window, the house wire coming off at *n* and the ground wire at *m*.

In attaching wire to the binding posts of the arrester, the same care must be exercised as has already been mentioned in connection with the cable box binding posts.

THE RESTRICTED TELEPHONE LAWS OF CONNECTICUT.

TELEPHONE monopoly is strongly intrenched in the statutes of Connecticut and the extension of the lines of the Independent companies already established in the State, or the organization of new ones, is rendered extremely difficult by legislative barriers. By the laws of 1899 every telephone company in existence on May 3rd of that year is limited in its operation to towns in which it was doing business on that day, except upon a finding that public convenience and necessity demand an extension of its field. In the same way, no new company can establish its system and construct its plant without such a finding; the finding to be made by the Superior Court of Connecticut or a judge thereof, in due form. Notice must be given of the application to the selectmen of any town, to the warden and burgesses of any borough, of the day of hearing; or to the mayor of any city within which the extension or construction is sought to be made. Ordinarily, this alone would be impediment enough in the way of the erection of a telephone line, because the planting of poles is, under any circumstances, objectionable to adjacent owners of property, and the opportunity of objecting to the municipal authorities would be readily taken advantage of by the property owners.

The purpose of this act is most clearly seen in the requirement that notice shall be given at least twelve days before the date of hearing to any other telephone company, association, or corporation, that may be affected by the construction or extension of the new system. Under these provisions a competing telephone company is permitted to come into court and object to the construction nor extension of the new line on the ground that the already established company is giving satisfactory service, supplying all the telephones required, at reasonable rates. This places the establishment of Independent companies in Connecticut in the power of the Southern New England Telephone Company, the local branch of the Bell monopoly. The superior court or judge is empowered to hear the parties and determine whether, upon consideration of the facts, circumstances, and conditions of the business, public convenience and necessity require the proposed action. The decision of the court or judge is final and conclusive, subject to appeal to the Supreme Court on questions of law only. The act applies only to companies organized for the transaction of a telephone exchange business, and it has been contended that companies which used an "interior" system, in which no central operator is employed, were not doing a "telephone exchange business" and were, therefore, not amenable to the law. Although the question has not been passed upon by the Supreme Court the contention seems valid, since the law should be strictly construed.

The statute would also not apply to an individual engaged in the business. Haynes vs. Crosby (Me.), 47 A., 137. This was the holding under the restrictive telephone law of Maine, which provided that "no corporation organized hereunder shall have authority, without a special act of the legislature, to construct its line along the route or routes used, or authorized to be used, by any other telegraph or telephone company, person or firm, or between different points connected or authorized to be connected by the lines of any such company, person, or firm, unless it shall first obtain the consent of such other company, person or firm." The court said of that law what is true of the Connecticut law, that "this statute is so prohibitive of competition, even if wholesome, that we are not inclined to an extension of its operation beyond its plain and specific language. It prohibits corporations organized under the act from establishing a telegraph or telephone line in competition with an existing or authorized line, without the consent of such existing company, but it does not prohibit an individual, not incorporated, from establishing and operating such a line."

The most objectionable feature of the infamous Connecticut laws is the difficulty of proving the public convenience and necessity required by the statute. The officers of the Bell Company will always be ready to swear that they can furnish all the telephones required by the public; and they can always prove that their profits are reasonable and not exorbitant, the latter fact being so exclusively within the knowledge of the officers that it would be almost impossible to obtain contradictory evidence. The law was very evidently draughted by the Bell Com-

Digitized by Google

pany in its own interest, and no matter how strictly it is construed, it cannot fail to operate to the advantage of its promoter. The principal sections of the law follow:

SECTION 3918—RIGHTS OF COMPANIES IN OPERATION MAY 3, 1899, LIMITED.

Every company, association, or corporation heretofore organized under a special charter, or under any former joint stock law of this State, for the transaction of a telephone exchange business, in whole or in part, is hereby limited to its operation, so far as pertains to the telephone exchange business, to the limit of the town or towns in which the plant and structures of such company, association or corporation actually existed, and were in operation, in whole or in part, on the third day of May, 1899, except upon a finding that public convenience and necessity require an extension of such limits as hereinafter provided.

SECTION 3919—HOW COMPANY MAY BE AUTHORIZED TO EXTEND OPERATIONS.

Every such company, association or corporation whose plant was so in existence and in operation on the third day of May, 1899, desiring to extend its telephone exchange business to another town or towns, and any other such company, association or corporation heretofore existing, or hereafter organized under the laws of this State to do a telephone exchange business, is hereby prohibited from taking any steps under the general statutes of this State, for the location of its poles or conduits, and from commencing to construct its said extension or its said plant until it shall have applied to the Superior Court or to a judge thereof, and shall have attained from such court or judge, in the manner hereinafter provided, a finding that public convenience and necessity require the carrying on of such telephone exchange business by such company, association or corporation, within the territorial limits, or some portion thereof, stated in its application.

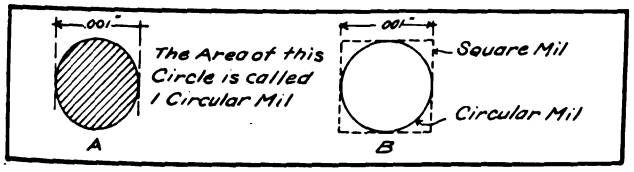
SECTION 3920—COURT OR JUDGE SHALL DETERMINE WHERE TELEPHONE SYSTEM IS NECESSARY.

Every such company, association or corporation intending to construct or extend a telephone system for doing a telephone exchange business shall make application to the Superior Court or to a judge thereof for a finding that public convenience and necessity require the construction or extension of such telephone system by such company, association or corporation, and any such application shall state the territorial limits in which it is intended in good faith to extend or construct such telephone system; and such court or judge shall thereupon fix a time and place to hear such application, and shall cause notice to be served at least twelve days before the date of the hearing upon any other telephone company, association or corporation organized under special or general law, that may be affected by such construction or extension, and upon the selectmen of any town, the warden and burgesses of any boroughs, or the mayor of any city, within whose limits such extension or construction may be made. Such court or judge may hear the parties and determine whether, upon consideration of the facts, circumstances and conditions of the business, public convenience and necessity require the extension as heretofore defined, or the construction of such telephone system by such company, association or corporation, and the decision of such court or judge, subject, however, to review on appeal to the Supreme Court of Errors on question of law arising in the trial of said case, shall be final and conclusive upon the parties. Such court or judge, upon such hearing, may make a finding that public convenience and necessity require the extension or construction of such a telephone system by the applicant in whole or a part of the territory named in the application.

THE "CIRCULAR MIL," ITS DERIVATION AND CALCULATION.

By Clayton Traverst.

It is often more convenient to specify the sectional area of an electrical conductor than to give its wire gauge number, and where the conductor is larger than .46 inch (No. 0000 A. W. G) it is imperative, as 0000 is the largest gauge number in general use. The *circular mil* is a unit of measure developed by electricians to avoid the awkward calculation necessary to get actual area in square inches. Referring to Fig. *a*, if a circle could



be drawn having a diameter of one one thousandth of an inch, its area would be one *circular mil*. (The illustration is enlarged many times.) That is, electricians have agreed to name such an area a *circular mil*. The usual abbreviation is *C. M.*

To find the area in circular mils of any conductor of circular cross section, square its diameter expressed in thousandths of an inch. (The reason for this will be explained later.) *Example*: Find the area in *C. M's.* of a No. 0000 copper wire. The diameter of 0000 is forty-six-hundredths of an inch (.46"). Forty-six-hundredths expressed in thousandths is four hundred and sixty thousandths (.460"). Therefore

$$460'' \times 460'' = 211{,}600 \text{ } C.\ M's.$$

As an illustration to show the large amount of work that is avoided by the use of the circular mil, we will follow the regular method used in calculating the area of the wire in square inches. The area of a circle equals *the diameter squared times .7854*, or expressed algebraically

$$A = d^2.7854$$

Therefore substituting values from the previous example

$$A = .46 \times .46 \times .7854$$
$$.46 \times .46 = .2116$$
$$.2116 \times .7854 = .1663+$$

Where the *C. M.* method is used the use of the constant .7854 is avoided.

Now to explain the *C. M.* method. A rule of arithmetic tells us that the areas of circles are proportional to the squares of their diameters. That is, if one circle has twice the diameter of a second, it will have four times the area because $2^2=4$. Expressed in the form of a proportion, this statement reads:

$$\frac{A_1}{A_2} = \frac{d_1^2}{d_2^2}$$

Therefore, if a circle one mil (1 m) in diameter has an area of one *circular mil*, (1 C. M.), a circle four hundred and sixty mils in diameter. (460 M) will have, four hundred and sixty squared, *circular mils* area (460^2=C. M. area), or substituting in equation (1).

$$\frac{1}{A_2} = \frac{1^2}{460^2}$$

Sometimes it is desirable to express the area of a rectangular or square cross section in *circular mils* or *vice versa*. In such an instance it is best to first obtain the area in *square mils*. A square mil is an area equivalent to that of a square, having sides one one thousandth of an inch long. A square *mil* is shown enlarged in Fig. *B*. To do this, *multiply the value of the base of the rectangle expressed in thousandths by the value of the altitude*

Digitized by Google

likewise expressed. The figure shows relatively the sizes of a *circular mil* and of a *square mil.* Obviously the *circular mil* is the smaller area. The area of the *square mil* in square inches is

.001"×.001"=.000,0001 square in.

The area of the *circular mil* in square inches is

.001"×.001"×.7854=.000,007,854 square in.

Therefore the area of the *square mil* is to that of the *circular mil* as 1 is to .7854 or

$$\frac{\text{A S M.}}{\text{A.C.M.}} = \frac{1}{.7854}$$

Therefore, to get square mils multiply circular mils by .7854.

To get circular mils divide square mils by .7854.

Example: What is the area in *C. M's.* of an aluminum bar 1 inch by 2 inches in section?

1 inch=1,000 mils.

2 inches=2,000 mils.

1,000×2,000=2,000,000 sq. mils.

$$\frac{2,000,000}{.7854} = 254,646,000 + C.\ M.$$

A=.46×.46×.785

From the foregoing it is evident that in calculating the use of the mil is to be preferred to the usual methods.

LONG DISTANCE TOLL-ACCOUNTING.

ARTICLE II.

By C. L. Norton. *General Toll Accountant, United States Telephone Co., of Ohio.*

PREPARATORY to the work of handling the reports after they are received by the general toll accountant, it may be well to emphasize the need of adapting a uniform practice of classifying all messages into four sources, namely, "tolls sent paid," "tolls sent collect," "tolls received paid" and "tolls received collect." A concise explanation appears on a circular letter of instructions. An enormous amount of confusion is the result of trying to locate "check errors," if some exchanges are permitted to report "reversed messages," either as "tolls sent paid" or "tolls received paid."

All toll reports should be forwarded before the 10th day of each month, but in cases where a local exchange company has several toll stations to report, it is impossible to receive this particular report until the 25th of the month. As soon as the report is received the amount of gross revenue, which consists of "tolls send paid" and "tolls received collect," is entered on to a daily statement, together with the amount of business transacted during the previous month. This information makes it possible for the management to know each day the amount of decrease or increase in revenue, together with the percentage of such gain or loss. The reports are then verified to detect errors in addition, or computation.

After all reports are received and verified, the individual items of debits and credits are entered on the toll abstract ledger, Fig. 6, which affords a summary of the tolls transacted for the entire system. A certified, classified statement of such totals is then prepared for the auditor.

Where a local company has toll lines of its own which are used for connecting toll stations with the lines of the United States Telephone Company, extra territorial line business or mileage is computed, which is the division of interchanged tolls passing jointly over the lines of the United States Telephone Company and the local company.

All toll business that is subject to a mileage pro rata must be reported to this company, giving full information as to the number of messages, together with the amount of the originating and terminating tolls.

Before a mileage credit is computed, the commission paid the station originating its tolls, together with the commission paid the station originating the tolls terminating at a local company, must be deducted.

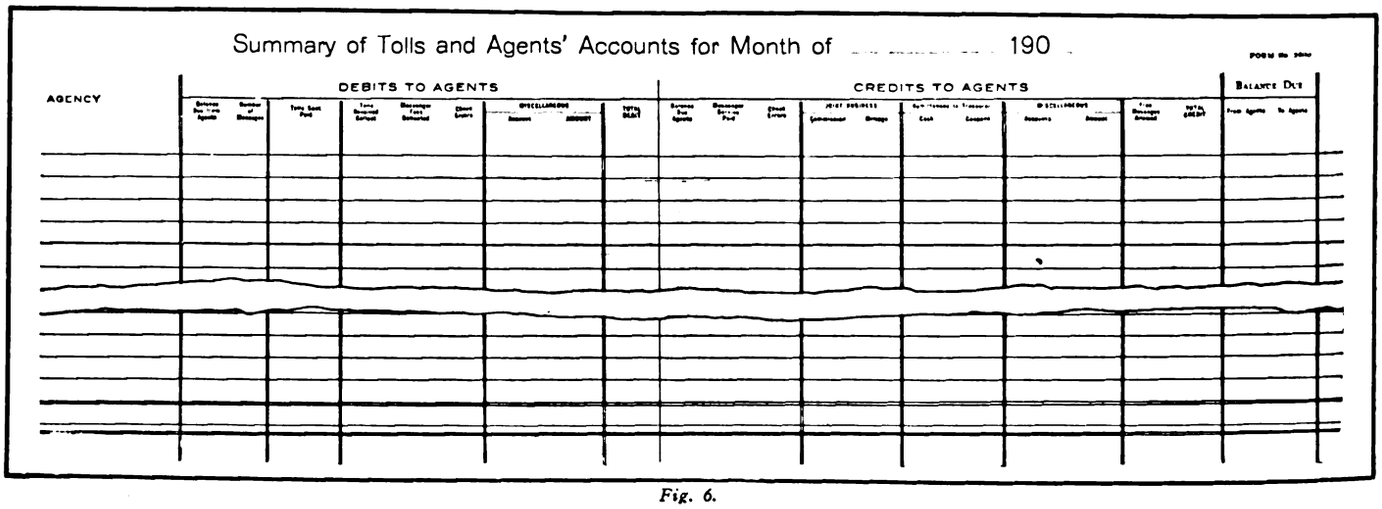
The net amount is then divided proportionately, to the distance that each company's haul bears to the total haul. All measurements to be made direct air line and not pole line.

On originating business the haul that is credited to a local company is the distance a message is hauled over the local line from the point of origin to the nearest exchange having direct connection with our circuits; this place is known as a switching, or transferring point, our haul on the same message being based from the switching point to the point of destination.

On terminating business the local company is credited with the distance from the point of transfer to the point of destination, our distance being computed from the originating point to the point of transfer.

For example, let the United States Telephone Company be known as the first party and a local company as the second party. Let "A" represent a substation of the second party and "B" an exchange connected directly with the lines of the first party, but belonging to the second party, and "C" a point on the lines of the first party belonging to some other local company.

The distance from "A" to "B" over the lines of the second party is 10 miles. The distance from "B" to "C" over the first party's line is 30 miles. The number of messages originating at "A" for "C" is 80; at the rate of 10c. amounts to $8. The number of messages terminating at "A" from "C" is 80; rate, 10c.; amount, $8.



Summary of Tolls and Agents' Accounts for Month of ..... 190 .

AGENCY

DEBITS TO AGENTS

CREDITS TO AGENTS

BALANCE DUE

Fig. 6.

Digitized by Google

Originating tolls	$ 8.00
Terminating tolls	8.00
Total	16.00
Less 25 per cent. com. paid local companies for originating commission	4.00
Net amount to be divided	$12.00

Business Interchanged.	No of messages sent and received.	Local Haul, Miles.	U. S. Haul, Miles.
"A" to "C" & "C" to "A"	160	1600	4800

Total number of miles arrived at by multiplying the number of messages transacted by each station by the air line distance that each station is entitled to.

As the total haul of both companies is 6.400 miles, the local company's fractional proportion is $\frac{1600}{6400}$. By multiplying $12 by the fraction, a mileage credit is obtained of $3.

After the mileage credit is obtained, three settlements are made. First, business transacted at the exchange connected directly on our circuits. Second; business transacted at a toll station that passes over local lines before connecting with our circuits. Third; a recapitulation of settlements No. 1 and No. 2, or a general settlement of the month's toll business. This settlement is mailed back to the local company for their verification, and after it is checked, a remittance is forwarded back to this company covering the debit balance as submitted.

The next procedure is to cross-check all reports for the omission of tolls, after this work is performed. "Error sheets," Fig. 7, are compiled and sent to the local company; inasmuch as some little time is required for investigation by the local company of such errors, aggravating delays are experienced in some instances. To hasten the return of an "error sheet," with explanations and remittances, postal cards, or other means of communication are necessary.

To further facilitate the local company's work in locating omissions, requests are frequently received for a copy of a ticket, or tickets for business transacted with a certain station reported as in error, postal cards are then forwarded requesting such information as required.

Immediately after the reports are cross-checked they are then verified as to the rates used by the local company. If incorrect rates are used, a detailed report of the correct rate and the rate used by them in error is sent to them, emphasizing the importance of using the rates as issued by the general office.

Reference is made especially, to the record of "mileage," which must be kept up each month in order. A book of irregularities is essential for the Checking Department. No period of checking passes that does not add information to this valuable record.

Line rentals; This revenue consists of "terminal loop service," "leased telegraph service," and, "special toll service," and the accounts are handled separately from the toll reports; after the management has made a contract for any service, an abstract of the contract is furnished the General Toll Accountant, who immediately places the copy into a binder after properly indexing the record.

REMARKS

Fig. 7.

It is found that better results are obtained by making invoices at a certain period each month; this requires a new contract to be billed from the date of such issuance to the first of the month next following. In this way all invoices are made the first day of each month. The form used is shown in Fig. 8.

Before the invoices are mailed, a transcription is made of the name and amount, which is kept before the person who has charge of the accounts, and by a system of "following up" letters, the accounts are paid in a most satisfactory manner. At the end of each month the Auditor is furnished a certified trial balance and distribution, of all accounts of this description.

TELEPHONE LAWS IN CONNECTICUT.

INDEPENDENT telephone companies and associations everywhere have been vitally interested in the gallant fight which the Farmington Valley Telephone Company, of New Britain, Conn., has been waging against the telephone laws of that State. THE AMERICAN TELEPHONE JOURNAL has followed this litigation, step by step, and has come to the reluctant conclusion that there is no chance for a natural development of Independent telephony in Connecticut as long as the present telephone laws are on the statute books.

Connecticut seems rather inclined toward extremes in legislation. In the early days of the State there were enacted by the Legislature a series of so-called blue laws by which the State government undertook to legislate the most violent and frosty kind of morals into the people. In these telephone laws the Legislature has gone to the other extreme, and, under the plea of protecting the people from speculation in franchises on the part of ephemeral corporations, has actually turned over the State to the grasp of a merciless monopoly. The telephone laws can well be called the black laws of Connecticut.

In passing the infamous laws of 1899 the Connecticut Legislature practically served notice on the telephone public that no other than a Bell company need apply. If this interpretation had been stated in so many words it would not have been more clear what was the meaning and purpose of the laws. One section limits every telephone company organized prior to May 3, 1899, for the transaction of a telephone exchange business, to the limits of the town or towns in which such exchanges actually existed on that date, "except upon a finding that public convenience and necessity require an extension of such limits as hereinafter provided."

The next section is broader. It pertains to all telephone companies, whether they were in existence prior to this date or thereafter organized, and prohibits said companies from commencing the building or extension of their plants without obtaining from the Superior Court a finding that public convenience and necessity require the carrying on of said business. A third provision clinches these nails on the other side.

These are the laws that the Farmington Company went up against when it undertook to extend its lines, and it is interesting to note that the company successfully "called the bluff" and applied to the Superior Court for a finding of "public necessity and convenience."

The failure of the opposition to object to this finding, in this particular case, does not alter the manifest purpose of these laws, and does not make them any the less an outrage on a long suffering public. When a wealthy monopoly stands ready with money and affidavits unlimited to prevent a competitor from getting a foothold in the field, it would by no means be an easy matter to prove an actual necessity for the establishment of a business. The public may be confident that a healthful competition would reduce the price of telephone service. It may be confident that the service is not all that it should be. The fact remains that the community could manage to exist without a competing line.

A corporation like the Bell monopoly, which in this particular case takes the form of the Southern New England Telephone Company, does not easily let go its hold on a community. It is strongly entrenched. The very fact that the Legislature was willing to pass such unjust laws is in itself evidence of the Bell power in politics. The Bell influence is widespread. Independents can expect no relief from the Legislature. The same power which secured the passage of these black telephone laws would operate to prevent their repeal.

On the other hand there is little hope of relief from the Superior Court. All judges are not corrupt; but the advantage of such a wealthy corporation is great. Its indirect influence on the courts cannot be estimated, and its direct influence is sometimes an insurmountable obstacle.

In this dilemma, on one or the other horn of which, Independent telephony is in imminent danger of being impaled, there is one loop-hole of sure escape. The telephone laws of Connecticut are special legislation of the worst kind and are in reality unconstitutional. They should be declared unconstitutional by the highest court in the State.

It will take money to fight such a case up through to the Supreme Court. A comparatively small company like the Farmington cannot be expected to go into this expensive litigation, important as it is. Independent companies outside the State can hardly be expected to do so. They have troubles of their own. It seems to THE AMERICAN TELEPHONE JOURNAL that, as a good business proposition, the manufacturers of telephone supplies throughout the country ought to combine for the purpose of testing the constitutionality of these Connecticut laws.

Once eliminate hostile laws from the situation in Connecticut, a wonderfully lucrative territory would be open to the Independent manufacturers. Connecticut has only eight counties, but it has one hundred and sixty-six towns with a population of a million people. The hum of business is heard throughout its borders from Monday morning to Saturday night. The telephone, under modern conditions, is as vital to industrial and commercial Connecticut as steam itself. Hostile law and that alone prevents Independent telephone companies from swarming over the State, from invading prosperous and populous towns, from stretching their network of wire and going to the relief of the people. To-day there are but eight towns with Independent service.

The middle West has been a great mine of riches to the Independent telephone manufacturers. The wonderful growth of Independent telephony in this territory has built up great factories, has given employment to thousands of people and an impetus to telephone industries which has been simply enormous. The population of New England is much more congested. With Connecticut well in hand, that whole section would fall in line, and a territory would be developed far more valuable to the Independent manufacturers than has been the middle West. This is not sentiment; it is business. The manufacturers have a great opportunity. Connecticut, with its hostile laws, has barred the progress of Independent telephony and the telephone industry long enough.

AN OPPORTUNITY FOR MANUFACTURERS.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

INDEPENDENT INTERESTS IN CONNECTICUT.

IN 1900 before a Superior Court judge at New London, Conn., an application was made by representative business men for a "finding of public necessity and convenience" to establish another telephone system in New London. The case was fought by the "Bell" interests successfully. While hundreds testified that another system was necessary on account of high rates, poor service, etc., the argument of the Southern New England Telephone Company (Bell) was that they were *willing* to supply all telephones required, *or that were necessary,* at a reasonable rate. They considered the rates reasonable, as their company was only paying 6 per cent. on their stock. The judge decided that another system *was not necessary.*

The Farmington Valley Telephone Co. started to build a line last fall over what is known as Town Hill, New Hartford, Conn. Two property owners held them up over the setting of five poles. The county commissioners were called upon, and, after a hearing, a location was given to set the poles along the highway on the disputed land. The company at once set the poles and strung the wire, establishing the desired connection. The property owners then took an appeal to the Supreme Court to have the line ordered removed. This hearing was held in January and was decided against the company, the court deciding that as the company was not in operation in New Hartford prior to May 3, 1899, the extension of their line was illegal. The same hearing was reopened in April to admit new evidence. Although the company claimed they were not doing an exchange business in that town, Judge Roraback decided against them, but issued no order pending further action on the part of the telephone company. Application was then made to the Superior Court for a finding of "public necessity and convenience" for the extension in question. Much to the surprise of the Farmington Valley people, no opposition was made to the application, only two witnesses being heard. The judge then granted the decree. This shows that in some sections of Connecticut some system is necessary other than the Bell, so that in time a footing may be secured even in Connecticut.

PLEADING IN TENNESSEE COURTS.

UNDER Shannon's Code, providing that defendant may enter a general denial of plaintiff's cause of action, equivalent to the general issue, a plea of not guilty in an action for wrongful death, in which it is averred that defendant negligently constructed and maintained its telephone wires in a dangerous manner, is not such an implied admission as relieves the plaintiff from showing that defendant had any connection with the construction or maintenance of the wires. Cumberland Telephone & Telegraph Co. v. Floyd (Tenn.), 79 S. W., 795.

VALIDITY OF EXCLUSIVE FRANCHISE.

H. L. MARAMAN brought suit against the Ohio Valley Telephone Company in the Bullitt circuit court of Kentucky for an injunction restraining the defendant from erecting poles and stringing telephone wires along the highways of Shepardsville, Ky., and thereby interfering with and encroaching upon his exclusive privilege or franchise of operating and maintaining a telephone system in that municipality. Upon final hearing, his preliminary injunction was dissolved and this judgment of the circuit court was afterwards affirmed by the Supreme Court. The original ordinance, authorizing the sale of the exclusive privilege was passed by the board of trustees of the city the same night it was introduced, and at a called meeting. The Kentucky statutes provide (Section 3699 of 1899) that "no ordinance or resolution granting any franchise, should be passed by the board of trustees within five days after its introduction, nor at any other than a regular meeting." The ordinance ratifying the sale of the exclusive franchise to the plaintiff was also passed at the same meeting in which it was introduced. The court held both these ordinances void because of these infirmities, and decided that being void, the plaintiff acquired no rights, exclusive or otherwise, to operate a telephone system in Shepardsville. Maraman vs. Ohio Valley Telephone Co. (Ky.), 76 S. W., 398.

NOT DOING AN EXCHANGE BUSINESS.

THE case of the Farmington Valley Telephone Company, of New Britain, Conn., against whom suit was brought by Seth Payne, of Town Hill, New Hartford, to have the company's line of poles removed, was reopened in the Superior Court to admit new evidence. The company contended that it was not doing an exchange business in Hartford under the telephone law of 1899, but operated an "interior" system. The principal testimony for the plaintiff was depositions of numerous Bell concerns. Their testimony was to the effect that they had never heard of an "interior" system. The defence introduced numerous witnesses, all of whom testified that an "interior" system was a common term, known to the telephone trade to distinguish between a system operated as an exchange having an operator and a system in which no central operator was employed. The judge reserved his decision. This case is of special interest to telephone men, as it is the first case brought under the infamous Connecticut laws of 1899.

CONTRACT WITH SUBSCRIBERS.

THE Atlanta Standard Telephone Company, at Atlanta, Ga., sued one Porter in a justice court upon an account for $16.80 for telephone service. The jury rendered a verdict for the defendant, who set up as a defence, failure of consideration. The case finally reached the Supreme Court of Georgia, where the judgment was reversed. The case turned upon the construction of a written contract between the parties wherein the defendant agreed to pay to the plaintiff, "as an annual rental for exchange service charges, the sum of $36.00, payable in quarterly instalments in advance for a period of five years." This contract also contained the following provision: "If the service is interrupted otherwise than by negligence or wilful interference of the subscriber, a rebate at the rate herein above specified, shall be made for the time such interruption continues after reasonable notice, in writing to the company. No other liability shall, in any case, attach to the company." The defendant testified that "the telephone was put in and remained in until this suit was filed," and that he "never gave the company any written notice of interruption of service before this suit was filed." The court held that the subscriber could not escape liability for the stipulated rental because of bad, improper, or useless service, without first giving to the company notice, in writing, of an interruption of service. Hence the court ruled that the admission of testimony on the part of the defendant tended to show bad, improper, and useless service, was an error for which judgment should be reversed. The court said that under this contract non-liability of the defendant for the rental and liability of the plaintiff to rebate the same, amounted to the same thing. It held that "interrupted service" must be construed to mean, not only a total cessation of a service once begun, but any service falling short of service reasonably suited to the purpose intended.

Atlanta Standard Teleph. Co. vs. Porter (Ga.), 43 S. E. 441.

IN THE OPERATING FIELD.

TOLL RATES IN SOUTHERN CALIFORNIA.

THE tariff question, which has been agitating Independent companies of the East for some time, appears to be handled very successfully by the Independent companies in southern California. The rate schedules are divided into seven different groups, which vary from 25 cents for three minutes to 25 cents for a quarter of a minute. In this way a party pays for only just such time as he talks. For instance, the rate between Los Angeles and Santa Barbara, distanced 125 miles, is 25 cents for the first quarter minute, 35 cents for a half minute and 50 cents for one minute. Below will be found a key to the rates, which will give some idea of how a successful solution has been found for toll rates:

Rate No.	¼ Min.	½ Min.	1 Min.	3 Min.	5c. each additional
1				25c.	½ Min.
2				15c.	1 Min.
3		25c.	40c.		½ Min.
4	25c.	35c.	50c.		¼ Min.
5	25c.	40c.	75c.		¼ Min.
6	25c.	50c.	$1.00		10 Sec.
7			25c.		½ Min.

It will be seen from the above schedule that the time limit has been reduced to the smallest practical value; so that in this way toll lines are kept free from delays, caused by parties using the line simply to use up the time when a flat rate of so much per three or five minutes, as the case may be, is used.

TAXATION IN WISCONSIN.

THE legal opinion of the city attorney of Stevens Point, Wisconsin, upon the action of the council in an effort to maintain a license tax on the poles of the Wisconsin Telephone Company is of interest in Milwaukee, inasmuch as Milwaukee recently took similar steps.

The attorney at Stevens Point advises the council that its move its not defensible; that in his opinion it would be futile to file an answer in the case, and, in fact, the telephone company has been advised to perfect judgment in the suit.

In the Milwaukee ordinance the telephone company is taxed one dollar per annum for each pole maintained in the city, and ten cents per year for each cross-arm used.

ARRANGEMENTS FOR TOUR OF FOREIGN ELECTRICAL ASSOCIATIONS TO ST. LOUIS.

THE American Institute of Electrical Engineers has made elaborate arrangements for the tour of the United States of foreign engineers and associations which will participate in the International Electrical Congress to be held at St. Louis during the week of Sept. 11. The programme so far outlined is as follows:

The tour will start from Boston Sept. 3. Visits will be made to the various power houses in Boston, to the Massachusetts Institute of Technology and to Harvard University; from there the company will go to New York and spend Sunday and Monday in New York City. Arrangements have been made whereby the party will be the guests of J. G. White & Company on a steamboat excursion up the Hudson or down to Coney Island. Excursions will be made to the power houses in New York City, and on the evening of the 5th a reception and dinner will be given by the American Institute of Electrical Engineers to all foreign visitors. Tuesday will be spent in Schenectady, where the party will be entertained by the General Electric Company. September 7 and 8 will be spent in Montreal, and Niagara Falls will be visited on the 9th, special excursions having been arranged down the Gorge, and visits will also be made to the power houses of the various companies whose power is furnished by the Falls.

Passing through Canada and the city of Detroit, Chicago will be reached on Saturday, Sept. 10, where the party will be the guests of the Local Reception Committee. St. Louis will be reached Sept. 11, when the party will be taken to the Hotel Jefferson, which will be the headquarters of most members of the association during their stay in St. Louis. The Congress will open at 9:30 A. M. on Monday, Sept. 12, and the proceedings until Saturday, Sept. 17, will be as already outlined.

The train will leave St. Louis at 8 P. M. on Saturday, Sept. 17, and will arrive in Pittsburg at 3 P. M. Sept. 18. On Monday special cars will take the visitors to the offices and works of the Westinghouse Electric & Manufacturing Company. After visiting these works the party will be guests of the Westinghouse Electric & Manufacturing Company at luncheon. In the afternoon, visits will be paid to the Edgar Thompson Steel Works and to the foundries of the Westinghouse Air Brake Company. Tuesday, Sept. 20, will be spent in Washington, and on the 21st the party will visit points of interest in Philadelphia, leaving there the same afternoon for New York.

The American Institute of Electrical Engineers has gotten out a programme of the tour, which deals very thoroughly with railroad and hotel rates and also with a general outline of the tour. The cost of a ticket for this special tour, including railroad fares, sleeping car berths, hotel accommodation, including time spent in St. Louis, meals and all necessary expenses from New York and back, will be $150. This rate, however, does not include hotel expenses in New York City or the expenses of the Boston trip previously referred to, and does not include the admission to the grounds of the Louisiana Purchase Exposition.

ELGIN TAXES CHICAGO TELEPHONE COMPANY.

THE city of Elgin, Ill., is preparing for its legal battle with the Chicago Telephone Company, in which it is endeavor- to compel that corporation to pay a tax of one dollar on each telephone in use in that city. Should the city win its its suit, an attempt will be made by other cities to place a tax on such instruments, and the telephone people will put up a hard fight and carry the question to a court of last resort.

The company holds that it already pays a tax on the instruments as personal property and that it would simply mean submitting to double taxation. The city, on the other hand, insists that the charge is in the nature of a license for the use of the telephones and the law is as legal as is the law to license a peddler's wagon after a personal tax has been paid on the wagon itself.

A PROSPEROUS GEORGIA COMPANY.

THE report of President W. A. Bisbee of the Georgia Telephone and Telegraph Company, at the annual meeting of the stockholders, showed that the last year was one of the most prosperous in the history of the corporation.

An increase of gross earnings amounting to $5,060.87 was shown, with a decrease in operating expense of $2,450. For improvements in the way of new pole lines, additions to the switchboards, installing new telephones, replacing overhead wires, taking out old cable terminals, and the like, nearly $18,000 had been spent, bringing the system up to a high state of efficiency.

The report showed that there were in use 2,264 stations, a substantial increase over the number for the year before.

Two achievements noted were the putting in of a Georgia

Digitized by Google

switchboard at the Southern Cotton Oil Works, carrying twenty-eight instruments, and the contract for putting in a switchboard at the De Soto, with a capacity of 280 telephones, 255 of which are to be installed at once, in the rooms of the hotel.

A semi-annual dividend of $3 per share and of 3 per cent. on the stock debentures was declared, distributing about $8,000 among the stockholders.

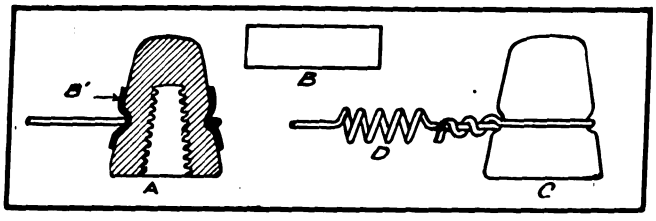
The following officers were re-elected: President and general manager, W. A. Bisbee; vice-president, J. H. Estill; treasurer, C. S. Kenyon; secretary, W. V. Davis; W. A. Bisbee, L. Adler, W. W. Mackall, J. H. Estell, H. Myers, H. P. Smart and J. Paulsen, directors.

TO INVESTIGATE TELEPHONE SYSTEMS.

THE matter of granting a franchise to the Newport (N. H.) People's Independent Telephone Company is now held up for the purpose of making an investigation of independent telephone lines elsewhere. A commission is to be chosen by the selectmen for that purpose, and the expenses of the investigation are to be paid by the parties interested.

MEANS TO STOP HUMMING.

THE following ideas are suggested to stop humming. Each has been tried and found satisfactory: The method illustrated at Fig. *A* is to take a piece of rubber, *b*, long enough to go around the insulator, and place it in the groon as shown at *b'*; then put on the wire and fasten in the usual manner.



The other method is to make a spiral of the line wire about two feet long and arrange it to be about ten feet from the insulator. This method has the additional advantage that it tends to take the strain off the insulator during a high wind, and consequently it is not so liable to be broken or pulled off. This method is shown at *d* in Fig. *C*.

SOUTHERN CALIFORNIA NEWS.

THE Home Telephone Company, of Longbeach, Cal., has begun the work of installing a complete central energy system that will have an ultimate capacity of 1,000 lines, 300 of which will be equipped at once. The plant will be in operation about Nov. 1.

San Pedro is situated on the opposite side of the bay, and possesses a fine natural harbor, upon the improvement of which the Government has spent nearly $2,000,000. The future of this city, in view of the Panama treaty, is very bright. At present there is but one toll line to Los Angeles, but as soon as the business warrants others will be constructed.

COMPETITION LEADS TO BANKRUPTCY.

THE first meeting of the creditors in the bankruptcy of Dr. A. W. Chamberlain of Stratford was held at Webster City, Iowa, recently. The doctor's liabilities are about $10,000 and his assets about $4,000, of which a large part is exempt. The hearing was held before W. J. Covil, referee in bankruptcy for this district.

Dr. Chamberlain's venture in the telephone business was in opposition to the E. H. Martin Company, which maintained a system at Webster City, Iowa. The reason for this competition is not clear, since the E. H. Martin Company was thoroughly Independent; however, the Chamberlain Telephone Company was organized and some plants installed. The service given did not realize the hopes of the investors and patrons, and finally the Webster City and other plants were discontinued. Eventually the whole, including the franchises, was sold to the Hamilton County Independent Company for $6,000.

The size of the claims which soon began to be pushed against Dr. Chamberlain forced him into bankruptcy, which proceedings are now in the course of litigation. The $4,000 in assets which the doctor holds includes his home, medical library, team, etc., which will be exempt in the bankruptcy and cannot be taken by the creditors. The latter will probably realize but a few cents on the dollar.

INTERESTING FACTS FROM SALT LAKE CITY.

THE recently opened exchange of the Utah Independent Telephone Company in Salt Lake City started with 1,600 subscribers and now has 1,800. New contract are coming in at an average rate of 40 per day without any soliciting. The information bureau is especially noticeable, for in addition to many other innovations, it is furnishing all the hotels, etc., with accurate and timely train reports up to the minute, giving them a card to keep the report on.

The service of the Rocky Mountain Bell Telephone Company, says the *Daily Reporter* of Salt Lake City, has been worse, if possible, since the Independent Company commenced, than it was before. A wait of one or two minutes before the operator answers is not unusual, and when a connection is made, it is likely to be with the wrong number as not.

One reason for this is that all the best operators are going over to the new company, attracted by higher wages and a chance to better general conditions. This, as much as anything else, will cause the old company to come into disfavor with the public.

A business concern that allows a rival company to do this for the sake of a few dollars is as good as lost. The Independent company could ask nothing better than a policy of this kind on the part of the Bell people. The company that has the best operators and workmen will give the best service, and the company that gives the best service will get the business.

THE BELL IN MISSISSIPPI.

IN a report from Jackson, Miss., the methods of the Cumberland Telephone Company are once more brought to light. Chancellor Robert Mayes, of that district, has filed with the Railroad Commission a bill of complaint against the Cumberland Telephone & Telegraph Company. The bill sets forth that up to the beginning of 1899 the Cumberland Company had an exchange in the town of Hazelhurst, while there was a local system in Hazelhurst reaching Jackson, Macomb City, Point Gibson, Utica and other points, including Brown's Wells. The company bought out the local system and allowed it to go out of existence.

The complaint sets forth that the Cumberland Company allowed the line to Brown's Wells to get in very bad repair, and although it remained that way for a long time, yet continued to collect tolls. When a subscriber threatened to make a complaint the telephone company threatened to cut out the line. The bill goes on to state that this course of conduct has been going on for several years, and the people subscribing for the telephones are getting tired of this kind of intimidation. The Railroad Commission is asked to come to the relief of the subscriber and compel the Cumberland Company to keep up its line.

TELEPHONE OPERATORS IN GERMANY.

IN the German telegraph and telephone service all grades of positions are open to women, though the rules of admission are very strict, and no women with children are employed. Four thousand women are now engaged in the telephone service of the German Empire, it is stated, 1,000 of them being in Berlin. The hours are light, ranging from six to eight a day.

The highest pay which a woman can draw in German telephone offices is $357, which is said to afford a comfortable living in Germany, but is a low wage compared to that obtained in England, where experienced telephone clerks get $600 and chief supervisors are paid as high as $1,550. In Germany, however, it must be noted that women on their withdrawal from active labor after the prescribed number of years of faithful work are awarded a Government pension on the same plane with men.

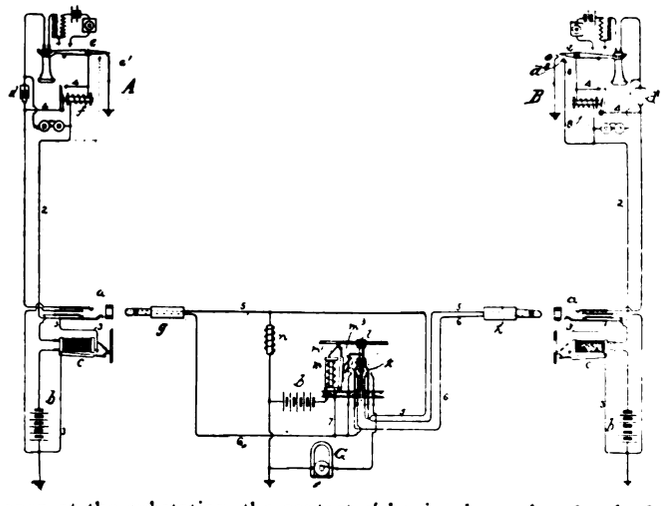
TELEPHONE PATENTS

SIGNALLING SYSTEM FOR TELEPHONE EXCHANGES.

C. E. Scribner, of Chicago, Ill., patents (No. 763,803) and assigns to the Western Electric Company, of Chicago, an improved signalling system. This is shown in the accompanying illustration and is best understood by a description of its operation, which is as follows: The subscriber signals by removing the telephone. As the switch-hook *e* rises it touches the contact *e'*, sending an impulse through the line, exciting and displaying the signal *c*. When the disc of this signal rises it short-circuits the line and is locked in its former position, when the operator observes the signal she inserts the answering plug, obtains the order and replaces the plunger *l* to transmit a call signal. The insertion of the answering plug separates the line springs, cuts off the battery *b* and signals *c*, breaking the local circuit *3* so that the line signal is restored and battery *b* is connected to the line through the plug-circuit, said battery being bridged between conductors *5* and *6*, with the impedance coil *n* on one side and the magnet *m* on the other side. The plug and spring jack are so constructed that the sleeve of the plug which is connected with the free pole of the battery will not touch the longer line spring until said spring has been raised from its contact so as to cut off the line signal. The magnet *m* will not receive current when the answering plug is in the circuit, because the circuit of that line is



open at the substation, the contact *e'* having been closed only for an instant. When the plunger *l* is depressed the ringing springs are connected to the line and ringing current supplied. When the called party answers, the circuit of conductor *2* is momentarily closed at contact *e'* and an impulse from battery *b* flows over the circuit, energizes magnet *m* and draws up its armature. The detent *m3* is thus released and the ringing key tripped and returns to its normal position. This breaks circuit of the battery and generator. As soon as the sprinks *k k'* touch their inner contacts the battery is again bridged. During the interval of time while the springs *k k'* are returning to their normal position, the battery is cut off, the relay *f*, which may have been drawn up, will fall back, leaving the line circuit open. The ringing key must be designed to act sluggishly so that the armature of relay *f* will have time to be retracted before the springs *k k'* sever their contacts. When either subscriber replaces his receiver, the switch lever closes the circuit momentarily and relay *f* is drawn up and is not short-circuited, the bridge *4* remains closed so that the battery will flow continuously over the line and display signal *m'*.

TELEPHONE FIRE ALARM SYSTEM.

W. L. Denio, Rochester, New York, patents (No. 762,391) and assigns one-half to Hobart F. Atkinson, of Rochester, an improved fire alarm system. The essential features of this system consist in locating one or more thermostats in various parts of the building to be protected in a circuit or circuits, each one communicating with the telephone circuit and connected with an electromagnet arranged to be energized by the closing of the circuit by the thermostat. This magnet unlocks the vibrating pendulum driven by an escapement wheel which operates at *V* which projects up, touching the lever *W*, and sends a series of

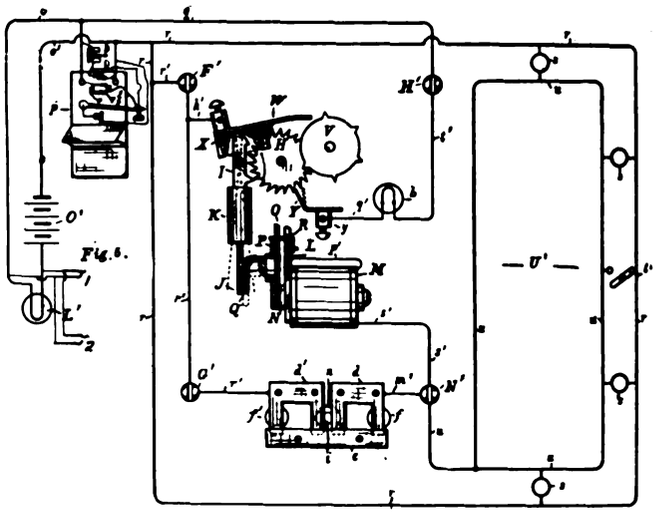


Fig. 6.

impulses to the central office. These impulses act upon the signal lamp and causes it to flash as many times as there are projections in the wheel *V*. These projections operate in this manner to convey to the operator a number indicative of the point at which the thermostat is operated and by this means may be interpreted as a signal of fire.

IMPROVED LAMP JACK.

W. Kaisling, of Chicago, Ill., patents (No. 763,404) and assigns to the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., an improved lamp jack. The object of the invention is to provide an improved lamp jack, which the inventor accomplishes in the following manner: Fig. 1 is a front elevation.

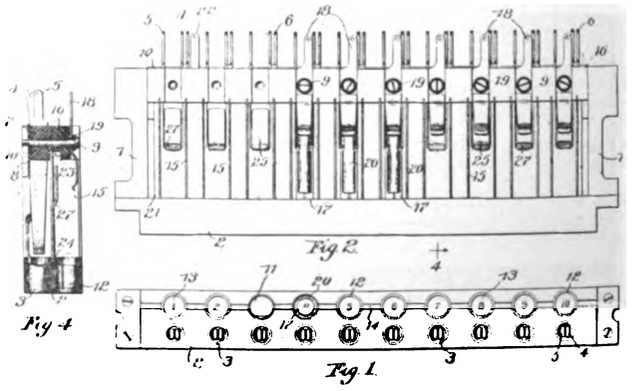

Fig. 4

Fig. 2.

Fig. 1.

There is a front piece *2* to which the thimbles of the lamp jacks and the telephone jacks are secured. The telephone jacks are arranged in the ordinary manner, and consist of a set of springs which are held in insulating strips *7* and *16* (Fig. 4.) The essential feature of the lamp jack consists of a base plate which extends from one end to the other of the bank. This base plate is shown at *24* in Fig. 4. In the base plate a series of springs *27* are punched, and thus one terminal of all of the lamps becomes common and is connected to the battery in the proper manner. The other terminal consists of an individual spring *15* for each lamp and is secured by means of the screw *9* to the rear insulating strip *10*.

QUERIES

Questions on any subject relating to telephony will be answered on this page.

DYNAMOTOR—MOTOR GENERATOR.—(379.)

Please explain the difference between a dynamotor and a motor generator. E. H. C.

The sketches, Fig. 379a and 379b, show roughly the main constructional points of difference. Fig. 379a is the dynamotor and 379b is the motor generator. A dynamotor is a machine, a combination motor and dynamo, for changing current from

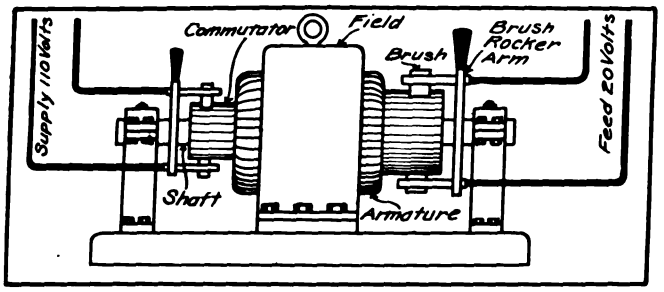

Fig. 379a.

one voltage to another, and has but one magnetic field, in which the armature windings of both the primary and secondary circuits revolve. Usually both of the windings are on the same armature, but sometimes they are on separate armatures. On account of the neutralizing action of the motor and dynamo armature windings there is no field distortion; consequently a shifting of brushes is not required with a change of load.

These machines are more efficient than motor generators, as there is but one field winding to consume energy; but they cannot be compound wound to insure a steady voltage at the dynamo end, as the effect of such compounding would be to lower the motor speed. For these same reasons it is not possible to regulate the dynamo voltage by field regulation, as any change in field strength would change the motor speed. The only way to regu-

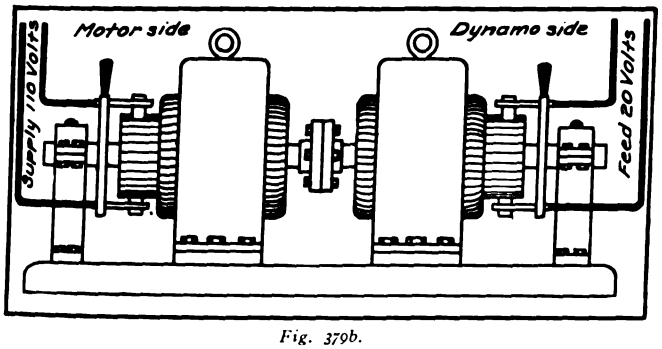

Fig. 379b.

late voltage with a dynamotor is to insert resistance in the main circuit, which is very wasteful. Where voltage regulation is desirable dynamotors are not.

A motor generator is an arrangement for transforming voltage, and consists of two entirely separate machines, a dynamo and a motor, with their armatures on the same shaft. Any winding can be applied to the dynamo, and any system of field regulation may be used, as the machines are as distinct as if they were belted together and were in separate buildings. Motor generators for storage battery charging are usually shunt wound. The drawings show an instance where current is received at 110 volts and delivered at 20 volts.

SLOT MACHINES.—(380.)

Will coin slot telephones work on a grounded line, or must it be metallic? Some lines will be 20 miles long with 10 or 12 telephones to a line. J. C.

This depends entirely upon the type of slot machine you are considering. A large proportion of the slot machines manufactured to-day give the signal by means of a sound. In this case an operator is required to listen for the signal when the coin is deposited in the slot. This type of instrument being entirely mechanical, it makes no difference as to whether the circuit is grounded or metallic.

There are other devices which are not coin collecting machines, but are meters of one description or another, which to be successfully operated require metallic circuits. This is due to the fact that a difference of potential may exist between the point where the line is grounded and where the exchange is situated, which would tend to neutralize the effect of any current sent over the line to operate the meter.

SIMPLEX COILS.—(381.)

In regard to impedance coils in simplex circuits (334), May 21 number, what should be the resistance of the two windings in series, what size wire, and what kind and size of core, for use on a bridging circuit with 1,600-ohm ringer magnets, should a coil as described above have? R. T. S.

The coil in question, a cross section of which is illustrated in Fig. 381, has four windings of 2,400 turns each of No. 29 silk covered wire, coil No. 1 inside and coil No. 4 outside, connect together to form one-half, which gives 4,800 turns and a resistance of 120 ohms. Coils No. 2 and No. 3, both middle coils, are connected together to serve as a second half, also give 4,800 turns and a resistance of 120 ohms. The core is made up of annealed iron wires 13½ inches long bent back over the winding so as to overlap and form what is sometimes called a hedge-

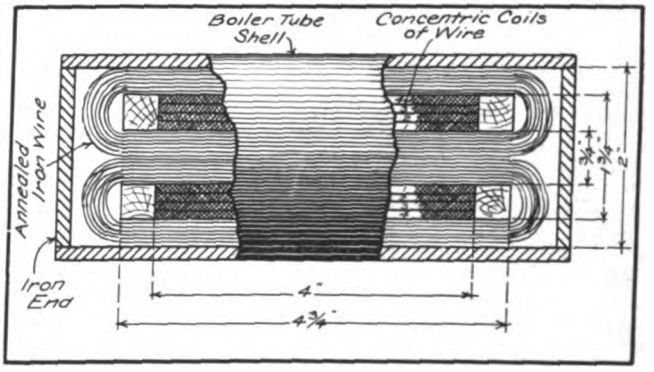

Fig. 381.

hog transformer. A shell of boiler tube encloses the completed coil and serves as a shield for the magnetic lines which would otherwise cross talk in adjacent coils. The impedance of this coil will be great enough to allow it being placed in a bridge circuit with 1,600 ohm ringers, regardless of the low resistance of its two windings in series, 240 ohms. If the wire is wound parallel two spools of No. 29 wire will be necessary to wind from; the wire, being wound side by side for the 4,800 turns. This will give the best balance, but is rather difficult to wind and is more liable to break down as two wires of the two coils are side by side for their entire length.

GRAVITY CELL.—(382.)

I would be glad to know whether or not the deposited copper should be cleaned off the copper element of gravity cells when renewing. Give reasons for answer given. L. S.

As the positive element of a gravity cell is of copper, and as the deposit that accumulates on it during the action of the cell is also copper of the purest description, there is no necessity of cleaning off this deposit when the cell is renovated, but the copper which is deposited is likely to be brittle, so that particles may be dislodged and accumulate on the zinc. This causes local action, and for this reason it is desirable to brush the copper with a stiff wire brush when the cell is cleaned in order to dissolve any loose particles.

THE WEEK'S MESSAGES

FINANCIAL.

SAVANNAH, GA.—The Georgia Telephone and Telegraph Company has declared a semi-annual dividend of $3 per share and three per cent. on the stock debentures.

OBERLIN, KAN.—The Central State Telephone Company, incorporated with a capital stock of $60,000, paid a three per cent. quarterly dividend for the quarter ending June, 1904. This is at the rate of twelve per cent. per annum.

PATCHOGUE, L. I., N. Y.—The Suffolk County Telephone Company has increased its capital stock from $3,500 to $13,500.

CRAIG, MO.—The Craig Telephone Company will vote on a proposition to increase its capital stock.

LACONIA, N. H.—At a recent meeting held by the directors of the Citizens' Telephone Company, a semi-annual dividend of three per cent. was declared.

TROY, N. Y.—The Commercial Union Telephone Company has increased its capital stock from $10,000 to $800,000.

FRANCHISES.

SANTA ANA, CAL.—W. L. Porterfield has applied to the Board of Supervisors for a long-distance franchise for the Home Telephone Company.

ARCADIA, KAN.—The application of the Arcadia Telephone Company for a charter has been granted. The company now has a paid-up capital of $1,250.

ST. LOUIS, MO.—The St. Louis County Telephone Company was given a franchise to erect poles and string wires throughout the county.

HASTINGS, NEB.—The City Council has unanimously voted to grant a thirty years' franchise to the Hastings Independent Telephone Company. Wires in the business portion of the town will be placed underground.

MANITOWOC, WIS.—The Manitowoc Telephone and Telegraph Company has applied to the City Council for a franchise.

COMBINATIONS.

VINITA, IND. TER.—The Indian Territory Telephone Company, with headquarters at Vinita, has sold its local exchange to the Pioneer Telephone Company, Oklahoma City.

MOULTON, IA.—W. C. Stickney has sold his Moulton telephone lines to Clyde Mann, of Woodbury County.

GARDEN CITY, KAN.—Mr. Menke has sold his interest in the Garden City Telephone Exchange to E. L. Wirt.

SALINA, KAN.—The Salina Telephone Company has purchased the Lindsburg and Marquette exchanges, together with connecting toll lines in McPherson, Ellsworth, Rice, Barton and Salina counties. The capital stock of the company has been increased to $100,000. Many improvements and extensions will be made.

MONROE CITY, MO.—The Monroe City Telephone Company has sold its plant to the Buffum Telephone Company.

WEATHERFORD, TEX.—The O. R. Riddle Telephone Company has sold out its entire business to J. G. Brannon and William E. Burke.

POINT PLEASANT, W. VA.—The Point Pleasant Telephone Company has purchased the property, plant and good will of the Mason County Telephone Company.

ELECTIONS.

SAVANNAH, GA.—The annual meeting of the Georgia Telephone and Telegraph Company was held, at which the following officers were elected: W. A. Bisbee, president; J. H. Estill, vice-president; C. S. Kenyon, treasurer; W. B. Davis, secretary. Herman Myers, L. Adler, Jacob Paulsen, H. P. Smart, W. W. Mackall, W. A. Bisbee and J. H. Estill, directors.

BUCYRUS, O.—At the annual meeting of the Bucyrus Telephone Company the following officers were elected: Dr. John A. Chesney, president; H. S. Blair, vice-president; J. F. C. Hull, secretary and treasurer. Dr. John A. Chesney, E. Blair, J. F. C. Hull, Benjamin Shearer, W. H. Miller, H. S. Blair and W. A. Blicke, directors. Albert Unger was appointed manager.

PIQUA, O.—The Miami Valley Telephone Association has elected the following officers: A. F. Bromhall, of Troy, president; Dr. Kessler, West Milton, vice-president; Col. W. D. Rush, Greenville, secretary and treasurer; I. H. Thediceck, L. E. Simes, L. M. Flesh, executive committee.

CALIFORNIA, PA.—At the annual meeting of the stockholders of the Union Telephone Company, the following officers were elected: W. C. Smith, president; T. J. Underwood, vice-president; A. F. Moses, secretary, and H. L. Lamb, treasurer and manager. The directors are W. C. Smith, L. J. Underwood, A. F. Moses, H. L. Lamb and L. F. Baker.

POINT PLEASANT, W. VA.—At a recent meeting of the stockholders of the Point Pleasant Telephone Company the following officers were elected: W. M. Haynes, president and general manager; E. J. Mossman, vice-president; T. Stribling, secretary and treasurer; J. S. Spencer, attorney. E. J. Mossman, T. Stribling, J. S. Spencer and E. B. Jones, directors.

UNDERGROUND.

NEW CASTLE, PA.—All electric, telephone and telegraph wires will be placed underground.

PERSONAL.

W. B. BENTLEY, superintendent of exchanges of the Cincinnati & Suburban Telephone Company, has resigned; he is succeeded by J. E. Peavey.

ALFA EVANS has been appointed manager of the Whitewater exchange of the Wisconsin Telephone Company.

O. J. HAWKINS, connected with the Home Telephone Company, of Cohoes, N. Y., was the lucky winner of a drawing for a free trip to St. Louis.

BARTON JONES has been appointed manager of the Moody exchange of the Southwestern Telephone and Telegraph Company.

CHARLES KESTER has been appointed secretary and manager of the People's Mutual Telephone Company, at Hillsboro, Ill.

MAX STADT, the fuse inventor, has organized a company at Los Angeles to be known as the Los Angeles Tool and Die Manufacturing Company.

MELVIN SAUNDERS has been appointed manager of the Valley Telephone Company, of Bay City, Mich.

A. L. WATERBURY, formerly vice-president and general manager of the Citizens' Telephone Company, Houston, Tex., has accepted the position as general manager of the sales department of the American Conduit Company. Mr. Waterbury will have his headquarters at the Chicago office of this company, 1005-1006 Manhattan Building.

MISCELLANEOUS.

LOS ANGELES, CAL.—The material for the completion of the Home Company's exchange has arrived and work will be pushed to completion, which will be about August 1st.

COVINGTON, GA.—The Covington Telephone Company's exchange was destroyed by fire recently.

CLINTON, ILL.—Lee Summers has a new telephone line up as far as Liberty.

MOLINE, ILL.—The Union Electric Company, of Moline, has been awarded the contract for the installation of telephones of the public schools in the city.

TULSA, I. T.—The Indian Territory Telephone Company, with headquarters at Vinita, has sold its local exchange at this place to the Pioneer Telephone Company, of Oklahoma City, for a consideration of $10,000. The purchasers will enter upon the business at once. The trade carries with it the business of three long-distance lines centering here, with connections in Texas, Oklahoma, Missouri and Kansas. The system is a central energy and one of the finest in either of the two territories. Less than two years ago it was purchased from other parties for less than $6,000. It has been on a paying basis ever since.

COUNCIL BLUFFS, IA.—A special telephone committee of the Commercial Club has reported to the directors that there is plenty of money in sight to back a mutual telephone company that will connect with the Independent lines entering the city.

ALMA, MICH.—The Union Telephone Company will spend $50,000 in enlarging its system.

NORTHFIELD, MINN.—At a meeting of the Common Council, the Tri-State Telephone and Telegraph Company was granted permission to run its line to the city and establish a toll station.

KANSAS CITY, MO.—The Home Telephone Company's plant sustained considerable damage by the recent floods.

KANSAS CITY, MO.—All telephone and telegraph companies having lines in this city have been notified that they are not to put in any more anchor poles. They will have to devise some other means of anchoring their poles.

VANDALIA, MO.—The farmers owning the rural lines coming into Vandalia held a meeting recently and decided to install and operate a switchboard here.

UTICA, N. Y.—Because of remarkable success in securing contracts, the Utica Home Telephone Company has secured larger quarters for its switchboard at Whitesboro, four miles west of Utica. The change was made in eight hours and forty-one minutes, the number of lines entering the switchboard being 225.

TYRO, O.—About thirty telephones were burned out during the thunderstorm last week.

MITCHELL, S. D.—F. B. Else has sold out his interest in the local telephone exchange.

NEW COMPANY NOTES.

ALBION, ILL.—The Edwards County Mutual Telephone Company has been organized with a capital stock of $8,000.

MAYVIEW, ILL.—Farmers in this vicinity held a meeting for the purpose of organizing a farmers' telephone company.

SHELBYVILLE, ILL.—The Rose Township Mutual Telephone Company, of Shelbyville, has been incorporated with a capital stock of $1,020, by Philip Roesler, George Ruff and Jacob Kull.

TAYLORVILLE, ILL.—The Taylorville Home Telephone and Telegraph Company has been incorporated with a capital stock of $75,000, by Henry W. Carter, George E. Waldo and C. M. Smith.

WILMOT, IND.—The Wilmot Mutual Telephone Company has been organized with a capital stock of $10,000. It will absorb the Etna Telephone Company, and will have direct connection with Etna, North Webster, Cromwell, Ligonier, and the lake resorts of that region.

Digitized by Google

ADAIR IA.—The Grant & Audubon Township Mutual Telephone Company has been incorporated with a capital stock of $3,000.

BOW CREEK, KAN.—The Bow Creek Telephone Association has been incorporated with a capital of $2,000, to give telephone service to the towns of Bow Creek, Marvin and Stockton. The officers are: Evan Hebrew, president; J. M. Elliott, vice-president; E. A. Stroup, secretary, and J. A. Hebrew, treasurer.

DENISON, KAN.—The Broken Arrow Telephone Company has been incorporated with a capital stock of $5,000.

FRANKFORT, KY.—The Big Leather Wood Telephone Company has been incorporated with a capital stock of $2,500.

RANDOLPH, KY.—The Randolph & Hiseville Telephone Company has been incorporated with a capital of $500, by L. B. Strader, J. H. Owens and E. Evans.

SHAKOPEE, MINN.—The Farmers' and Merchants' Telephone Company, of Shakopee, has filed articles of incorporation. The capital stock is $10,000.

BOONEVILLE, MISS.—The Citizens' Electric Light and Telephone Company, of Booneville, has been incorporated with a capital stock of $2,000, by J. V. Sanders, L. N. Phillips and others.

LEETON, MO.—The West Lawn Telephone Exchange has been incorporated with a capital stock of $2,000.

SHELBYVILLE, MO.—The Windsor & Okaw Mutual Telephone Company has been incorporated with a capital stock of $900, by J. W. Herron, J. H. Haste and J. F. Morse.

NEWPORT, NEB.—The Farm and Home Telephone Company has been incorporated with a capital of $5,000, to give telephone service to the towns of Newport, Simpson, Brocksburg, Jamison, Naper, Butte and Anoka. The officers are G. E. Van Every, president and manager, of Newport, and C. M. Thompson, vice-president, secretary and treasurer, of Newport.

CAYWOOD, N. Y.—The Caywood & Lodi Telephone Company has been organized to build a new line from Valois to Lodi and Interlaken.

FITTSTOWN, N. Y.—The citizens of this town held a meeting for the purpose of forming the Farmers' Telephone Company of Fittstown. The following officers were elected: Ernest Abbot, president; Ira Haner, vice-president; J. Van Wert, secretary, and Clarence Herrington, treasurer.

SALISBURY, N. C.—A new telephone company will be organized here. The company is selling its stock rapidly and expects to begin operation very soon.

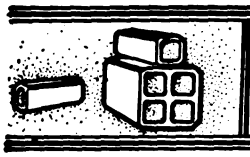
CARROLL, O.—The Carroll Telephone Company has been incorporated with a capital stock of $5,000 by O. B. Brandt, J. P. Gundy, H. A. Brown, J. W. Ash and T. P. Sylvester.

CHATHAM, O.—The Chatham Farmers' Mutual Telephone Company has been incorporated with a capital of $10,000, to give telephone service to Chatham and surrounding country. The officers are: A. B. Horst, of Spencer, president; P. H. Homan, of Medina, vice-president; W. H. Ripley, of Chatham, secretary; A. R. Clapp, of Medina, treasurer, and L. S. Rogers, of Chatham, manager.

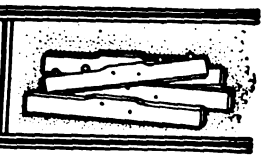
SALEM, O.—The Salem Township Rural Telephone Company has been incorporated with a capital stock of $2,000, by H. A. Halverstadt, E. H. Simon, H. V. Zimmerman and D. W. Brinker.

FREDERICK, OKLA.—The Southern Oklahoma Farmers' Telephone Company, of Frederick, has been incorporated with a capital stock of $20,000, and will construct rural lines covering this section of the country.

CHIPPEWA FALLS, WIS.—The Melville Settlement Telephone Company has been organized. Its purpose is to build lines and connect to the Wisconsin Telephone Company's lines all the farming community. James W. Melville is president and John W. Melville secretary.



New Construction in the Field



LOS ANGELES, CAL.—The Home Telephone Company is contemplating extensive additions to its service.

HOPEDALE, ILL.—The Mutual Telephone Company has received its cable and is overhauling its system here.

PALMYRA, ILL.—The Lee County Telephone Company is rebuilding its line on account of inductive disturbances caused by the trolley road.

PRINCETON, ILL.—An Independent telephone line has put in about a mile and a quarter of cable at the south end of Princeton.

ROCKFORD, ILL.—The Winnebago County Telephone Company will extend its service into Pecatonica.

WOODLAND, ILL.—The Woodland Telephone Company has its line completed to Eden.

WALNUT, IA.—The Musson Telephone Company has completed two new lines southeast of town and connected them to the Walnut exchange.

WINTERSET, IA.—The Hawkeye Telephone Company will erect a two-story building for its central exchange.

FULTON, KAN.—The Osage Valley Telephone Company, of this city, is now working on a six-mile extension of its line, northeast from Mapleton, Kan.

LEAVENWORTH, KAN.—The People's Telephone Company is preparing to expend $30,000 in equipping its system here with the most modern and up-to-date service and instruments.

WICHITA, KAN.—The Missouri & Kansas Telephone Company will install an entire new local system here.

NEW IBERIA, LA.—The People's Independent Telephone Company, Ltd., R. F. Hogsett, proprietor, is extending its pole line from New Iberia to Derouen, a distance of about twelve miles; also from Erath to Bayou Figre.

BANGOR, ME.—Construction on McFaul's telephone line is being pushed rapidly, and it is expected that the full twenty-eight miles will be in working order by the first of August.

BELGRADE, MINN.—A telephone line is to be erected from here to Games Lake.

LUVERNE, MINN.—Work will soon commence on the Springwater-Garretson telephone line.

MARION, MINN.—A telephone line is to be built from Marion to Litchville.

WOONSOCKET, MINN.—The farmers of this town will build a line from this city to Storia and from Storia to Letcher.

FRANKLIN, N. H.—The Citizens' Telephone Company is preparing to build a line up to Hodgdon district. Some new cable construction is also contemplated by the company.

CANASERAGO, N. Y.—A new telephone line will be built from Arkport to this place, connecting with the Interocean line at Arkport. The officers of the company are: Jacob Schwangle, president; Albert Schmill, vice-president; Frank Wilkins, secretary, and Gibbon Manley, treasurer.

HAMBURG, PA.—The Pennsylvania Telephone Company contemplates making extensive improvements to its line between Hamburg and Windsor Castle. New poles will be erected and the entire line will be rewired.

HARRISBURG, PA.—The Pennsylvania Railroad Company is installing a telephone system here to connect with all the offices and departments of the company.

READING, PA.—The Consolidated Telephone Company will expend $100,000 in improvements in Reading and vicinity. A line will be built from Reading to Lebanon and another will be extended from the Conestoga Valley.

WESTERLY, R. I.—The Automatic Telephone Company was granted permission to set poles to Weekapang under the supervision of the Highway Committee.

ABERDEEN, S. D.—The Dakota Central Telephone Company has completed the construction of the new metallic copper circuit between Aberdeen and Sioux Falls.

CANISTOTA, S. D.—The Canistota Telephone Company is contemplating running a new line to connect with the line running from Montrose.

WHEELOCK, TEX.—W. C. Covington and C. Joese will build a line from here to Bryan, a distance of sixteen miles.

WILDROSE, WIS.—The Waushara Telephone Company will build a line from Wildrose to Wautoma to give direct connection between this place and to give farmers along that route telephone service.

ROME, N. Y.—The Rome Independent Telephone Company is planning to make several improvements in order to cope with increasing patronage. Two new sections of the switchboard will be made and 20,000 feet of aerial cable will be strung. At present the company has 1,100 subscribers and several contracts signed, but the telephones have not been placed because of limited accommodations.

CLIFFORD, N. D.—The Trail County Telephone Company is putting in a new exchange at this point.

PORTAL, N. D.—Mark Shanks will install a local telephone system.

CLINTON, O.—The Clinton Telephone Company has arranged for the construction of several new lines.

RAVENNA, O.—The Portage County Telephone Company will build twenty-five miles of line in the extension of its system to Rootstown, New Milford, Edinburg, Atwater Station and Randolph.

INGERSOLL, OKLA.—The Union Telephone Company, of Ingersoll, will build a toll line to Byron.

FLORENCE, ORE.—Fred C. Bean, T. J. Neeley and Charles Saubert will construct a new telephone line from Florence to Mapleton. It will connect with the line which runs from Acme to Florence. The new line building from Junction will connect with the line at Mapleton, thus giving connection with Eugene.

PHILOMETH, ORE.—Construction has started on the Independent line running from this town to Corvalis.

FORESTBURG, S. D.—A telephone line is being constructed from here to Ruskin Park, to be connected with the local system.

CONCORD, TEX.—The Dinana Brick and Tile Company is arranging to build an Independent telephone line from Concord to Beaumont.

ELCAMPO, TEX.—A telephone line will be constructed from Markham to this place.

SHARON, VT.—The Rapid Telephone Company is extending its lines from Sharon to Lake Mitchell.

EVERSON, WASH.—The Bellingham Bay & British Columbia Railway Company is constructing a private telephone line from Hampton and Everson to Lynden.

QUINCY, WASH.—The Babcock-Benson Telephone Company has nearly completed its line from here to Wilson Creek City. A line will be run north to Farmer, Wash.

WILBUR, WASH.—L. Larick and associates have organized the Sans Poil Telephone Company and are building a line from here to Sans Poil, Idaho.

FAIRMOUNT, W. VA.—The Fairmount Telephone Company is building a line between Morgantown and Cheathaven, which will eventually connect with the People's line and give service to Uniontown and various parts of Fayette and Green counties.

BLACK RIVER FALLS, WIS.—The Pierce County Telephone Company is reconstructing its toll lines north of this city.

LARAMIE, WYO.—A new telephone line has been built from Laramie to Rambler Mine, at Douglas Creek.

TRADE NOTES

THE ELECTRIC APPLIANCE COMPANY, of Chicago, reports an unprecedented demand for its No. 36 X. P. type telephone. This is the instrument which the company guarantees, on a line equipped with twenty of them, to ring the twentieth with eighteen receivers down.

THE MONARCH ELECTRIC AND WIRE COMPANY, of 125-127 South Clinton street, Chicago, is the exclusive Western agent for the "Pneumatic Telephone Receiver Cushion." This receiver cushion will fit any telephone, and prevents shock to the ear as well as improving the hearing whilst listening. It is made of durable rubber, and should last a long time.

C. E. NICHOLAS, of the Nicholas Lightning Arrester Company, of Columbus, Ohio, has opened an office at Columbus to look after the cable work of telephone companies who do not keep a regular cable man. All companies who have cable work of any kind, such as repairs, locations of trouble, should communicate with Mr. C. E. Nicholas, who will be glad to give them all the aid he can.

THE BBOWNLEE LUMBER COMPANY has moved its offices from Meridian, Miss., to Chattanooga, Tenn., where it has erected a factory for the manufacture of cross-arms. This change was necessary to facilitate the handling of the Eastern business. The company will continue to operate its factory at Meridian, and also its warehouse at Cairo, Ill. Orders less than car-loads can be sent to Cairo as heretofore.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, of Buffalo, N. Y., has issued pamphlets describing switchboard protectors, distributing frames, lightning arresters, fuse blocks and combined cut-out switches. Particular attention is given to the description of self-soldering heat coils, and also to the distributing frames designed for this class of arrester. Copies of these pamphlets will be sent on request.

THE BAIRD MANUFACTURING COMPANY, of 24 Michigan street, Chicago, has just received a letter from the Hawaiian Islands, where its pay stations were recently installed. Mr. E. B. Carley, treasurer and superintendent of the Maui Telephone Company, of Paia, has this to say of the Baird pay stations: "I must say that they are a great financial surprise to me, as well as to the directors of our company; they work like a charm."

The W. G. Nagel Electric Co. is now putting on the market a very high quality of cable compound, under the head of "W. D. Insulating Cable Compound."

This cable compound combines all the essentials of a perfect insulating compound, chief among which is perfect insulation and an extremely high melting compound. It is packed in pails, each pail containing an average of eight pounds. To telephone companies desiring perfect insulation the company recommends its use.

THE CONNECTICUT TELEPHONE AND ELECTRIC COMPANY, of Meridan, Conn., has placed upon the market several new styles of toll line switchboards which are especially designed for heavily loaded lines. This company has realized the demand for a thoroughly reliable toll line board at a reasonable price and the sale has been very large on this material. A bulletin has been issued, which will be mailed on request, describing this apparatus. The company has also issued a new and enlarged catalogue, No. 8, which will be sent to all interested.

THE FARR TELEPHONE CONSTRUCTION COMPANY, of Chicago, Ill., reports a large increase in business. During the first week of July, orders were received from Mexico, Ontario, British Columbia, New York, Virginia, Kentucky, Nebraska, Michigan, Nova Scotia, Wisconsin, Minnesota, Tennessee, Washington, Illinois, South Dakota, Indiana, Colorado, Onio, Iowa, Missouri and Texas. The company has also gotten up a catalogue which describes its various types of switchboard, magneto instruments, desk sets, extension bells, wire tools and accessories. This catalogue will be mailed upon request.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE—The Ottumwa Telephone Company's plant at Ottumwa, Iowa, including Franchise and all its property. The Company owns the three-story brick building, built two years ago, in which is installed a Central Energy System, equipped for 1,540 full metallic lines, with selective ringing apparatus, all of the latest and the best. 1,250 telephones are installed, with 250 names on the waiting list. The Company also owns 80 miles of toll lines. This is one of the best telephone propositions in the State of Iowa. For full particulars, maps and photographs, address the Citizens' Savings & Trust Company, Cleveland, Ohio, or Henry S. Herr, Ottumwa, Iowa. 187

EXCEPTIONAL BUSINESS OPENING.—Want to meet a man or syndicate that can invest $20,000 cash at once and can furnish credit promptly to the amount of $80,000 more in a telephone proposition near Kansas City, Mo., with or without service. Address—with reference, no agents—Theodore Gary, Macon, Mo. 207

FOR SALE—Switchboards and Telephones, all capacities and makes, Terminals, Cross-connecting Racks, Cable, &c., at less than half cost of new. Guaranteed reliable and efficient. Chicago Telephone Apparatus Exchange, 17 S. Elizabeth St., Chicago, Ill. 184

WANTED

Advertisements under this head, 25 cents for 25 words or less for each insertion. Prepaid.

YOUR TOLL TICKETS!
HERE'S WHERE YOU GET THEM RIGHT!
12—GOOD FORMS TO CHOOSE FROM—12

FOR A DOLLAR BILL we will send you as a trial order, 1,500 of our No. 9 Tickets by return mail. All Tickets padded and transportation prepaid. 5M Large Size, $2.50. 5M Small Size, $2.25. Lots of 5M, 10M, 25M, or 50M. Write for our new catalogue, which gives samples and particulars. We also make Monthly Toll Bills, Trouble Tickets, and Artistic Office Stationery. Endorsed by AMERICAN TELEPHONE JOURNAL.
GILDART BROS., Albion, Mich. 168

SALESMAN WANTED—For general line of electrical supplies; experienced lamp salesman preferred. State previous experience; give references.. JULIUS ANDRAE & SONS CO., Milwaukee, Wis. 212

POSITION wanted with telephone company in Colorado or Arizona. I have had three years' experience and am an expert lineman and repair man. References furnished. Address Box 206, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 206

EXPERIENCED telephone man, capable to take charge of advertising or sales department, thorough knowledge of mail order methods and office systems, familiar with engraving and printing, wishes position with manufacturing or supply house in telephone or electric lines. Address Box 205, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 205

POSITION WANTED as manager or assistant in small exchange. Applicant is a young, energetic man of 23, with clean habits and affable manner; has a thorough, practical and theoretical knowledge of telephony and is not afraid of work. Best references. Moderate salary. Box 210, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 210

WANTED—A Fisher cable testing set, No. 1 or No. 2, manufactured by Leeds, of Philadelphia. Will pay cash. La Fayette Telephone Company, La Fayette, Ind. 208

SALESMAN WANTED—Man capable of selling instruments, switchboards, and supplies. Territory to be Middle West. State previous experience; give references. JULIUS ANDRAE & SONS CO., Milwaukee, Wis. 211

WANTED—Second-hand Telephone Apparatus, Central Energy and Magneto Switchboards, Telephones, Bridging Bells, Transmitters, Terminals, Cross-connecting and Distributing Racks, Ringing Generators. State details, price, condition and make. C. E. W., 17 S. Elizabeth St., Chicago, Ill. 188

POSITION WANTED—Telephone engineer, seven years' experience in manufacturing and operating companies, strictly temperate, honest and energetic, desires position as manager or wire chief. Good recommendations furnished. Address Box 213, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 213

PLAIN AND GALVANIZED

9-16 X 9, 5-8 X 9, 5-8 X 10 INCH
Other Sizes Made to Order

We make our own steel and do our own galvanizing, therefore lowest possible prices and quick shipment.

INLAND STEEL COMPANY, First National Bank Building CHICAGO

RIGHT IS MIGHT!

OUR POLES ARE RIGHT

We know as much about Telephone Poles as anyone can. We know how to give prompt attention to your business and to secure prompt deliveries by railroad.

A letter from you asking prices or other information will have the same prompt and courteous consideration that we would give an order for 100 carloads of poles.

WRITE TO-DAY

SAND POINT CEDAR CO., SAND POINT, IDAHO.

The Valentine-Clark Co.

Beg to announce to users of . . .

CEDAR POLES

that they are now better equipped than ever before for maintaining their prominent position among the leaders in the cedar industry. Making a specialty of Poles, they are identified with the leading producing sections, concentrate their material at advantageous shipping points and are in position for giving their customers the best of service.

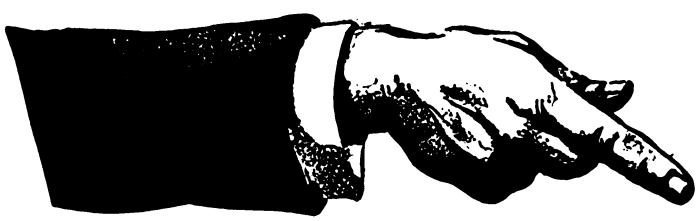
Two Things Every Telephone Man Needs

They are the American Telephone Journal (published weekly), a year's subscription for $1.00, and a copy of the new and revised edition of "The A. B. C. of the Telephone"; a practical book for telephone men. This new edition has been brought thoroughly up-to-date, and sells for $1.00. By a special arrangement we will send a copy of the "A. B. C." and give a year's subscription to the American Telephone Journal—both for $1.50.

$2.00 WORTH FOR $1.50



NOTE.—This offer is not good on Renewals.

The 1900 Dry Battery

THE most needed quality is reliability. No one wants a battery that will respond all right for a week or ten days then "suddenly go out of business." Another requirement is that it shall continue "strong" during its life. These two requirements besides many others are characteristics of

1900 BATTERIES

We guarantee them not to freeze, leak or break; we warrant them to work with a strong, steady current during their life (anywhere from six to eighteen months).

They are compact, always ready. They are better than wet batteries—no slop, no repairs, no breakage. Any one can replace a worn out one at a moment's notice. They can be carried anywhere—always ready for instant use.

American Telephone Practice

By KEMPSTER B. MILLER, M. E.

518 large pages, profusely illustrated with 380 diagrams and cuts of apparatus **$3.00**

A book for the telephone man. It is an encyclopedia of useful information concerning telephony.

It gives complete specifications, enabling you to intelligently order apparatus from manufacturers, and to properly supervise the installation of an exchange, large or small.

It describes in simple language the theory and practice of modern telephony, including circuits, mechanical construction and operation of telephones and switchboards.

A complete description is given of storage batteries, their care and maintenance; of aerial and underground line construction, and, in fact, all the important matters which telephone men need to know.

Originator of the Voltmeter Habit. **78 CORTLANDT ST., NEW YORK**

One Man

out of one hundred interviewed said he preferred a monthly paper.

"Why?" he was asked.

"Because" said he, "the monthly is larger."

He was not pressed to subscribe to The American Telephone Journal, because—well the reasons are entirely obvious.

THE AMERICAN TELEPHONE JOURNAL

There are other Things

besides technical and descriptive articles that must have space in a trade paper. These are important, but it must print the news of its particular industry.

Above all it must be steadfastly loyal to the interests it represents.

Dr. Henry S. Herr, one of the best known Independent operators in Iowa and president of the Iowa Telephone Association, in a recent letter to the Editor of this paper said :

> "If anyone ever doubted that you are working in the interest of the Independent Telephone business they would certainly be convinced of your loyalty by the activity displayed in exposing the Evansville (Ind.) telephone situation."

This article published on March 19, 1904, can be mentioned as one instance of the enterprise and loyalty of this paper. Every issue contains equally interesting and valuable articles.

SELLING Is Not the Most Important Thing With US

¶We believe prompt attention to a complaint is better business than a new sale. **ANDRAE Telephones and Switchboards** leave the factory *ready for hard work and lots of it.* But things *will* happen. For instance, an operator wrote: "My telephone will not work." It was 425 miles away and the order was small. But our expert went by the next train. And he found—the ground rods had not been put in deep enough. ∴ ∴ ¶It was needless and expensive trouble for us, but that operator is now our friend for life. He knows that **ANDRAE Telephones and Switchboards** have behind them **A Guarantee that Means Something.** ∴ ∴ ∴ ∴ ∴

CHURCH SERVICE BY TELEPHONE

PHILADELPHIA has recently contributed several ideas of novelty and value in the telephone field. In a late issue of our magazine we called attention to the news bureau installed by the *Evening Telegraph* of that city, by which the anxious householder can have queries answered almost immediately, upon any subject from how to run the kitchen range to the distance of the nearest star. Several weeks ago, Dr. Russell Conwell, the well-known pastor of the Baptist Temple, initiated a step in the telephone field which will probably lead to far-reaching and lasting developments.

The illness of a favorite daughter, in one of the Philadelphia hospitals, was the immediate cause of the new idea. Dr. Conwell's daughter had always been accustomed to linger lovingly over her father's sermons, and had many times helped him with his dictation. One may, therefore, imagine that she greatly missed the Sunday sermons of her parent. At this point a brilliant idea came to the pastor. Telephones had been used for the transmission of almost every conceivable idea. Why, then, should they not be used to transmit a sermon or a hymn to hearers at a distance? A temporary megaphone was accordingly rigged up in the pastor's temple and equipped with a telephone connection. Reclining in her bed, the next Sunday, in the hospital, his daughter was enabled to follow carefully the entire course of her father's preaching and even to join in many of her favorite hymns.

Preaching by Telephone to Hospital Patients.

The monotony of hospital life was so greatly relieved by this innovation that Dr. Conwell determined to carry out the idea on a larger scale for the benefit of others besides his family.

The Samaritan Hospital on North Broad street, of which Dr. Conwell is president, received the new idea with much pleasure and arrangements were quickly made to place telephones in all the wards of the hospital on the following Sunday. For the successful carrying out of this experiment a string of six of these megaphones was hung in front of the platform at Dr. Conwell's church. The Baptist Temple, it may be remarked, is one of the largest church edifices in Philadelphia, and is remarkably well adapted for the transmission of sound, so that the characteristics of the megaphone were admirably helped by the nature of the building itself.

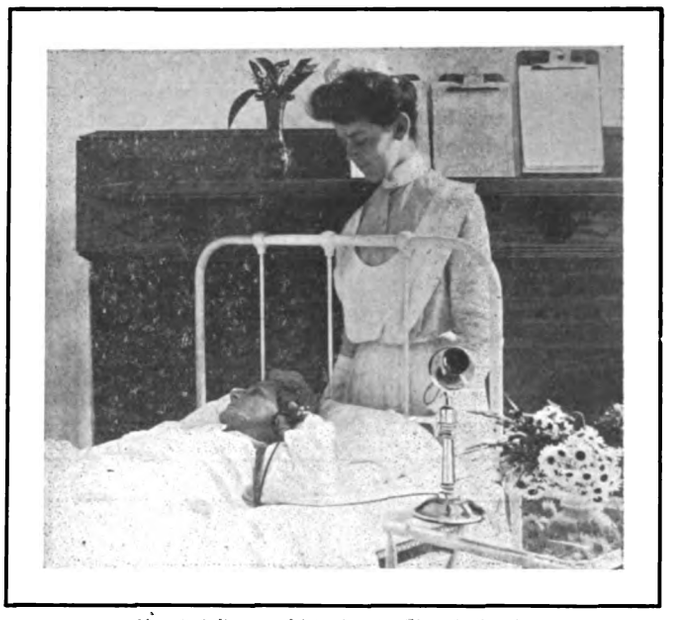
Clearly and sweetly the next Sunday the words of the old hymn, "How Firm a Foundation Ye Saints of the Lord" came to the patients in the Samaritan Hospital. By the receivers placed in the hospital ward, the singing of the splendid chorus and likewise the words of the sermon were heard distinctly by the patients. For those too weak to hold the receiver to the ear, head attachments were provided, so that they could follow attentively the entire sermon and hymn singing. The voice of the preacher came out strongly and clearly, each word being caught by the megaphones and carried to the delighted patients in the hospital. So realistically close was the singing to the accompaniment of the great organ in the Temple, that many patients joined in the chant. One after another, favorite hymns came over the telephone lines and were listened to devoutly by those in the wards. The illustrations, which show clearly the adaptation of the telephone to such a unique condition, are taken from the *Christian Herald* and the New York *Tribune.* Hereafter telephonic communication to the hospital will be a regular feature of Dr. Conwell's services.

The matter has also been put before the trustees of other hospitals, and it is expected that before long most of the large sanitariums in Philadelphia will be in connection every Sunday with the sermons of Dr. Conwell and the hymn singing of his congregation. This startling innovation has favorably commended itself to a number of the Philadelphia clergymen, although many of them are loth to express themselves on the subject, preferring to await its further development before determining finally whether or not the innovation will be

Digitized by Google

generally feasible. A similar arrangement, however, is under consideration by the Rev. Neil, pastor of the Second Baptist Church, on North Seventh street, Philadelphia, to connect with the Old Ladies' Home, which is maintained by this church.

Strange to say, it appears that in far off Texas, an idea very similar to Dr. Conwell's was put into practice at almost the same time that the Philadelphia pastor connected his church with the Samaritan Hospital. By the courtesy of the Citizens' Telephone Company of Paris, in that State, a service was established into the homes of the members of the First Cumberland Presbyterian Church from the church building. Members of the congregation, who are patrons of the telephone company, can now listen to the services and hear the sermons at home without having to go to church. Manager Dunaway has recently installed this service, and after a thorough test it has been found to work extremely satisfactorily. It marks, in fact, a still further step in the direction taken by the Philadelphia pastor.



Hospital Patient Listening to Church Service.

One might almost fancy that if the idea should be extended much farther, the entire necessity for a church building would be obviated and that the congregation could follow their rector, and even join in chorus singing in the privacy of their homes while the pastor sat talking into a large megaphone, in the retirement of his study. If such an idea were fully extended there would be the additional benefit that one could, without any trouble, select their favorite preacher, or change from one sermon to another.

Mr. Dunaway claims that when living in Pittsburg, some years ago, the idea of providing a sermon for the benefit of stay-at-homes first occurred to him. He further states that at that time he once connected a hospital with one of the clergymen of the city in a manner practically similar to that by which Dr. Conwell has recently gained so much attention.

The new departure of Dr. Conwell's calls to mind the extension which has been made in the last year or two of telephone usage in the more out-of-the-way places and conditions. For example, many of the best equipped trains have now telephonic connection between the conductor and the engineer. Also the traveling man, in many instances, finds himself able to talk to business houses at stations where a temporary stop is made, without dismounting from the train and running the risk of missing his connections. Passengers may talk to friends, or customers to clients, without alighting from the car. This idea was first successfully tried as an experiment on a Western road and was fully carried out during a recent trip of some prominent officials of the Pennsylvania Railroad. It now promises to come into general use on many of the railroads of the country. Many commercial travelers have a few connections in the smaller towns. To call on each of them would involve delays comprising several days, with a possibility of no business being done. Now, on the railroads spoken of, all that the salesman has to do is to call up on the telephone his more obscure and doubtful customers and briefly put his proposition before them. He then knows whether they wish to see him or not.

Again, in this country of long journeys and frequent absences, it often happens that a business man remembers, at the last moment, that matters of importance have been carelessly overlooked which must be attended to before his return. Under conditions as they have existed, this meant a long interval of anxiety before the trains would stop where the remedy could be effected by means of the telegraph. Now, on those railroads which have installed the new apparatus on their trains, the busy traveler can communicate directly with his office from the car, at the first stopping place.

In another direction, the telephone has proved to be of great benefit to the trainmen themselves. The frequent nuisances of friends bidding farewells, and tearing themselves away at the last moment, to the great danger of their limbs and to the anxiety of the trainmen will be shortly entirely obviated. Instead of beseeching appeals to acquaintances and relatives to make haste, the trainmen will now merely sever the wire connection and the traveler will be obliged to stop talking.

CONSTRUCTION AND OPERATION OF EXCHANGE CIRCUITS

By E. Francis Parker.

ARTICLE I.

ONE of the most important things to be learned by a man who is clearing switchboard trouble is the general outline of the various circuits, the relation of the different pieces of apparatus to one another and methods of wiring by means of cables. In the following article it is the purpose of the writer to describe some of the circuits he has worked on, illustrating the connections from the entrance of the cable to the exchange building through the various appliances up to and including the switchboard. Referring to Fig. 1, it will be seen that the circuits enter the building in underground cables, which go to the inside springs of the protective devices mounted on the vertical side of the main distributing frame (*M D f*). From there they pass through the heat coils to the outside springs, which connect by means of cross connecting or jumper wires to the horizontal side of the main distributing frame. It is important to note here that each color of the jumper wire is always used to make the same connection—that is, one color is used to connect the line side of the protective device to the line connection of the lug on the horizontal side, and the other color performs the same function for the test side. This rule never varies, otherwise the confusion that would arise from indiscriminate connections of the red and black components of the connecting wire would cause a tremendous amount of delay in tracing circuits, which is impractical.

The two lugs which are the terminals on the horizontal side of the main distributing frame (*M D F*). From there they pass tion. These contacts are used when a change is made from one

Digitized by Google

line to another, so that the telephone circuit may not be broken to the switchboard while the transfer is being made. The method employed is called making a half-tap, and is as follows: Supposing it is desired to change the underground conductors of a circuit, which we will call No. 21 pair to No. 36 pair. The old jumper wire is disconnected from its present lugs and connected to the two other lugs. Then the new jumper wire is run from the underground pair 36 to the lugs that were formerly occupied by the old jumper wire, and when the connection is completed the old wire is cut off and pulled out of the frame. It is very important that all old jumper wires should be taken out, otherwise when the frame man is called upon to assign a new pair, and he finds cross connecting lines connected to it, a large amount of delay will be caused in tracing.

From the lower side of the terminals the wires run off in twenty-one pair cables to the lower lugs of the terminals on the horizontal side of the intermediate frame. Besides the two terminals used for these connections, there is an additional one, the object of which will be apparent later. A triple conductor cable is tapped on to these three terminals and goes to the multiple jacks. To the upper lugs is connected a triple conductor jumper, which connects to the upper lugs of the terminals on the vertical side. It will be noticed, tracing the various connections, that the test side of the circuit, which is the red wire of the twisted cross-connecting pair, at the main distributing frame connects with the white component of a pair in the twenty-one-pair cable, which in turn connects with the white conductor of the triple jumper wire of the intermediate frame, and that the black wire of the main frame jumper connects with the colored wire of the pair in the cable to the intermediate frame. This connects with the black conductor of the jumper which goes to the vertical side.

Attention is called to the position of the lugs upon the intermediate frame. The white wires connect with the inside lugs, the black wires with the next lugs, and the red wires with the front terminals on the horizontal side, and the second terminals from the front on the vertical side. The additional terminal on the vertical side is known as the lamp contact, and is used to connect the lamp associated with the line in the answering position to the line relay.

The third connection, as it is generally termed, which is made by means of the red wire, connects the sleeves of the multiple and answering jacks, through the red wire of the cable to the relay rack, with the winding of the cut-off relay.

It will be seen that the vertical terminals on the intermediate side have connections for two separate cables. One of these runs to the answering jack panels and the other to the relay rack. In both instances they are quadrupled conductor cables, of which the white and the colored wires form the talking circuit, the red wire the circuit for the third connection, and the fourth conductor goes to the contact of the line relay, the armature being grounded on the frame; a tap is taken off the lamp wire to a 300-ohm resistance coil connecting with a strap that connects with a lead to the pilot lamp, the other side of which connects with a battery strap. The red wire connects with one end of the winding of the cut-off relay, the other end of which is grounded.

The operation of the circuit is as follows: When a subscriber takes his receiver off the hook a shunt is thrown across his line, which completes a circuit from the grounded spring of the cut-off relay out over the line through his instrument back through the other spring of the cut-off relay, which connects with the winding of the line relay, and thence to battery. This causes the line relay to be energized, closing its armature with the line lamp contact, and thus forming a circuit from the battery side of the line lamp through the relay contact armature to ground, and also a shunt path is formed through the 300-ohm resistance coil and the pilot lamp to battery, lighting both line and pilot lamps.

a combination of red and color. It might be well to state here what is meant by color. It is necessary to distinguish by some means the separate wires of a cable, and for this reason a color scheme has been devised which in general use is as follows:

1—Blue.	11—Orange and white.
2—Orange.	12—Orange and green.
3—Green.	13—Orange and brown.
4—Brown.	14—Orange and slate.
5—Slate.	15—Green and white.
6—Blue and white.	16—Green and brown.
7—Blue and orange.	17—Green and slate.
8—Blue and green.	18—Brown and white.
9—Blue and brown.	19—Brown and slate.
10—Blue and slate.	20—Slate and white.
	21—Red and white.

The 21st wire is a spare and is only used in case one of the others is bad.

The lamp wire circuit is made up of the same color that is used in the talking circuit, and a red thread is added. In this way, supposing jack 18 has brown and white for its line color, then the lamp wire would be brown, red and white. At the relay rack the colored wire connects with the spring of the cut-off relay, which is normally grounded on the frame. The white wire takes the other spring, which connects with the winding of the line relay, which in turn connects with a battery strap. The lamp wire

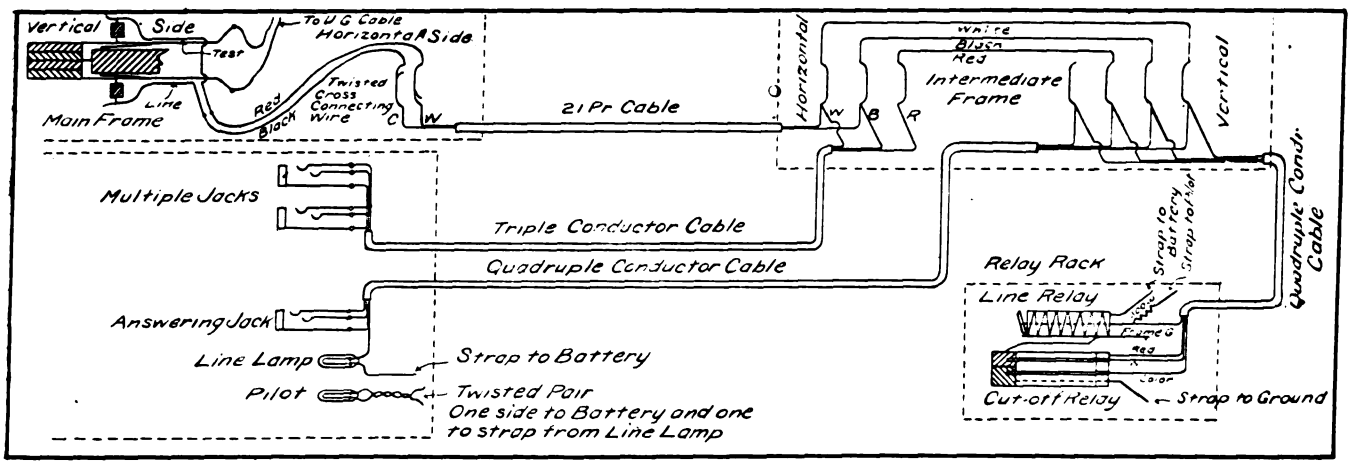


Fig. 1. Showing Arrangement of Cables and Cross Connecting Frames.

INDEPENDENT COMPANY FOR MILWAUKEE.

THE Independent Consolidated Telephone Company, which has made considerable progress in Wisconsin in the last few years, is preparing to enter Milwaukee. The company is selling stock with a view to extending its system from Jefferson to Milwaukee. The line will be built to the city limits and then the first steps will be taken to get a franchise.

Digitized by Google

COST AND COMPENSATION.

By C. H. Judson.

THE probem of rates has been an extremely vexing one to Independent telephone men, and the inability of the inexperienced promoter to fix a rate which shall be low enough to be attractive and at the same time profitable, has in the past resulted in much disappointment and grief for the ambitious manager, and in many instances in unjust criticism of his economic system. With the Bell it was "all the traffic would stand," but with the competing manager the case is very different.

There is a low-water mark in the expense account below which are the shallows, reefs and sand bars of poor service, destructive decay and bad collections, and no manager, be he ever so brilliant, can steer his craft to the harbor of prosperity unless he has below his keel sufficient depth to float his craft with its full investment cargo. A knowledge of this mark is absolutely necessary before the boat is loaded or disaster is bound to result. Many country operators have been led into the too-low-rate error by telephone and supply salesmen who, knowing nothing of the business, have unhesitatingly advised ridiculously low rates in order to encourage the prospective purchaser to buy his goods. I believe, however, that this type of salesman is almost extinct, and it is now the policy of all reputable manufacturing houses to render as much accurate information as possible along these lines.

	A	B	C	D	E	F	G	H

G and H companies are the only ones paying rent. The other six own their own buildings.

Cost of Operation.—Table Showing Averages per Telephone per Annum in Eight Exchanges.

Experience has shown that the average community suffering from Bell abuses has not demanded extravagant reductions of rates as the sole form of relief but that it is loyal to the local company that gives good service even where rates have been but slightly reduced. Witness the hundreds of instances where the Bell rates have been cut far below the local company's rates in a frantic effort to retain the business. If there can be no reduction of rates without making them unprofitable there should be some other very good reason for the establishment of the competing system.

Now to get at the meat in the cocoanut. How is the inexperienced operator going to know what is a profitable rate? The factors of cost are:

1. Traffic.—Operators' salaries usually compose this item. In large exchanges a division of heat, light, water, rent and power is frequently made and a portion charged to traffic, but in smaller plants such a separation is hardly required.

2. Maintenance.—The cost of keeping the plant in good repair. This head will not include replacement of worn-out lines or apparatus (depreciation taking care of that), but the repair of all ordinary wear and tear, the cost of rearranging line circuits, if necessary to meet varying conditions, even to the resetting of poles and relocating of subways if such becomes necessary. Also the cost of moving instruments where no charge is made for this service. Some companies also charge all instrument wiring on new work to this account.

3. General expense, which may be again divided if desired and which includes all office expense, insurance, rent, light, heat, water, power, advertising, directories, janitor service, traveling and whatever is not specifically included under other heads. Of course the distribution of items is largely arbitrary.

4. Taxes. 5. Depreciation.

6. Interest on bonds and dividends which may be guaranteed.

The plant must earn enough to pay the preceding charges and leave a surplus sufficiently great to apply as dividends on the stock. It is a wise manager who in addition to the above will also desire to lay aside a fund to replace property destroyed by extraordinary causes, such as tornadoes, floods, fires, etc. The annual charges can be at least approximated, but the emergency requirements are wholly beyond calculation. The acts of Providence being without the pale of human calculation, it is wise to make a liberal provision for the emergency fund, knowing that if the extraordinary damage does not occur the undivided surplus is always available.

The item of depreciation is one which has been greatly exploited by Bell minions who wish to discourage investment in Independent enterprises. They say that their companies have always provided a large margin for depreciation, but unfortunately for the truth this item seldom appears on the records of the Bell companies when they are opened for inspection. The fact remains that the item is an important one and cannot be overlooked. It has been the subject of a resolution in at least one association meeting, which fixed a rate of depreciation to be charged off by the members on their plants.

While the moral effect of such a resolution is good the utter impossibility of fixing a flat rate of depreciation to apply to all plants within a given territory, regardless of the quality of construction and equipment, is readily apparent. I do not wish to fix a rate, but I have found that on high-grade work the opinions of a large number of experienced operators, both Independent and Bell, will average about as follows:

Clay conduit	2%
Underground cable	5%
Aerial cable	7%
Copper wire	2%
Iron wire	10%
Poles and cross arms	8%
Telephones and switchboards	10%

So that by separating the various items of construction it will be a comparatively easy matter to arrive at a figure for the item of depreciation, keeping constantly in mind that wood decays and iron rusts at varying rates under different conditions.

The accompanying table has been compiled from the actual accounts of eight telephone companies now in business, and is an excellent exhibit of the averages of the items mentioned, the different exchanges being designated by the letters from A to H. In each of the cases mentioned the best of service is being given with the best of equipment, and lines and apparatus are being properly cared for. They are in widely separated sections of the country, so that there may be slight differences in wages and

Digitized by Google

cost of materials. I have been unable to secure figures at all reliable from any exchange operating less than 400 telephones, but from such data as I have I believe that a reduction of from ten to fifteen per cent. below the figures given for H might be made. The difficulty in getting accurate figures on very small exchanges is due to lack of bookkeeping, most of the accounts of such being mixed with the accounts of other business enterprises belonging to the owners.

It will be noted that some of the exchanges are using party lines and some are not, also that there is considerable variation in some of the figures. This may be due to different methods of separating accounts or to different methods of management. I shall have occasion to use this table with additions covering depreciation, income and interest charges in a later paper in order to show the earning power of a modern exchange.

In each of the exchanges used as illustrations every item of labor and material is a cash charge, and no officer or owner gives any time without compensation, as is the case in very many Independent companies. The exhibit is not intended to be an illustration of the average exchange, but a selection was made of the eight which the writer believes to be the best conducted among a large number which he has visited. It is thought that the figures are sufficiently high to be safely used as a basis for estimating.

Having made a liberal estimate of the cost of the plant, always allowing in the wire plant thirty-five per cent. margin over the actual number of lines in use, ascertain the cost per telephone, then calculate the depreciation and add to this item the cost of operation. In example E the average cost of the plant per telephone is $98, and being exceptionally well equipped with cable seven and one-half per cent. is considered a fair allowance for depreciation. This amounts to $7.35, which added to the item of operation makes a total of $20.20. Allowing five per cent. for extraordinary damage and eight per cent. for interest on the investment, $12.74 must be added, making a total of $32.94, which must be received as the average earnings of each line in the exchange. But there are other sources of income, extensions, toll commissions, etc. Estimating $3 per line as a fair allowance, although local conditions will modify these figures, and adding two per cent. of the total receipts for lost accounts, the final figure, $30.54, is arrived at.

Supposing that sixty per cent. of the telephones are residence lines and forty per cent. business, it is quickly found that the business rate should be approximately $40 and the residence rate slightly over $24 per annum.

It may be found that these rates are higher than can be secured. Should this be so then recourse must be had to the party line, reducing the cost of the plant greatly and reducing the income but slightly. This panacea for the ills of cost and compensation was long ago discovered by the Bell company, but the remedy was so easy to give that it was administered in too large doses and the patient sickened. The prescription, however, is a good one, and is the proper solution of the problem in many localities. But that is another story.

As the exchanges mentioned herein are all manually operated, the figures, obviously, will not apply to automatic work. Up to the present time complete and reliable data on the cost of operating large automatic exchanges over periods long enough to make it of value have not been available. It is expected, however, that these figures will be at hand for presentation in an early paper, for a discussion of the problem of cost and compensation would be but partially complete without them.

THE ROCKY MOUNTAIN BELL'S LATEST EFFUSION

SOME time ago the Rocky Mountain Bell Telephone Company issued a remarkable circular in which it claimed prior right of telephone numbers under the copyright law. This absurd claim was ridiculed from one end of the country to the other, yet the company does not seem to have profited by the experience, for it has issued another remarkable document in the shape of a reply postal card. This reply postal card on the sending half contains the statement that the Rocky Mountain Bell Telephone Company now has 6,000 subscribers in Salt Lake City. By actual count the number of subscribers is 4,760, of which 800 are individual circuits, the balance being party lines. Then the writing on the card states that the best telephone service is obtained by the use of standard instruments, and like all standard instruments, which are delicate, they are liable to get out of order.

Some of the standard instruments it refers to are old Blake sets working on grounded lines. The company further states: "We assume that the instruments are in good working order, unless notice to the contrary is given to the company." We do not exactly see what the duties of wire chiefs and inspectors can be when these conditions are assumed, and finally this remarkable effusion concludes with: "If you have any complaint to make at any time of service or attention, please mail attached card and also give notice, either by telephone or personally." The reply half of the postal card has a space for the telephone number, street address, nature of trouble, the name of the party, and date.

After the Bell telephone companies have been publishing the fact that "the mail is quick, the telegraph quicker, and the telephone instantaneous," it seems rather ridiculous that they should resort to the mail for information respecting a telephone. The real truth of the whole situation is this: The Utah Home Telephone Company is rapidly coming to the front, and whereas formerly any old sort of service would do, now the Bell Company sees the folly of its ways, and like a drowning man catching at a straw, is making desperate efforts to square itself with the public.

Throughout the whole State of Utah, the Rocky Mountain Bell Telephone Company is the butt of all the latest comic jokes. At Logan and Provo, the public is up in arms against it. So badly scared is the Bell Company in Salt Lake City that it has secured all the billboards available and covered them with announcements as to its greatness. Blowing one's horn may be a good practice when there is something worth while to blow about, but it appears in this case that it would have been better had the unsophisticated Bell advertising manager concealed his light under a bushel. An old, worn-out phrase of Lincoln's, "You can fool some of the people all the time, and all the people some of the time, but you can't fool all the people all the time," would have been a first-rate maxim for the Bell Company to have adhered to.

CANASTOTA, N. Y., REVOLTS AGAINST BELL.

THE circular letter recently received by Canastota subscribers from the Central New York Telephone & Telegraph Company, to the effect that contracts for telephones at the $24 and $15 rates must be signed and returned before August 1st or telephones will be taken out on August 15th, has started the Independent exchange ball rolling again.

John W. Souter, who has conducted the fight against the advanced rates on behalf of the Canastota subscribers, stated that he would especially request all subscribers not to sign the contracts until the Independent question has been thoroughly threshed out.

The Farmers' Telephone Company appears to be the concern most liable to install a new exchange here. A meeting of the directors has been called at which the capital stock will be increased from $1,000 to at least $10,000, this move to be taken with reference to the Canastota exchange project. Two other concerns have also recently made propositions regarding exchanges.

THE USE OF THE PEG COUNT IN CENTRAL OFFICE OPERATION.

By A. Dallam O'Brien.

ARTICLE III.

UPON the proper distribution of the operating force in the central office depends the efficiency and class of service given to the subscribers, and the previous knowledge of the time or times during which the central office is called upon to handle the bulk of its traffic enables the manager to distribute the operating force to the best advantage. From the hourly data obtained from the peg count, the load curve is plotted, and from this curve the variations in the amount of traffic handled throughout the twenty-four hours can be seen at a glance and the operators' working hours arranged so as to have the maximum force on hand at the time of maximum demand.

The curve shown in Fig. 5 is a typical load curve for a central office handling 10,000 originating calls per day. The characteristics of this curve are very marked, and it does not require a close inspection to show at just what times it is necessary to keep a large operating force on hand, and, also, when such a force would be superfluous. Starting at 12 o'clock midnight and following the curve until 6 A. M. the load is seen to be practically nothing, and the number of night operators between these hours will be small. At 6 o'clock the curve begins to rise rapidly until it reaches its maximum between 11 and 12 A. M., at which time

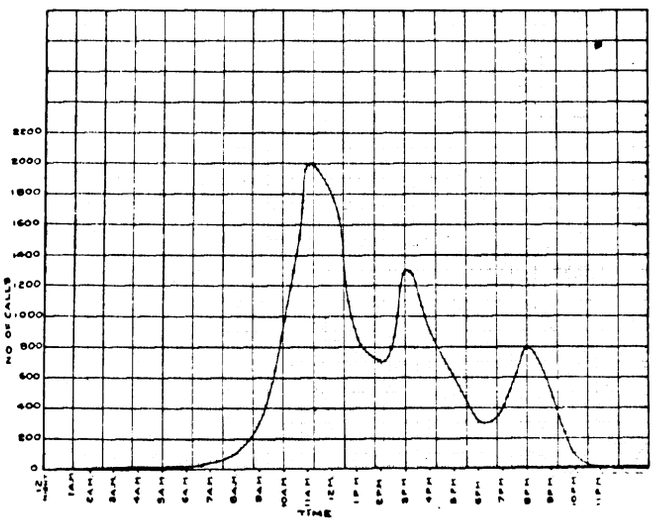

Fig. 5.

the office is handling its greatest load. From 12 until 2 the curve drops somewhat, this period representing the time during which the subscribers are at lunch. From 2 o'clock until about 3.30 the load rises again and reaches a high point, which, however, is not, as a usual thing, as high as the peak reached in the morning. After 4 o'clock the load drops off rather sharply until nearly 7, when it begins to pick up and reaches another high point around 8 o'clock, and from this point drops off rapidly, as shown.

In central offices which are located in a district which is entirely confined to business interests, it is probable that there will not be such a rapid rise of the curve between the hours of 6 and 8 P. M., and that the afternoon peak will be higher, but in residential sections and in districts containing places of amusement this evening rise will be decidedly perceptible and provision must be made to care for it. On the basis of the curve shown, it may be well to consider the distribution of the operating force employed by one large company with which the writer has been connected. The operators' working hours are divided into a number of different turns, as follows: First, operators whose time of duty is from 7 A. M. until 5 P. M.; second, operators whose time is from 8 A. M. to 6 P. M.; third, at 9 A. M. the relief operators come on duty and work until 1 P. M., and again come on duty at 6 P. M. and work until 10 P. M. At 7 P. M. the night operators report and are on duty until 7 A. M., being divided into two reliefs, as will presently be explained. From this distribution of force it will be seen that the peak of the load which occurs in the morning is taken care of by the maximum number of operators, and that the relief operators again assist the night operators in handling the smaller peak which occurs in the evening.

Except in unusual cases the regular day operators are entirely able to take care of the afternoon load. As the amount of traffic to be handled between the hours of midnight and six in the morning is so small, and as the night operators are assigned to a term of duty lasting twelve hours, it is customary to divide the night force into two shifts and thus allow the operators some time for rest. In the case cited, half of the night force are relieved from duty from 11 to 11.30 P. M., the other half being relieved from 11.30 until midnight; during this time the operators have their lunch. At midnight the operators whose lunch time extended from 11 until 11.30 are allowed to retire to their quarters and sleep until 3 A. M., at which time they again come on duty, take the place of the other relief, who, in turn, are allowed to sleep until 6 A. M. At 6 A. M. the entire night force is on duty and remains so until relieved by the first detachment of day operators, who report at 7 A. M. As will be noted in this distribution of the operating force, the night operators are practically on duty for twelve hours, as it is questionable whether three hours relief which is allowed them fulfills its purpose. It is far better practice to cover the switchboard with relief operators up to 10 P. M., and thus allow the night force to serve from 10 P. M. to 7 A. M. at some time allowing an hour or so for rest. The operator will be able to do more efficient work under these circumstances and will not be subject to so great a strain upon her vitality.

The operation of a central office containing a multiple switchboard during periods of light loads, when only two or three operators are employed in handling from twenty to thirty positions, is readily accomplished by stationing two operators at the switchboard to handle originating calls and one operator at the incoming circuit positions to handle all incoming trunk calls, the incoming circuits all being connected on one position by means of switching keys, and in addition having one operator on the floor to act as a patrol. The night bell, which forms an adjunct to the switchboard, is thrown into service as early in the evening as the traffic warrants, and it is the duty of the patrol, when the night bell rings, to locate the calling line and call out its number. The line is then taken up by one of the operators in its multiple jack and the call completed in the usual way. This method of operation is a very simple and efficient one where central energy switchboards, with lamp signals, are employed, and the patrol is easily able to locate the calling line. In the case of the magneto boards, with the drop signals, the operation is necessarily not as rapid, as it may take some time to locate a fallen drop.

In cases where it is desired to determine the relative loads upon the different operators' positions, in order to effect a redistribution of lines, should the results of the investigation show it necessary, individual peg counts may be taken for each position without involving much additional labor, and the position load curves plotted and compared, thus giving an accurate method of determining the load on each operator, and this information, with the aid of the intermediate distributing frame, enables the

Digitized by Google

central office manager to properly divide the load among the various operators.

From a comparison of peg counts extending over a considerable number of months, curves can be plotted showing the rate of growth of the different classes of lines in each exchange; the changes that occur in the calling rate of each particular class and the rate of growth of the number of connected stations. With this data at hand, it becomes a comparatively simple task for the engineer to estimate upon the required equipment for any given central office necessary to meet the needs of that office during a given period of time, and, consequently, where such records are accurately kept the exchange manager is enabled to keep his equipment somewhat ahead of the growth of the office and is not continually cramped for facilities.

It is customary when adding to the equipment of a central office to provide for a period of growth covering about three years from the date of the addition. This length of time is used for a number of reasons. In the first place, it would naturally be poor policy to install equipment which would bring in no return on the investment for a considerable length of time, and, in the second place, when installing equipment to-day it is quite a question as to how long it will be before such equipment is out of date. It is necessary, however, in order to assure satisfactory operating conditions, that the time spent in having an equipment force working in a central office be reduced to a minimum, as there is always more or less trouble produced at such times and the efficiency of the service more or less impaired. Aside from this consideration there is the additional fact that the addition of equipment in small lots is considerably more expensive than where it is added in bulk, and this is naturally a point that is carefully considered. From the foregoing description of the peg count, and the results which may be derived from its intelligent application, it may be readily comprehended that the time and labor necessitated in its preparation are entirely justifiable and that the knowledge gained thereby will much more than pay for its cost.

While the methods outlined herein are as a usual thing applied to the regular monthly count, yet there are numerous circumstances that arise in central office operation which fully warrant special applications, particularly as applied in individual positions, and it will be found that an intelligent use of such special tests will have a great effect upon the efficiency of the service given to subscribers. It is to the public that a telephone company looks for its revenue, and where there are competing companies the one that furnishes the best service gets the subscribers, and it is invariably the case that the manager who has the most intimate knowledge of the traffic conditions existing in his exchange is enabled to render to the public a class of service that satisfies existing subscribers and brings in new ones.

OPERATORS' TROUBLES IN LONDON.

THAT the telephone girls in London do not differ from any other class of people who have to earn their living, is evidenced by a report received of a strike which they conducted for shorter hours at the new Holborn exchange. It appears that the girls had signed contracts for forty-five hours a week, but were called upon later to sign their names to a rule book which would compel them to work ten hours a day. Under the old agreement the girls worked from eight to eight and one-half hours a day, with a five-hour period of duty on Saturday. Under the new agreement they were supposed to work two extra hours without pay. Many of the senior girls would not sign, and seventy of them refused to return to duty till the obnoxious clause had been cut out of the rule book.

In an interview, one of the operators said: "For the extra two hours we are offered no additional pay. Our wages are small, only 10s. ($2.50) a week, and the matter of increase is only periodical—1s., or twenty-five cents, after the first six months, 1s. after the second, and 1s. for each following year. Now these raises in salary are always affected by the black book. This black book is a register in which all the heinous crimes committed by the girls and breaches of discipline are counted against a raise. For instance, if one girl should surreptitiously answer 'yes' to a subscriber instead of a number, there is a black mark against her record. One day a girl broke a pearl necklace. For stopping to collect the scattered pearls, the enormity of the crime was referred to in the black book as 'playing with beads.'"

It appears that the girls have other woes besides a matter of salary and a black book. One of them complained that the chairs were too hard, and another one that the weight of the new receivers makes them instruments of torture, and still a third claimed that the little electric lights instead of targets were causing them to develop a squint. When interviewed, the manager of the Holborn exchange had nothing to say, except that hitherto the girls had worked for a shorter period than they had signed for, and now that the full time was required they were discontented.

To keep the switchboard in operation, relief operators were drawn from the other London exchanges. Twelv girls, however,, on their way from the Gerrard exchange, were met by the strikers, and, of course, wanted to hear all about it. When the tale of woe was unfolded, the Gerrard girls one and all turned to the right about and marched back to Gerrard in a body, saying they would not play the part of scabs. Sad to relate, however, for their honor, they were promptly dismissed with a week's pay.

The telephone girls employed by the post office are also complaining. Once in three weeks they have to do Sunday duty. Said one of them: "For this extra service we only receive the munificent sum of 3s. 9d. ($0.93), then I have to give up my whole day, pay my railroad fare, which is $0.16, and buy my dinner. We are trying to get a minimum rate of pay of 5s. for Sundays. We are the only body of women in the civil service who have to work on Sunday."

When the wages paid English operators, or for that matter European operators in general, are compared with the scale of wages paid for the same duty in this country, it would appear that they have a just cause for complaint. Girls that are just starting in the business in this country earn $2.00 a week, whilst competent operators earn from $6.00 to $10.00 per week, the working hours being about the same.

As a result of this and other grievances, the operators have decided to form an alliance to be known as the National Association of Telephone Operators.

REPORT OF GLASGOW CORPORATION SYSTEM.

THE third annual report of the Telephone Committee of Glasgow shows that the total revenue for the year ending May 31st last amounted to £49,639, while the working expenses totalled £29,119. The gross surplus, therefore, was £20,520. After deducting interest on loans and sinking fund charges a net profit of £3,651 remained. There are now 11,405 telephones in service, 9,065 partially finished lines, and switchboard accommodations for 12,062 lines. The length of the underground cable is nearly 205 miles. The rate at the end of the year was about 18,000,000 calls per annum. The number of public pay stations has increased to 235.

Mr. A. R. Bennett, consulting engineer to the undertaking, noted that the gross cost per line at Glasgow is £28 2s. 6d., including a portion of the preliminary expenses, exclusive of which the gross cost per line would be £20 6s. 6d. This is about 25s. per line more than the original estimate, due to the adoption of underground distribution in the city, where overhead work had been allowed for. With a net surplus of £3,651 this year and £2,092 last year, the assertion that the rates of £5 5s. for unlimited service and £3 10s. per annum and 1d. per call are too low, appears to be totally wrong.

UNDERGROUND VS. AERIAL CONSTRUCTION.

WHEN shall conduit be used is a difficult and ever recurring question to the telephone exchange manager. In a general way, he understands that circuits which are underground are exempt from many of the disturbing influences which prey upon the overhead line. No sleet storms can touch an underground cable, nor can the fiercest hurricane which ever blew cause a moment's uneasiness to the company whose lines are in a conduit. So much was certain, but conduits are expensive things, and what might happen in case of an extensive fire no one knew. The crash of a falling wall might, it was urged, crush the conduit walls or the heat of incandescent brick might reach the cable and melt the easily fusible lead sheath and in a few moments work incalculable injury. There was no experience to show how an expensive conduit system would survive a severe conflagration, and many felt that the fire risk was too great a hazard to be lightly incurred. The way in which the Baltimore subways passed through the fiery ordeal, which visited that city last winter, has destroyed the only objection and removed the only fear which in the past has involved the conduit system.

During the progress of the fire thousands of tons of incandescent brick to which as much more weight in "I" beams and structural iron was added, were precipitated into the streets, in many cases covering the surface of the pavements twenty or thirty feet in depth. In an endeavor to check the progress of the flames many buildings were blown up with dynamite and the shock of these explosions added to the impact of the falling building material. Finally the fire department so flooded the streets that in many cases the conduits were completely submerged. How had the conduit survived was anxiously queried by the owners of hundreds of miles of cable.

As soon as practicable after the fire an expert commission was appointed to investigate the condition of the subways and report as to their condition and ability to survive an ordeal of unprecedented severity. The report of this commission has just been rendered. Within the burnt district there were about 13,825 feet of trunk line conduit, containing 49 manholes located at street intersections. There were also about 26,325 feet of distributing conduit containing 24,365 feet of house service, including 123 junction boxes, 230 service boxes and 876 individual house connections. Careful examination of the trunk line conduits failed to reveal the slightest injury to any structural part of the system. In two instances the cast iron plates covering the manholes were broken by the falling walls, and, where to reduce the noise of traffic, the covers had been filled with asphalt, this was melted and had to be replaced. The trunk line conduits were placed within two feet of the street level. The manhole roofs were brought to within 22 inches of the street surface and were composed of 10-inch "I" beams; none of the manhole roofs were injured in the slightest.

The distributing conduits were more exposed because such lines are laid close to the sidewalks in shallow trenches, broken every 60 or 70 feet by service boxes. On the whole, it appears that the distributing systems came through the fire unscathed; the only damage that has so far been noted is that resulting from gas explosions.

DESIRABILITY FOR THE USE OF CONDUIT.

The conduits contained the cables of the United Railways and Electric Company, the United Electric Light and Power Company, the Maryland Telephone and Telegraph Company, the Chesapeake and Potomac Telephone Company, Postal and Western Union Telegraph Companies, and the power leads of the Baltimore and Ohio Railroad Company. In almost all cases the service connections at the ends of the cables were completely destroyed, irrespective of whether such connections entered through the house walls or whether they were on poles leading to aerial distributing systems. But with the exception of the injury to the distributing points, none of the cables of either the electric light or power, or of the telephone and telegraph service was injured.

Mr. Charles E. Phelps, chief engineer of the electrical commission of Baltimore, under whose direction this report has been compiled, draws the following conclusions:

"First. The only safe and sure investment for a transmission or a distributing system is one made beneath the surface of the street.

"Second. Any reasonably well-constructed system of underground conduits is proof against damage and interruption to service, even when subjected to such unusual stresses as occurred during the fire of February 7th and 8th last.

"Third. With underground house connections, the only damage sustained is at the house, and as the house is destroyed, the revenue-earning capacity of the connection is gone, but it is perfectly feasible to so protect the house ends of connections that a new splice may be made in the cellar instead of going back to the cable in the distributing line. All the cables entering cellars were burned off so close to the mouth of the duct that there is no room for a new splice, and service connections must be renewed from the service box; this does not represent a large loss.

"Fourth. With reference to ventilating the system as a precaution against gas explosions, the only recommendation to be made is one looking to a continuance of effort to provide an efficient method of sealing house connections at both house and service box ends to prevent fire in buildings from communicating with an explosive mixture in service boxes.

"Fifth. The provision made for ventilating the trunk manholes is adequate even under such conditions as existed during the fire, which, together with the weekly inspections, should be continued, with such improvements as may, from time to time, be found to have merit.

"Sixth. The house-to-house system should be extended, but without, at this time, any specific recommendations.

"Seventh. Although every pole and pole connection within the burned district was destroyed, the method of pole distribution is perfectly practicable and satisfactory in residential and business sections where service connections are infrequent and where a house-to-house system would not be economical."

On the ground of expense, many telephone companies have hesitated, and still are hesitating, to employ conduit systems, but the experience of the past has, in all cases, shown the wisdom of placing the wire plant in conduit, even in cases where the telephonic density is comparatively low. Experience has shown beyond a cavil that the annual charges of maintenance and depreciation upon pole lines are usually greater than the charges upon the capital invested in such a conduit system as will contain it. The watch-word of the Independents has been "GOOD SERVICE." The modern switchboard and the substation are so highly evolved that little complaint arises from their performance, but the old pole line is as inadequate and unsatisfactory as a magneto system. Modern practice is constantly reducing the cost of conduits and the expense of installing them, until now, underground lines in any but the most sparsely populated of telephonic districts, can be constructed more cheaply than overhead wire.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

RURAL HIGHWAYS IN OHIO.

We are constructing some farmers' lines west of here. About three miles out we are held up by two old ladies owning both sides of the road. Kindly advise, through your journal, the law concerning rural highways in Ohio, and the mode of procedure in a case of this kind. S. R. N.

THE statutes of Ohio provide that telephone companies may construct "lines from point to point along and upon any public road by the erection of the necessary fixtures, including poles, posts, and abutments necessary for the wires; but the same shall not incommode the public in the use of such roads." Further, "any such company may enter upon any land . . . for the purpose of making preliminary examinations and surveys, with the view to the location and erection of lines . . . and may appropriate so much thereof as may be deemed necessary for the erection and maintenance of its . . . poles, piers, abutments, wires, and other necessary fixtures, and for stations, and the right of way over such lands, and adjacent lands, sufficient to enable it to construct and repair its lines." Another section provides that "no such company shall, without the consent of the owner thereof in writing, enter any building or edifice, or use or appropriate any part thereof, or erect any pole, pier, or abutment in any yard or in any enclosure within which an edifice is situated, nor . . . erect any pole, pier, abutment, wire, or other fixtures, so near to any edifice as to occasion injury thereto, or risk of injury in case such pole, pier or abutment be overthrown, or injure or destroy any fruit or ornamental tree."

Interpreting this statute, the Ohio courts hold that it does not give the right to telephone companies to erect their poles and wires in a highway without first making compensation to the owner of the abutting property. It is therefore necessary for your company to either purchase the right of building your line from the old ladies who interfere with you or else to commence proceedings in court for the condemnation of the right of way you seek along the highway. This you can do under the statutes which accord the right of eminent domain to telephone companies. See Statutes, sections 3454-3471.

Smith vs. Printing & Tel. Co. 2 Ohio Cir. Ct. R. 259, 2 Am. Elec. Cas. 237.

PROPER LOCATION OF POLES.

THE Court of Civil Appeals of Texas has rendered a decision setting forth the rule to be followed by telephone companies in placing their poles in public streets. The suit was brought by one Billingsly against a telephone company to recover damages for personal injuries sustained by his wife in being thrown from a buggy by reason of the company's negligence in placing one of its poles in a street of Beeville, Tex. The defence was that the company was authorized to place its poles where it did, and that the pole with which the buggy collided was placed where it would not interfere with the safe use of the streets by the public. The pole was set at the intersection of two streets, 9½ feet from the intersection. Plaintiff recovered a judgment of $1,000. The court affirmed the judgment. In Texas telephone companies are authorized by statute, to set their poles between and across any of the public streets in the State in such a manner as not to incommode the public use of the streets. The decision said that courts are inclined to construe the right granted as subject to the implied condition that the poles shall not be so located as to be dangerous. It held that a telephone company was bound to use reasonable care in the construction and maintenance of its poles, so that travelers along such streets, in the exercise of ordinary care, shall not be discommoded or injured by coming in collision with them, and whether it has used such care is a question of fact for the jury. The defendant contended that the accident was really caused by the momentary swerving of the horse and not the location of the pole, but the court held the location of the pole to be the proximate cause of the collision. Alice, Wade City & C. C. Telephone Co. vs. Billingsly (Tex.), 77 S. W., 255.

DURATION OF CONTRACT FOR CONNECTIONS.

THE Constitution of Kentucky provides (Section 199) "that telephone companies operating exchanges in different towns or cities shall receive and transmit each other's messages without unreasonable delay or discrimination. The general assembly shall, by general laws of uniform operation, provide reasonable regulations to give full effect to this section. The Campbellsville Telephone Company built an exchange at Campbellsville; the Lebanon, Louisville & Lexington Telephone Company built an exchange at Lebanon, and the two companies then agreed to unite their lines at Phillipsburg, a point about midway between Campbellsville and Lebanon. This was done in accordance with a contract which required the two companies to transmit each other's messages over the lines so extended and connected. Both were Independent companies. Subsequently, a licensee of the Bell patents, the Cumberland Telephone Company, acquired a controlling interest in the stock of the Lebanon Company and built a line from Louisville to Lebanon, there connecting with the Lebanon exchange. Later an Independent line was built from Louisville to Campbellsville by the Independent Long Distance Telephone & Telegraph Company, there connecting with the Campbellsville exchange. When it was attempted to use the joint line by way of Phillipsburg, to transmit messages from Louisville to Lebanon by way of the Independent and the Campbellsville Companies, the Lebanon Company refused to make the connection at the Lebanon exchange, and excluded the message. The Campbellsville Company then brought suit for mandamus to compel the Lebanon Company to receive the messages over its wires, and to make the necessary connections therefor, thus seeking the specific execution of the contract between the two companies.

The circuit court denied the writ, from which judgment the Campbellsville Company appealed. In construing the contract there were two points that gave rise to controversy. First, it failed to state for what length of time the connection and the agreement were to continue. The Campbellsville Company contended that it was to endure at least during the corporate lives of the two companies. The Lebanon Company contended that it was determinable at the will of either of the parties. Second, did the contract include messages originating elsewhere than at Lebanon or Campbellsville or on the line between those points? The Campbellsville Company affirmed that it did; the Lebanon Company that it did not. The court held that the provision of the constitution previously quoted made it the duty of the two companies to connect, even though there was no penalty provided for failing to do so. It was therefore concluded that the contract was not determinable at the will of either of the parties to it, but that it must continue during the corporate existence of the two companies. Upon the second point the court sustained the contention of the Campbellsville Company, for the reason that the contract was construed by the parties, in their practical application of it, to mean that messages originating in Louisville, destined for Lebanon, might be passed by the Campbellsville Company through its exchange over the joint wires of the two contracting companies, to its destination. Judgment was accordingly reversed. Campbellsville Tel. Co. vs. Lebanon, Louisville & Lexington Tel. Co. (Ky.), A. S. W. 1114.

IN THE OPERATING FIELD.

MINNESOTA TELEPHONE ASSOCIATION MEETING.

THE Minnesota Telephone Association will hold a convention in Minneapolis on August 31 and September 1. Two meetings will be held and arrangements have been made to hold them at the fair grounds on the afternoon of the dates in question. Executive sessions will be held in the executive building on the fair grounds. A large number of interesting papers will be read and it is the desire of the association that as many telephone men as possible will be present.

INDEPENDENT TELEPHONY IN WHITLEY COUNTY, IND.

WHITLEY COUNTY, Indiana, is reported to have more telephones in service operated by one company than any other county in Indiana, averaging one telephone to every twelve inhabitants. In Columbia City and the towns of South Whitley and Churubusco, the figures are still more surprising, for they show one telephone to every seven persons. The Whitley County Company operates five exchanges, and since it has abolished toll charges, the demand for telephone service is unprecedented. Manager Thompson says that the company is now giving service to 1,500 subscribers, and at the present rate of increase it will connect with over 2,000 patrons before the close of the year. Since the February directory was issued, more than 300 new subscribers have been secured. The average number of new connections made during any week is in the neighborhood of 20.

READING A TELEPHONE CENTER.

THE Pennsylvania Telephone Company is now building a line from Kutztown, taking in Windsor Castle, Virginsville, Lenhartsville, Dreibelbis and Kempton. It will be seventeen miles in length and will be connected with the Kutztown exchange. Later on it is the purpose to build a line, taking in Dryville, Moselem Springs and Kirbyville. Other villages in the county that are now isolated from communication with the city will eventually be brought in touch with Reading. It is the purpose of the company to spread out in all directions so that in a few years every village and hamlet in the county will enjoy telephone service. All the large towns are now connected, and it will not be long before it will be possible to reach all sections of the county. The telephone officials are being besieged with applications for the service.

THE SITUATION IN EVANSVILLE.

THE Citizens' Telephone Company, of Evansville, Ind., capitalized by local merchants, withdrew its petition for a franchise at the last meeting of the common council. At the same meeting the Home Telephone Company, similarly organized by local capitalists, appeared and asked for a franchise. The new company agrees to pay the city $3,500 a year for the use of the streets and alleys.

The withdrawal of the Citizens' Company was by agreement with the Home Company, some difficulties having arisen with the earlier company due to entanglement in politics of the city administration.

This movement is to secure a franchise for an Independent company to operate in the city before the State Court of Appeals hands down its decision ousting the Cumberland Company. The latter company already admits its defeat at the hands of the Independent interests, and is making desperate efforts to secure a franchise from the City Administration. The decision of the court, if against the Cumberland Company, not only ousts its lines from the city, but makes it liable for a suit for the two years past that it has operated in the city without a franchise. If a franchise is not secured at once, Evansville will be without telephone service when the Cumberland is forced to quit business, consequently an early passage of the Home Company's franchise is looked for in order that its construction work may be well under way and a system near enough completed to give service when the decision of the court is handed down, which is expected to be not later than December 10th.

LOUISVILLE HOME COMPANY REWARDS OPERATORS.

IN all large companies traffic inspectors are employed whose business it is to make records of the time it takes operators to answer and also to look after complaints which subscribers may make regarding the service. Manager A. L. Têtu, of the Louisville Home Telephone Company in conjunction with this method of traffic inspection, instituted a series of prizes, amounting to $100 a year, which are to be distributed in amounts of $50 semi-annually to the five operators who show the best records for the preceding six months. The result of this incentive to good operating has been most remarkable. The winner of the first prize this time was Miss Theresa Dierkes, who answered 130 test calls made by inspectors from the subscribers' stations under the stop watch, each call being answered on an average of 1.8 seconds. In addition to this the young woman did not lose one hour during the six months nor was a single complaint registered against her, either from subscribers or supervisors. This is a most remarkable record, one that is seldom equalled and never excelled.

During the six months in which the test took place the total number of test calls made was 7,024. The total time required in answering was 16,158 seconds, or an average of 2.3 seconds per call. This, it is believed, compares most favorably with any other operating statistics. The prizes distributed were as follows:

	In Gold.
First Prize	$15.00
Second Prize	12.50
Third Prize	10.00
Fourth Prize	7.50
Fifth Prize	5.00

It appears from the above that Manager Têtu struck the right chord in appealing for the co-operation of the operators in improving the service, and it is certain from a financial standpoint that the amount of money distributed in the form of prizes is more than made up for by the increase in efficiency of operation.

THE ONTARIO COMPANY PROSPERS.

AT the semi-annual meeting of the directors of the Ontario Telephone Company, held at Oswego, N. Y., a semi-annual dividend of three per cent. was ordered. The report showed that the company's business is in a very prosperous condition, the increase for the past six months having been twenty per cent. The report on toll line construction was a very encouraging one and went to show that before the end of another three months connections would be made with Rochester, Buffalo and all the lake towns.

This company operates exchanges at Oswego, Hannibal and

Digitized by Google

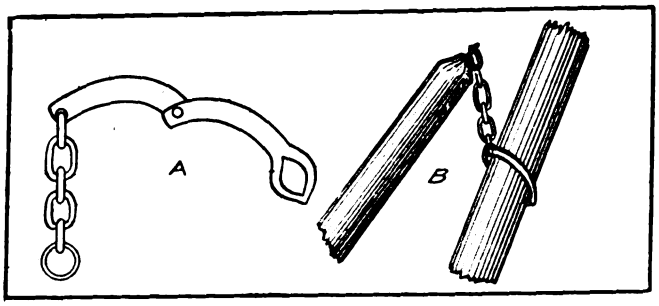
several other towns along the shore of Lake Ontario. A new directory, soon to be issued, will include one or two novel features. It will contain a classified business directory. The business houses will be separate from the private lines.

IMPROVEMENTS AT FORT ATKINSON, WIS.

THE Jefferson County Telephone Company, at Fort Atkinson, Wis., has recently completed the work of overhauling and repairing its outside construction, placing everything in first-class condition, and has also re-equipped the entire exchange throughout by installing a new 600-line capacity, self-restoring drop switchboard (400 lines being equipped at present), new protective devices, etc. The central office equipment, as well as the new telephones necessary to meet the increasing demadn for service, were furnished by the International Telephone Manufacturing Company, of Chicago. The Jefferson County Telephone Company is rapidly coming to the front as one of the most progressive Independent companies in the State of Wisconsin.

CLIP FOR POLE-RAISING DERRICK.

IN raising poles by means of pole-raising derricks one of the most important features is the clip which is used to hold the pole. This clip should be of simple construction, yet strong and sure of action. Mr. F. D. Byler, whose derrick we described in our issue of February 27, suggests the one illustrated herewith. Its method of application is apparent from the drawing in



which *A* represents the general detail of the clip and *B* its application. Care should be taken in its manufacture that all the parts are of a thoroughly substantial nature and that the clip is large enough to grip any sized pole, yet not too large to allow of its slipping.

LARGE IMPROVEMENTS FOR U. S. COMPANY.

THROUGH the consummation of a deal between the United States Telephone Company and a syndicate of Cleveland and New York capitalists the company has been able to borrow $450,000. By means of this loan a large number of contemplated improvements will be made that will enable the company to greatly increase its earning capacity. The United States company is now earning $400,000, and with the use of the major part of the loan it is confidently expected that $200,000 a year will be added.

CHICAGO TELEPHONE COMPANY IN A QUANDARY.

DEVELOPMENTS in the suit brought by Charles A. Brown, an attorney in Chicago, to prevent the Chicago Telephone Company from interfering with the use of a private branch exchange which he has installed in his office, tend to show that the Chicago Telephone Company realizes a position which is, to say the least, detrimental to its welfare. Our readers may remember that Mr. Brown installed a Stromberg-Carlson switchboard in his office for his private use and had connections made with the Bell lines entering the office. The suit is brought to restrain the Chicago Telephone Company from disconnecting its service from the switchboard. After delaying as long as possible the Chicago Telephone Company secured a change of venue from Judge Tuley, who had granted the injunction, on the ground that Judge Tuley was prejudiced, and had the case docketed before Judge Brown. On about the last day allowed under the rules of court the Chicago Telephone Company filed a general demurrer to the bill of complaint.

Mr. Brown's counsel served notice and had the argument on the demurrer set down for hearing. The court set aside a whole day for the argument, but on the day before the argument was to be heard the defendant voluntarily withdrew its demurrer and asked and obtained ninety days in which to prepare and file its answer. These ninety days have not yet expired. Should the case go against the Chicago Telephone Company, as is confidently expected, it will serve as a precedent to all parties throughout the country who may desire to install a branch exchange and compel any Bell company to connect its lines with the switchboard.

ANNUAL DINNER OF NATIONAL CO.'S STAFF.

THE eleventh annual dinner of the National Telephone Co.'s staff was held in London recently. The company numbered about 230, including several of the officers and representatives of the 12,000 employees.

The annual budget was read and showed that the company now had in Great Britain and Ireland 1,095 exchanges, an increase of 45 compared with the preceding year. There are now 300,000 subscribers' stations, an increase of 40,000 from the foregoing year. During the last year it was shown that 938,000,000 telephonic messages had been transmitted.

Within the last ten years the number of exchanges had increased 103 per cent. In the same interval the number of stations had increased from 80,000 to 300,000, or 275 per cent., while the number of messages increased 283 per cent. The gross revenue increased from £750,000 per annum to £2,000,000, while the cost per message had fallen from .72d. to .41d.

It was further stated that the telephonic service of the company was now better than that of any other European power, though behind that of the United States. The company had never been in a firmer financial condition than it was at present. A comparison of telephone conditions in the United States with those of Great Britain occupied the attention of a large number of the speakers.

A musical programme was rendered during the dinner. The camaraderie of the members of the staff, who all appeared to know each other and to appreciate keenly their annual reunion, made the affair highly successful.

THE SITUATION AT KINGSTON, ONTARIO.

THE question of a telephone franchise is agitating the city council of Kingston, Ontario. The agreement of the Bell Company expired some time ago, and its renewal is awaiting an understanding on several points. The Bell Company offers the city, in recognition of an exclusive franchise, the munificent annual sum of $700, exclusive of the value of its free telephones and also the use of its poles for fire alarm wires. This is desired for a period of five years. Other companies have requested that the exclusive franchise be not given to the Bell Company, several companies desiring permission to install systems. One of these is the Canadian Machine Company, another the Canadian Telephone and Telegraph Company.

It is very evident that there is a need for a hustling Independent man to take hold of the matter. Kingston is a progressive town, and it is certain that the people would rather see an Independent system installed with reasonable rates than to continue in the old Bell régime with its extortionate charges. What has been done in other Canadian towns is ample proof of the desirability of an Independent system which would be able to furnish service as well as is done by Independent companies in the States.

EXCHANGE VISITING DAYS.

AS a method of instruction for its subscribers, the Home Telephone Company, of Toledo, has introduced what are known as visiting days, when all who care to call may inspect the exchange and apparatus. The first two visiting days were July 21 and 22, the time being from 10 A. M. to 9 P. M. Quite a large number of Toledo people took advantage of this opportunity to learn something about the mysteries of a telephone exchange and its operation.

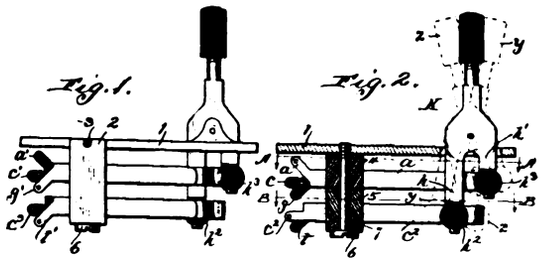
TELEPHONE PATENTS

SWITCHBOARD KEY.

W. E. McCormick, of Chicago, Ill., patents (No. 764,143) and assigns to the International Telephone Manufacturing Company, of Chicago, Ill. This is an invention to provide an improved key to be used upon the cord shelf of a switchboard, and is shown in Figs. 1 and 2. There is an escutcheon plate 1 which supports the key upon the cord shelf. To this a piece of insulating material



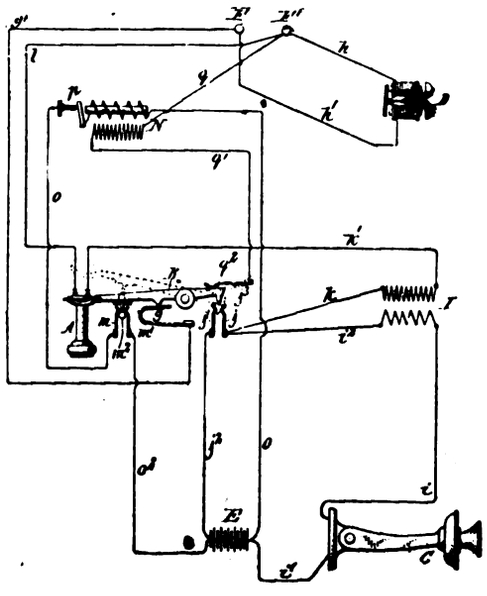
2 is attached which holds two sets of springs. These springs may be arranged in any desired manner to suit the circuit to which the key is applied. The lever of the key *K* has two rubber rollers *k2* and *k3* as shown in the figures. It will be seen from the drawings that moving the key in the direction of *z* will cause the roller *k2* to operate its springs, while in moving it in the direction of *y* the lower springs are unaffected but the roller *k3* operates the upper set of springs.

ANTISEPTIC ATTACHMENT.

J. Freel, Ladysmith, Canada, patents (No. 762,039) an antiseptic attachment for transmitters. The inventor provides a septum of silk or other material impregnated with an antiseptic compound which is to be stretched across the front of the transmitter funnel and secured in place by an elastic ring.

SUBSTATION SIGNALLING APPARATUS.

J. W. Mead, H. A. Mackie and Martin Van Buren, of Amsterdam, N. Y., patent (No. 764,139) and assign to M. Van Buren and J. J. Turner, of Amsterdam, N. Y., a telephone signalling apparatus. The object of this invention is to provide



a substation signalling apparatus which can be used in connection with local battery, and, at the same time, operate to signal the exchange by the simple removal of the receiver. The circuit is shown in the illustration, from which it appears that there is an induction coil *N* which is charged by means of the local battery *E*. There is also a contact breaker *P* in circuit with the primary of this coil. By operating the hook *B* a kick is produced in the line just sufficient to throw a drop or operate a relay.

PARTY LINE SYSTEM.

J. T. Fisk, of Adrian, Mich., patents (No. 763,972) and assigns to George P. Fisher, Jr., of Chicago, Ill., a party line system. This is a patent for a selective system applicable to party lines. The invention is based upon the use of the step by step mechanism, but is so complicated that it requires seven sheets of drawings and fourteen sheets of specifications and it is impractical to describe it in our limited space. Those who are interested therein will do well to obtain a copy of the original patent.

RINGING SYSTEM FOR TELEPHONE SIGNALLING.

T. C. Drake, of Malta, Ohio, patents (No. 763,971). The object of this invention is to provide an improved method for signalling substations so that the operation of ringing may simultaneously actuate the cut-off relay and thus expedite the making of connections. The general features of the system are shown in Figs 1. and 2, which are skeleton diagrams showing the ringer *c* at the substation, a line *c2* across which there is a relay *c3*, the central office being represented by a battery *c4* and a ringing

Fig. 1

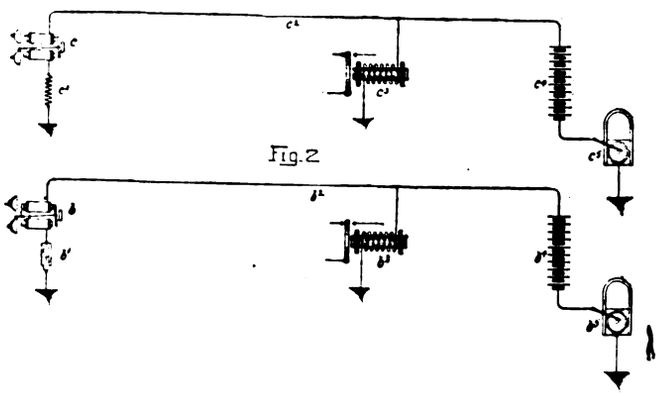


Fig. 2

generator *c5*. These diagrams show grounded lines, but a metallic circuit may be substituted for the ground. The essentials of the invention lie in the placing of the generator in series with the battery and so adjusting the relay between the spring of the battery, the resistance of the relay *c3* and of the resistance *c1* at the substation so that the battery may not be able to actuate the relay. When the ringing generator is operated sufficient current flows to draw up the relay armature and then the battery current holds it in place. A condenser may be substituted for the resistance *c'*, as is shown in Fig. 2.

IMPROVED HOOK-SWITCH.

A. B. Chance, of Centralia, Mo., patents (No. 763,464) an improved hook-switch. The object of this device is to provide a hook-switch so contrived that when the hook-switch rises it shall send to the central office a calling signal, and when it is depressed by the operator a disconnect signal will be sent. This is achieved by providing the switch with two springs which are operated by means of a pin on each side, one spring sending the calling signal and the other the disconnect signal.

IMPROVED TRANSMITTER.

A. J. Mundy, of Boston, and A. E. Smith, of Waltham, Mass., patent (No. 763,501) an improved telephone transmitter. The essential features of this device consist in filing the surface of the carbon electrodes of the transmitter with semi-circular grooves into which small rods of carbon, preferably lamp films, are placed, which form the microphonic contacts.

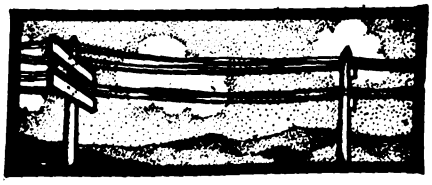
QUERIES

Questions on any subject relating to telephony will be answered on this page.



ALTERNATING RELAYS.—(383.)

Can you give a description of a relay that will operate on alternating current and not chatter so as to cut out the contacts operated by the armature? H. M. R.

The relay, as shown in Fig. 383a, will operate on alternating current without chattering of the contacts. This is due to the mass of the armature, which is made heavy, and therefore tends to remain in its upper position when current once operates it. A thousand ohm relay made similar to the above, having 14,500 turns of No. 36 copper wire, will operate at 75 volts, alternating

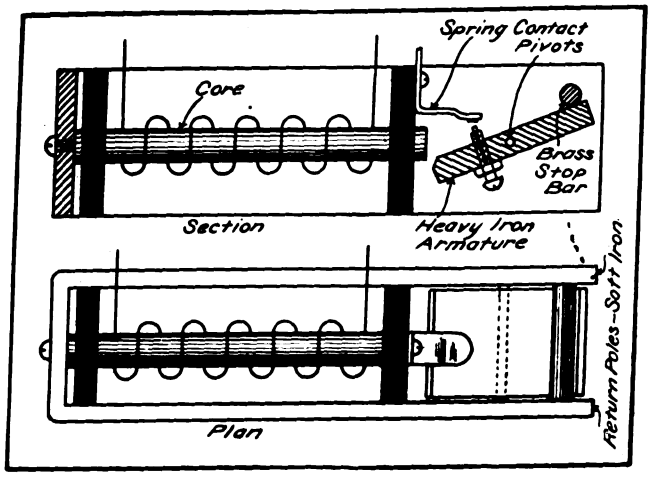


Fig. 383a.

current through 17,000 ohms and a two microfarad condenser in series; furthermore, it will not stick when its resistance is reduced to zero.

In Fig. 383b another type of relay is illustrated which will operate on alternating current without chattering at the contacts. Two coils are used, one receiving the line current direct and the other through the condenser. The condenser causes the alternating current to lead in phase so that whilst the current in coil *A* is neutral there is enough in coil *B* to retain the armature in its upper position.

BRIDGING TELEPHONES.—(384.)

Is it practical to have 10 bridging telephones on one grounded line when the ringers are only wound to 1000 ohms resistance and the line about 10 miles long? P. M.

It is our opinion that it is not practical to place 10 bridging telephones on a grounded line. The reason for this is twofold: In the first place, the resistance across the line in parallel is very low, being only 100 ohms. The line being 10 miles in length, the instruments nearest the exchange would receive a much larger amount of current than would those furthest away, consequently it is doubtful whether the instruments at the furthest end would ring at all satisfactorily, especially if the lines are iron wire. In the second place, grounded circuits, according to modern telephone practice, are undesirable, however, in country districts, where are there no disturbing influences, such as trolley or electric light lines, they can be used with a fair degree of success, the great trouble is cross talk. We would certainly advise, if practical, to put in another wire and make the circuit metallic, because under these conditions it is much easier to locate and clear trouble, and at the same time the service will be improved, and cross talk can be gotten rid of entirely by suitable transpositions.

TIME TO ANSWER.—(385.)

What is the average time for operators to answer on a magneto board? B. S. B.

It is impossible to give any average time required for operators to answer upon a magneto switchboard, because the time consumed will vary with the type of board and with the training of the operators. Thus, on a board equipped with automatic self-restoring drops, answering will be quicker than upon a board having mechanical drops, while the mechanical drop will be quicker than the old-fashioned drops in which each drop must be restored by the operator by hand. About seven seconds would be considered fair time, five seconds quick time, and ten seconds slow time.

GERMAN MANUFACTURERS.—(386.)

Will you please tell me the name of the maker of the German telephones described in your issue of June 25th. Q. N.

The telephone apparatus described is made by the firm of Mix & Genest, of Hamburg, Germany.

NOISY TRUNK LINES.—(387.)

We have two trunk lines entering our exchange, one of whcih is 25 miles in length and the other one only 4. Both trunks when connected to subscribers are quiet, but when connected together the circuit becomes very noisy. We have gone over all the connections and tested for grounds without finding any trouble. Can you suggest any reason for this phenomenon and also the cure?

The trouble of which you speak is one that is fairly common. The first remedy we would suggest is that you transpose both circuits. If this has already been done there is every reason to suppose that the noise is brought on by the short line connecting with the long one. Again, the long line may run through the country where there is no disturbance, whereas the short line may parallel or run near to trolley circuits. If this is the case, the inductive effect due to these causes may not be noticed on local connections with the short trunk while, when the short trunk line is connected to the long one, the inductive disturbance is extended throughout its whole length and would, of course,

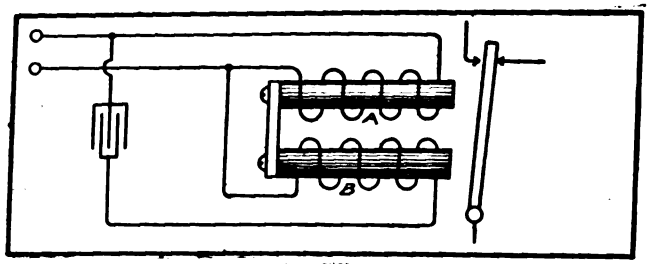

Fig. 383b.

cause the trouble you speak of. The resistance of both sides of the circuit should be found, and if there is any difference it should be remedied at once. One method of overcoming the difficulty of unbalanced connections betwen the trunks is to insert repeating coils, but this is not advocated except under exceptional conditions, as the insertion of the coil, although it may reduce the noise, at the same time, it will reduce the volume of sound, which is transmitted.

RESISTANCE OF BELLS.—(388.)

What resistance of magneto bells would be most satisfactory on a 20 party line ten miles long?

A 1600 ohm bell would be proportionate for the line mentioned.

BUILDING LINES.—(389.)

Our manager is putting up 12 miles of metallic circuit line. He says he will go over the line and transpose after the circuit is completed. Is this a good way to construct a metallic circuit? K. T. S.

Metallic circuit lines are invariably constructed this way, as it is impractical to make any transpositions at the time the line is being built, since the exact locations for the transpositions are not known and the amount of transposition necessary to clear the line of cross talk or inductive effects cannot be determined until the line has been built.

THE WEEK'S MESSAGES

FINANCIAL.

VALPARAISO, CHILE.—The annual report of the Chile Telephone Company showed a gross revenue of $916,542, an increase of $75,349. The expenditures were $422,409, an increase of $20,890. The net income from all sources was $494,133, an increase of $54,459.

DARLINGTON, ILL.—The Darlington Telephone Company has increased its capital stock from $1,000 to $10,000. The president of the company is Daniel Lewis.

BROWNSVILLE, IND.—The Brownsville Co-operative Telephone Company, of which W. H. Hawkins is president, has increased its capital stock from $2,000 to $5,000.

FRANKLIN, IND.—The Franklin Telephone Company has increased its capitalization to $5,000. Frank F. Smith is president of the company.

ADAMSVILLE, O.—The Adamsville Telephone Company has increased its capital stock from $10,000 to $30,000.

DAYTON, O.—A meeting of the stockholders of the Home Telephone Company will be held at the offices on the 12th day of August, 1904, at 2 o'clock P. M., for the purpose of considering and acting upon a resolution to increase the capital stock of the company from $1,000,000 to $1,200,000.

NEWARK, O.—The Newark Telephone Company has declared a dividend of 3 per cent. on its preferred stock.

PHILADELPHIA, PA.—The quarterly earnings of the Keystone Telephone Company for the period ending June 30 of this year, abounted to $86,240 against $53,787 for the corresponding quarter of last year.

PARKERSBURG, W. VA.—The West Virginia Western Telephone Company has purchased the plant of the Marietta Telephone Company, which it will absorb. The purchase price is stated to be in the neighborhood of $80,000.

FRANCHISES.

EVANSVILLE, IND.—The Evansville Home Telephone Company has asked for a franchise, the notable feature of which is that the company will deposit $3,500 with the city within ten days after the franchise is signed, this amount to be forfeited to the city if the actual construction is not begun within sixty days. Aerial lines are to be strung and an underground system is to be used in the down town section.

SOLA, KANS.—Arnitt & Hobartt, owners of the Sola Telephone Company, have secured a franchise at Greeley, Kans., for a telephone system, and will commence construction work as soon as material arrives. They have sixty subscribers to start with.

MIDDLEBORO, MASS.—A franchise has been granted to the Southern Massachusetts Telephone Company.

ASBURY PARK, N. J.—E. H. Snedeker, of New York, has asked the city council for a franchise to construct a telephone system at Asbury Park.

CLEVELAND, O.—A franchcise has been granted the United States Telephone Company to operate in Cincinnati. The exchange will be ready for service next September.

DAYTON, O.—The Middletown Telephone Company has applied for a franchise in Middletown. The company is capitalized at $10,000. Of this amount $10,000 has been subscribed and $100 of the amount has been paid in.

READING, O.—The Queen City Telephone Company has applied for a franchise to operate a telephone system in this village.

SUMAS, WASH.—J. H. Lochbaum and associates are petitioning the city council for a franchise to construct and maintain a telephone system.

POUND, WIS.—The Farmers & Merchants Telephone Company has been granted a franchcise by the town council to build a telephone line through the town.

COMBINATIONS.

MORAN, KANS.—The Moran Telephone Company has sold its exchange at Moran to J. J. Wilson. Mr. Wilson will make extensive improvements.

SALINA, KANS.—The Salina Telephone Company has sold that part of its toll line running between Sincola and Plainville to O. O. Spencer, of Wilson, Geo. Tolivar, of Lucas, and others.

SALINA, KANS.—The Salina Telephone Company has purchased the exchanges at Lindsberg and Marquette, along with 180 miles of toll line, running from Salina and Gypsum to Bushton.

EAST AURORA, N. Y.—The Haines Telephone Company has sold out its plant here to the Inter-Ocean Company. The new company has planned many changes and will spend considerable money in perfecting and extending the system.

LE ROY, N. Y.—The Pavilion exchange of the Home Telephone Company is soon to be combined with the Le Roy exchange. This will enable Pavilion subscribers to talk with Le Roy subscribers without paying extra toll rates.

HONESDALE, PA.—The Honesdale Telephone Company now has complete control of the Citizens' Telephone Company. Connections with Milanville, Carbondale, Scranton, Wilkesbarre, Rawley, White Mills, and other cities will soon be made.

ELECTIONS.

SANTA ROSA, CAL.—At the meeting of the Farmers Fulton Telephone Company No. 2, the following officers were elected: J. Eckel, president; John Faught, vice-president; James Wood, secretary and treasurer.

MONTREAL, CANADA.—The Canadian Telephone Company held its annual meeting recently and elected the following officers: G. G. Hurd, president; A. Adam, vice-president; A. G. Hurd, secretary and treasurer; W. T. Aoughtred and Joseph Lemieux, managers.

ALTON, ILL.—The Fosterburg-Wood River Telephone Company elected the following directors: Edmund Beall, D. M. Kittenger, J. P. King, W. H. Cartwright, J. S. Culp, and others.

MONMOUTH, ILL.—At the annual meeting of the stockholders of the Monmouth Telephone Company the following officers were elected: C. C. McClung, president; J. E. Lanphere, vice-president; H .B. Smith, treasurer; W. A. McQuiston, manager and secretary.

SHOALS, IND.—At the annual meeting of the Shoals, Indian Springs and Bedford Telephone Company the following officers were elected: Garret McDermed, vice-president; Capt. Monicle, president; Walter Jones, secretary, and William Mitchell, treasurer. J. N. Sims, M. Dillman, A. A. Thompson, C. Henshaw, B. S. Stapleton and William McCane, directors.

LA FAYETTE, IND.—At a meeting of the stockholders of the Hoosier Telephone Company the following directors were elected: Homer Fisher, Orleans; M. B. Hottel, L. G. Davis, W. H. Rudder, Salem; J. T. Stout, Paoli; John Stratton, Campbellsburg, and G. M. Morris, Canton.

MT. PLEASANT, IA.—At the annual meeting of the Mt. Pleasant Telephone Company the following officers were elected: W. J. Steckel, president; R. S. Galer, vice-president; E. E. England, secretary. A dividend of 5 per cent. was declared on the preferred stock.

MUSKEGON, MICH.—The Citizens Telephone Company of Muskegon held its annual meeting and elected the following officers: Thomas Hume, president; Dr. B. D. King, vice-president; L. B. Smith, treasurer; H. H. Mann, secretary, and William Robinson, manager.

WINDOM, MINN.—At a recent meeting of the Mutual Telephone Company the following officers were elected: H. E. Hanson, president; D. U. Weld, vice-president; J. J. Rupp, secretary, and Henry Sherman, treasurer.

WAKONDA, S. D.—At the annual meeting of the stockholders of the Wakonda Telephone Company, the following officers were elected: M. J. Chaney, president; F. A. Swezy, vice-president; Samual Jacobson, secretary, and L. O. Northrup, treasurer. Plans are being made for the extension of the local telephone system.

WEAKLEY, TENN.—At a meeting of the stockholders of the Weakley Telephone Company the following officers were elected: Hon. G. E. Bowden, president; T. H. Farmer, vice-president; R. W. Martin, secretary; T. H. Farmer, J. M. Gardener, F. J. Burchard, R. W. Martin, and Dr. D. W. Scotis, directors.

VIRGILINA, VA.—At the annual meeting of the Virgilina Telephone Company, the following officers were re-elected: E. Davis, president; W. W. Tuck, general manager; J. B. Wilborn, secretary and treasurer.

MISCELLANEOUS.

VALPARAISO, CHILE.—At the annual meeting of the directors of the Chile Telephone Company it was stated that there were 5,814 subscribers, a gain of 443 for the year.

IOLA, KANS.—The Iola Telephone Company will pay the city $300, which is 3 per cent. of its gross receipts for the past six months, for its franchise privilege.

HOPKINSVILLE, KY.—The Hopkinsville Home Telephone Company has completed its plant. The corporation has secured the city contracts to the exclusion of the Bell Company.

JIMIRIZ, STATE OF CHIHUAHUA, MEX.—The contract for a telephone system here has been let to Weisil & Kok, of Parral, Mexico.

ST. LOUIS, MO.—J. B. HOGE will attend a meeting of Independent telephone men who are working out the long distance problem. When the plan is completed the Independents will have long distance service to all of the principal points between Cumberland, Maryland, and Topeka, Kansas.

HASTINGS, NEB.—The Glenville-Inland Telephone line now has connection with other Independent lines whereby every town in the county can be reached.

NIAGARA FALLS, N. Y.—The Home Telephone Company will expend between $35,000 and $40,000 in improving the local service. A new exchange station will be built and the latest improvements will be installed.

CLEVELAND, O.—The United States Telephone Company has increased the wages of its fifty operators 10 per cent.

DENISON, TEX.—The Grayson County Telephone Company's exchange was damaged by fire to the extent of several hundred dollars recently.

FRANKLIN, TEX.—Mr. H. A. Hoges, of this place, has bought out the local telephone exchange.

SEARCY, TEX.—Mr. A. J. Searcy, of this place, has just put its line in good order.

OSHKOSH, WIS.—The Wisconsin Telephone Company had about 150 telephones burned out during a recent storm.

NEW COMPANY NOTES.

OKLAHOMA CITY, OKLA.—The Conway Telephone Company has been incorporated.

TRYON, OKLA.—The Lincoln County Rural Telephone Company has been incorporated with a capital stock of $5,000 by T. D. Rush, J. N. Smith and A. G. Walters, of Tryon, and William Teegarden and G. W. Howerton, of Carhey.

PRINEVILLE, ORE.—The Central Oregon Telephone Company has been incorporated here by A. L. Goodwillie and W. E. Guerin.

BETHEL, PA.—The Bethel Telephone Company has been incorporated with a capital of $5,000. Treasurer, Wm. F. Hammel, Finleyville. Directors: Wm. T. Phillips, James P. Wilson, Wm. F. Hammel, John Simmons, J. J. Snyder, James G. Holleran, Bethel township; Samuel F. Boyer, W. J. Anderson, Union township; O. C. Simmons, W. P. Simmons, Snowden township; Adolph Steding, Pittsburgh.

BROOKVILLE, PA.—The Red Bank Telephone Company has been incorporated with a capital stock of $10,000.

FINLEYVILLE, PA.—The Bethel Telephone Company has been incorporated with a capital stock of $5,000, by W. T. Phillips, J. P. Wilson, S. F. Hamill, John Simmons, J. J. Snyder, and others.

CONWAY, S. C.—A charter has been issued to the Conway Telephone Company. The capital is to be $3,000 and the company proposes to establish a telephone line between Conway and Marion. The officers are: R. B. Scarborough, president; H. P. Little, vice-president, and C. E. St. Amand, secretary.

LEXINGTON, S. C.—The Lexington Telephone Company has been incorporated with a capital stock of $1,000 by J. E. Kaughman and A. J. Fox.

WHEELOCK, TEX.—A new company has been formed here with J. B. Dunn, president; W. Curry, R. Killough, John Dunn, J. B. Dunn, directors. New lines are being constructed and the latest improved telephones will be installed.

PERSONAL.

I. B. CARPENTER has been promoted to the position of superintendent of the Providence Telephone Company.

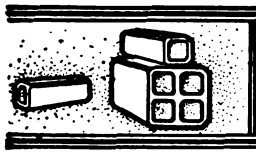
W. R. HARRIS, underground conduit designer and constructor, is now connected with the E. H. Abadie Company, Bank of Commerce Building, St. Louis, Mo. Mr. Harris will have charge of the company's construction department.

J. D. HOUSEMAN has been elected general manager of the St. Louis County Telephone Company, with headquarters at Clayton.

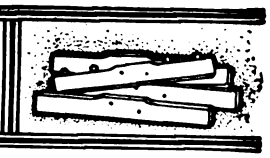
E. C. SHORE, late superintendent of construction for the Duluth Telephone Company, has been appointed superintendent of the Minnesota Telephone Company, and will have his headquarters at Minneapolis.

D. J. TOLMAN has resigned the managership of the Biddeford, Me., Telephone Company.

P. J. WEIRICH has been appointed manager of the Monroe Telephone Company, of Monroe, Wisconsin.



New Construction in the Field



BURBANK, CAL.—Work on the various local lines of the Home Telephone Company is progressing rapidly.

SAN DIEGO, CAL.—The Home Telephone Company is contemplating extensive additions to its service.

ST. JOHNS, N. B., CANADA.—The N. B. Telephone Company will erect a two-story building at St. Stephen.

DENVER, COLO.—The government will construct a telephone system to operate in conjunction with the Gunnison tunnel.

GLENWOOD SPRINGS, COLO.—The Colorado Telephone Company is spending $3,000 in putting in cable lines and erecting poles.

ROCKFORD, ILL.—Within the next two weeks the Home Telephone Company will have through connection through Beloit with the Badger State Telephone Company.

OTTUMWA, IA.—The Iowa Telephone Company will expend $80,000 in improvements at Ottumwa. A new building is included.

ROCK RAPIDS, IA.—A rural telephone line is being constructed between this town and Lester.

SIOUX CITY, IA.—The Sioux City Independent Telephone Company has purchased a site for its new exchange. The work on the building will be started shortly. The building will cost about $30,000.

BALDWIN, KANS.—Mr. Haas, of this city, will install a telephone system among the farmers at Worden township. He has 100 contracts to start with.

LINCOLN, KANS.—The Lincoln Telephone Company has installed a new 300-line switchboard, and is now in a position to take care of the increasing demand for rural telephones. It will build several new country lines at once.

PRESCOTT, KANS.—The farmers in this vicinity are extending their lines and will build a toll line to Mound City, Kans., as soon as poles can be secured.

TESCOTT, KANS.—The Tescott Telephone Company will build several rural lines in the near future. It has secured contracts from a great many farmers.

EVELETH, MINN.—The Missabe Telephone Company has been making extensive improvements to its system. The company has put in a new 100-line switchboard and lightning protector at Biwabik. An additional copper circuit is being constructed from Duluth to Hibbing for long distance calls.

WINDOM, MINN.—The Tri-State Telephone Company is extending its line from St. Paul to Winona. From Winona the system will be built west to Rochester, Owatonna and Mankato, connecting with the line to Worthington and Sioux Falls.

CLINTON, N. Y.—The Clinton Telephone Company will have its line in operation by the first of September. It is expected that the laying of conduits will be completed within six weeks.

FULTON, N. Y.—The Fulton Telephone Company has nearly completed its line between this city and Rochester. A new switchboard will soon be installed in the local office.

PENN YAN, N. Y.—The Crosby and Barrington Telephone Company will extend its line from the present terminal to Wayne via Keuka Landing. The work of extending the line will be commenced as soon as the material can be secured.

SAVONIA, N. Y.—At a recent meeting of the directors of the Campbell & Risingville Telephone Company, it was voted to put in four new lines between Campbell and Savona, and two between Campbell and Coopers.

UTICA, N. Y.—The construction work on the Independent long distance line is progressing rapidly. The new line will be connected with the Interstate telephone line here.

WHEELER, N. Y.—The Wheeler & Kanona Telephone Company is extending its system and is building a line to Prattsburg.

EDINBURG, N. D.—A telephone line has been projected from Gardar to this town. Hon. E. H. Bergman is president of the company.

GRAND FORKS, N. D.—The Tri-State Telephone Company is installing a first-class up-to-date telephone exchange in Grand Forks.

LITCHVILLE, N. D.—A telephone line is being built from Litchville to Marion.

MADISON, O.—The Madison Telephone Company has sold its Perry exchange to the Perry Company.

PRINEVILLE, ORE.—The Deschutes Telephone Company has begun the construction of a line to this place, which it is expected will be in operation by September.

FRANKLIN, PA.—The Citizens Home Telephone Company is preparing to extend its line. Some new cable construction is also contemplated.

MORRISON'S COVE, PA.—Work on the new telephone lines from Morrison's Cove has been begun. It is thought that the poles will be set by August 1st. It is further believed that by January 1, 1905, the line will be completed to Altoona.

PALMYRA, PA.—The Pennsylvania Telephone Company is installing a modern automatic telephone exchange at Palmyra.

POTTSVILLE, PA.—The Pennsylvania Telephone Company has presented an application for the right of way to run its wires through the borough.

READING, PA.—The Pennsylvania Telephone Company is extending its system in all directions from this city.

DEADWOOD, S. D.—The Home Telephone Company is rapidly getting its lines into shape, many of them being completed. General Manager C. Dunseth is very pleased with the number of new subscribers added since he took charge, many of the old patrons having returned. The line to Spearfish is completed; many new subscribers have been added. The Sturges line is working in first-class shape, and as soon as the Belle Fourch line is completed, the Sturges subscribers will be able to get connection.

Digitized by Google

TRADE NOTES

THE F. BISSELL COMPANY, of Toledo, Ohio, has placed on the market a new grade of flame-proof wire, under the heading of "Security." The insulation of this wire is absolutely non-inflammable, a feature much desired for this class of wire. The company will be pleased to send a sample upon request.

THE NATIONAL WIRE CORPORATION, of New Haven, will move its general and executive offices on August 1st to the Engineering Building, No. 114 Liberty street, New York. On and after the above date all communications should be addressed to the New York office, where the company will continue to give all inquiries, orders and correspondence prompt attention.

THE VOUGHT-BERGER COMPANY, of La Crosse, Wis., has issued a novel advertising folder in the form of a reply postal card. The desirability of the pendent for all purposes is set forth, besides a thorough description of the apparatus. On the reply half of the card is an order blank with prices of the various types of instruments. This card is to be used in sending for a trial instrument subject to 30 days' time for demonstration as to its practicability.

THE HARVARD ELECTRIC COMPANY, of 62 W. Van Buren street, Chicago, Ill., has an office at 136 Liberty street, New York, in charge of Mr. J. J. Waldman. A large stock of Harvard protectors and specialties is carried, enabling Mr. Waldman to fill all orders promptly. Parties visiting New York should call at this office and make it their headquarters. Visitors may have their mail addressed here, and Mr. Waldman will extend all the courtesy necessary to make their stay agreeable.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, of Buffalo, N. Y., is building a multiple switchboard that is entirely new in many of its features. The switchboard is especially adapted to exchanges where floor space is limited. The construction is of iron and the boards are built of one position units. The cabinet contains the line and supervisory relays and condensers, also the main and intermediate distributing frames, there being room for a man to work conveniently inside the switchboard. All wiring and apparatus is so arranged that inspection can be made very readily.

THE DOUBLEDAY-HILL ELECTRIC COMPANY, of Pittsburg, Pa., has just issued the largest catalogue of electrical supplies ever put out. It contains 1,068 pages and is closely packed with interesting matter from cover to cover. A large section of the catalogue is devoted to telephone specialties, and this section is so arranged that operating companies find all their needs, no matter of what character, catalogued in a compact yet comprehensive form. Unlike some of the other supply houses, the Doubleday-Hill Company does not issue its telephone section in the shape of a separate catalogue, as the house argues that there is hardly an item in electrical equipment in which the telephone operator is not more or less interested. The entire catalogue is therefore sent on request. This huge volume is a fair index of the rate at which the business of Doubleday, Hill & Company is growing. The main reason for their growth is undoubtedly to be found in the unusual facilities they have for handling business at rock bottom prices. They handle the total output of a crossarm factory, and control also a pin and bracket factory. In other lines they have similar advantages, so that they have ready for immediate shipment the largest stock of general construction material of any house in the country. Pittsburg being the center of the brace and bolt trade, Doubleday, Hill & Company have, of course, command of a close and easy market in these lines, as they have in porcelain insulators, the making of which also centers in Pittsburg. Altogether the house has exceptional facilities, and it is always ready to quote prices for quick shipment. Inquiries of every character are solicited and prompt attention to all communications is guaranteed.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE—The Ottumwa Telephone Company's plant at Ottumwa, Iowa, including Franchise and all its property. The Company owns the three-story brick building, built two years ago, in which is installed a Central Energy System, equipped for 1,540 full metallic lines, with selective ringing apparatus, all of the latest and the best. 1,250 telephones are installed, with 250 names on the waiting list. The Company also owns 80 miles of toll lines. This is one of the best telephone propositions in the State of Iowa. For full particulars, maps and photographs, address the Citizens' Saving & Trust Company, Cleveland, Ohio, or Henry S. Herr, Ottumwa, Iowa. 187

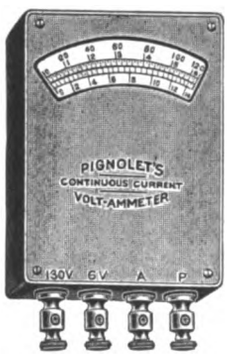
NEW YORK CHICAGO CLEVELAND
SAN FRANCISCO PHILADELPHIA ATLANTA

You Will Find It Pays To Test



your lines periodically for insulation and resistance, This can be best done with a Volt Ammeter. Mine are especially designed for this branch of telephone work and are low in price.

LOUIS M. PIGNOLET

Originator of the Voltmeter Habit. **78 CORTLANDT ST., NEW YORK**

One Man

out of one hundred interviewed said he preferred a monthly paper.

"Why?" he was asked.

"Because" said he, "the monthly is larger."

He was not pressed to subscribe to The American Telephone Journal, because—well the reasons are entirely obvious.

THE AMERICAN TELEPHONE JOURNAL

Have you ever Wondered?

how you get Fifty-two numbers of THE AMERICAN TELEPHONE JOURNAL for One Dollar?

F. H. Curtiss of the Kansas City (Mo.) Home Telephone Co. is one of the many known to the Editor that have been puzzled. Mr. Curtiss when renewing his subscription wrote:

> "A Dollar seems a very small amount to remit for such a 'Good Thing.' To think: 'Fifty-two times a year.' How can you do it?"

The fundamental reason lies in the very excellence of the editorial contents which surprises (and delights) our subscribers.

By publishing the best paper, we secure more paid subscribers than all other papers combined; we also secure our subscribers from the highest ranks of the industry.

Advertisers secure the best results from the JOURNAL, because of the number and standing of its readers. That's where the money comes from.

PAUL LATZKE, President WILLIAM H. McDONOUGH, Editor

MULTIPLE CABLE DISTRIBUTION

By Edward A. Tyler.

ARTICLE I.

IN the designing and construction of a telephone system the part of the work needing the most consideration and the best judgment is the wire plant. Switchboards are switchboards, and no matter what the merits may be of the different types considered, whether magneto, central energy, or automatic, the main factors to be considered are cost and efficiency. But in the case of the wire plant there are numerous other conditions to be met and satisfactorily disposed of, which require a large amount of foresight and engineering skill.

There are the different methods of distribution to be considered by the engineer of a system, viz.: 1st, underground; 2d, open wire aerial; 3d, cable aerial. Besides these three divisions there are combinations of them which offer advantages under special conditions. Of these combinations it is the purpose of this article to treat with the one known as multiple cable distribution. Before proceeding, it must be understood that the following description is not the only method employed to attain the desired ends, nor is this article intended to champion the multiple method of distribution, but only to serve as an example. With these facts in mind, I will describe the general application of this system of distribution, starting first with its designation.

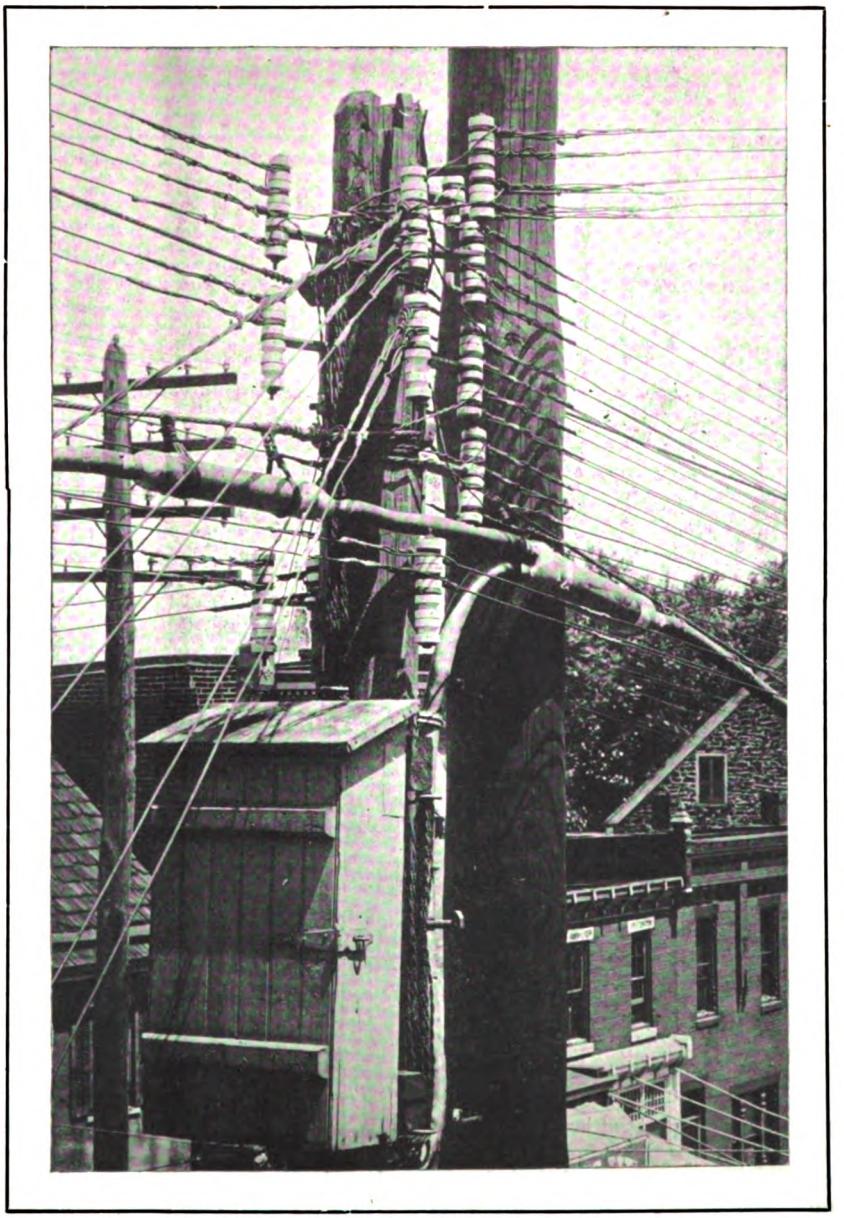

Fig. 1. Loop Pole.

Multiple cable distribution is a method of line construction in which the cable pairs of a system are available at different terminals, to provide for the constant and unforseeable change in location of substations and for the inevitable differences in estimated growth, which cannot be determined. The necessity for such a system depends entirely upon the class of service given, *i. e.*, whether it is to be private wire or party lines. It is obvious that in the case of direct or private wire service that there is less need for any circuit appearing at more than one terminal; whereas, in the case of party lines, the availability of a circuit at several points is much to be desired. As an illustration, Mr. A., whose line number is 861, moves to another street. In reconnecting his telephone, all that is necessary is to provide a new pair at the desired terminal and transfer the cross-connections of his line number on the main distributing frame from the old line conductors to the new ones. In this case it is evident that a multiple of the conductors used at the old terminal appearing at the new one would only be a waste of wire, since it would be dead, or in other words, unavailable for any other circuit.

Now let us consider the case from the party line standpoint. Mr. B., whose telephone number is 1326a, moves to another locality on the same loop line. If the terminal nearest to his new residence should have a multiple tap of the conductors used for his previous connection, he is able to retain his old number, whereas if there is no multiple, a new number will have to be assigned. Supposing, however, that multiple distribution is employed but that the old cable pair does

Digitized by Google

not appear at this terminal. It may be found that there is a pair which appears at the terminals from which the service wires of the other parties on this line are taken off and which is not in use; then it is an easy matter to change the lines of all the parties to the new conductors and also to transfer the jumper on the main distributing frame to the new pair. Making this transfer is sometimes termed "making a drop," and will be gone into more fully later, since the great advantage of multiple distribution lies in the availability of pairs for making drops.

The general method of distribution employed in this system is

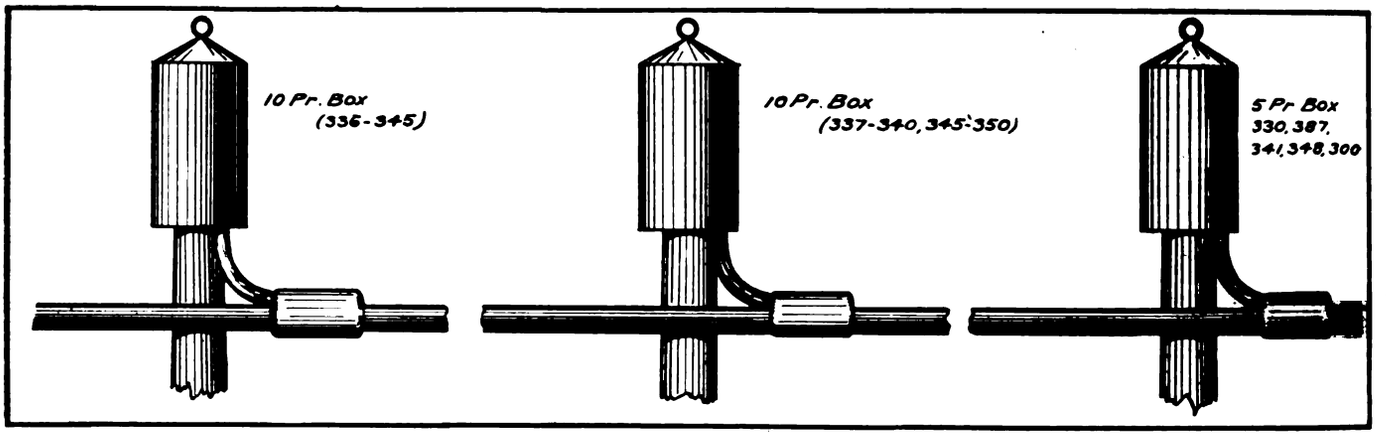

Fig. 2. Showing Method of Distribution.

a combination of aerial and underground cables, the underground cables bringing the lines from the exchange to what are termed loop poles, Fig. 1, the aerial cables forming the multiple distribution system. The loop poles are so termed because they are the terminal poles for the loop circuits. In general practice a pair in the underground cable only appears at one loop pole, it having been found that the maximum of efficiency in conjunction with economy of wire is thus attained. From the loop poles aerial cables are run off, and at specified intervals taps are made and certain pairs are taken off at distributing boxes, to which the subscriber's service wires are connected. In general the loop boxes accommodate 50 pairs, the aerial cables being either 25 or 50 pair capacity. Some loop poles, however, are much larger, having as high as 150 pairs, but these are exceptions. The highest point of efficiency would be attained by making each pair appear at every distributing pole, but in general practice a method called "over lap" is used. To better understand the system let us consider a specific case, illustrated in the diagram, Fig. 2. Here we have three distributing boxes, two of ten pair capacity and one of five. On the box to the left pairs 336 to 345 appear; at the next pairs 337 to 340 and 345 to 350 are available, and at the 5 pair box there is an indiscriminate number, 330, 387, 341, 348 and 300. Considering the ten pair boxes, it will be seen that pairs 337 to 340 and pair 345 overlap or appear at both boxes, thus it is apparent that a certain call number can be used for a subscriber whose service lines are connected to one of these boxes, and that if he moves to a district served by the other box he will still be able to retain it. In the case of the five pair box, pair 341 appears at the left hand ten pair box, and pair 348 at the centre box.

For ease in identification, the various loop routes of a system are designated by numbers, and the system itself, if having more than one exchange, is also subdivided. For instance, in a city there are three exchanges, Main, Gerard, State. All the loop poles associated with the Main exchange would be termed M loops, and would be numbered M1 M2 and so on. Now the distributing poles that are connected with a loop are also numbered, and besides have the loop initial and number prefixed to their own; that is, M6-23 would be distributing pole 23 on loop M6 line. In some cases all the poles are numbered on a loop line, the distributing pole number being also the pole number. As an example: on a loop line there may be 40 poles; of these, numbers 10, 20, 30 and 40 are distributing poles. There is an advantage in numbering all the poles, that it acts as a guide to location and also serves as a ready reference to locality and distance.

In Fig. 3 is illustrated a plan of distribution by means of a 200 pair underground cable and three loop lines. The underground is indicated by the dotted lines to distinguish it from the aerial cables. The exchange is shown at G, consequently the loop poles are prefixed with the same letter. It will be noticed that there are two sections to the underground, each of which consists of 100 pairs. The section including pairs 1-100 pass on to another locality and would be outlined on another map. At some future time it is probable that these two hundred pair sections will be drawn out and a two hundred pair cable used instead. The general scheme of overlapping will be seen from the diagram and requires no extra description.

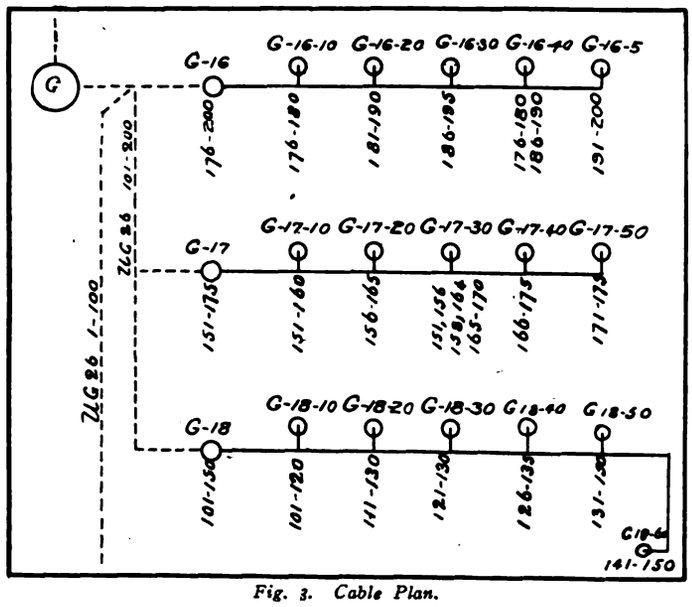

Fig. 3. Cable Plan.

Fig. 4 illustrates the method of distribution. Attention is called to the two cables. It often happens that a loop line is only completed for a short distance, in which case a 25 pair cable would be ample. But as the system grows the loop line is extended. To take care of the additional points of distribution a new cable is run from the loop box, which saves the expense of taking down the old cable and replacing it with a larger one to fit the new conditions over and above that which is necessary to run the additional cable.

In many instances the loop box is also used for distribution, as is the case in Fig. 1. There are some points of interest in line construction shown in this illustration which are worthy of passing notice. It will be seen that instead of twisted pairs that single lines are used for service distribution, although the jumper wire forming the connection between the terminals within the box and the line conductors is of the regular type. The reason for this is that in long swings the friction of one conductor upon the other, especially in windy weather, impaired the insulation to a great extent, and necessitated the renewing of the service lines more often than the income from the circuit would warrant.

FROM THE ENGLISH STANDPOINT

"OH! wad some power the gift to gie us to see oursel's as ithers see us."

Our English cousins are beginning to discover that the rule of the Bell is not altogether desirable, and are commencing to consider the advisability of securing telephonic service in some other fashion. But instead of a commercial development which is Independent, English telephony has taken on a municipal form, a number of exchanges having been established in several of the prominent cities under municipal control. The operations of these English systems have been recently described in a paper by Mr. A. R. Bennett, a telephone engineer of even trans-atlantic notoriety, presented to the meeting of the Institute of Electrical Engineers at Glasgow.

In the beginning Mr. Bennett gives the history of the various exchanges. The first was that of Guernsey, established in 1898. This exchange has now 1,230 telephones, and as the population of the island is only 40,300, it appears there is nearly one telephone to every 33 inhabitants, a percentage which has rarely been exceeded. For the year ending December 31st last, this exchange shows a net profit of £201, after providing for interest, sinking fund, etc., and as orders continue to be received the telephone possibilities of Guernsey are by no means exhausted.

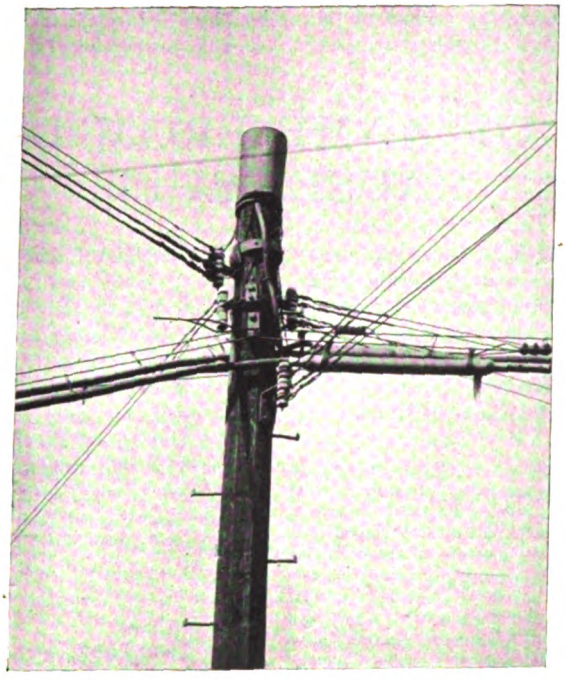

Fig. 4. Distributing Pole.
"Multiple Cable Distribution"—see preceding page.

The second exchange, and the one to a description of which the bulk of Mr. Bennett's paper is devoted, belongs to the Corporation of Glasgow, and commenced operation March, 1901. This system started with 3,000 subscribers and has now 11,200. The balance sheet for year ending May 31, 1904, shows a gross income of £50,968 and a net revenue of £20,519, leaving a surplus after providing for interest on capital invested, and sinking fund, of £3,650. The third of the so-called corporation exchanges is that of Tunbridge Wells, where originally provisions for only 300 lines was made, but in a few months subscribers had increased to over 900. Unfortunately, the Corporation of Tunbridge Wells was so weakly supported that subsequently it allowed its exchange to be purchased by the National Telephone Company, and it passed under Bell control. Nevertheless, as the Corporation secured a profit of £3,000 over and above installation and operating expenses, the enterprise certainly, from a commercial standpoint, has been a success. The fourth exchange is that of Portsmouth, opened March, 1903, now carrying over 1,700 telephones, showing for the first year a profit of £1,000. The fifth exchange is that of Swansea, opened in August, 1903, having now 800 telephones connected. As this plant is of recent origin, statistics for a full year's operation are unavailable. The last exchange is that of the Corporation of Brighton, opened in November, 1903, with 900 telephones, having now over 1,000 telephones in service.

The statistics presented by Mr. Bennett are extremely encouraging, and as the adviser of the largest of these corporations we must certainly congratulate him upon the excellent showing which this form of English telephony has made. Unfortunately, when the author comes to describe the technical side of the telephone systems, particularly that of Glasgow, which have been installed under his immediate supervision and in accordance with his recommendations, one stands aghast at the telephonic ignorance displayed, and we sincerely recommend Mr. Bennett to take a short educational vacation to be spent in the United States, where we can assure him of a hearty and open-armed welcome, and where it is certain that he can, if he so desires, acquire much information concerning modern practice of telephony.

It seems that in Glasgow there are nineteen switch rooms (English vernacular for branch office). In fourteen of these the so-called *"Bennett Ring Through System"* has been installed, while in the other five the old, antiquated and utterly obsolete call wire system is in vogue. American engineers will probably hardly understand what is meant by a ring through system, and for their benefit we hasten to explain that in a ring through system a subscriber calls the office and is put in communication with his desired correspondent by the operator. There the operator's work ceases and the subscriber is expected to continually grind the crank of a magneto until the wished-for correspondent appears at the telephone. In America the proposition to install a telephone exchange with anything but automatic signalling would be received with a smile of derision, while to make subscribers ring each other, for themselves, would create a guffaw that, we believe, would resound even across the Atlantic. But Mr. Bennett, in apparently all seriousness, points out that by this method the telephone company can unload on to the subscriber a portion of the legitimate work which belongs to the operator, and thereby save itself expense and trouble. This is not in accordance with the American Independent watchword, "Good Service," whatever our Scotch friends may believe. For the larger offices in Glasgow the old-fashioned call wire of the Law system is installed. The objections to this method are so numerous and so obvious that America entirely discarded the last exchange built upon this plan ten years ago, and no American telephone engineer would for a moment give the slightest consideration to an exchange involving this method of operation. To discuss all the experiences which led America to abandon the call wire would be to rehash history which is too trite for the columns of an up-to-date technical telephone journal. In a half-hearted way, Mr. Bennett endeavors to defend the use of the call wire and the ring through system by the extraordinary plea that the automatic signal common battery system is controlled by the Bell interests, while it has received a slight development in America among the Bell companies, is by no means sanctioned by good telephonic practice. If Mr. Bennett will accept our invitation to visit these shores we can easily show him that the bulk of the telephones in America, whether Bell or Independent, are operated by common battery systems, and that, in some respects, the Independent interests can show common battery circuits which in theory are better, and installations which are superior to those of the Bell companies. For example, the Independent exchanges in Philadelphia, Rochester, Buffalo, Cleveland, Los Angeles, and a host of other smaller places are entirely common battery. And when Mr. Bennett asserts that common battery transmission is not as good as that furnished by local battery, he assumes a position from which he could be statistically hurled without the slightest difficulty.

The cables used in Glasgow are said to be air space cables

Digitized by Google

chiefly laid in underground conduits. The wire is No. 22 and No. 20 gauge, depending upon the length of the subscriber's lines. The largest cables are reported to contain 217 conductors in a space of 2.75 inches. And when subsequent to the discussion of the paper, it was pointed out that 400 or even 600 pair cables were now common practice, Mr. Bennett defends the adoption of the 200 pair cable upon the ground of the superior talking secured by a capacity of .07 m. f. per mile. How Mr. Bennett can perform the gastronomic feat of straining at so small a transmission gnat as one or two hundreds of an m. f. capacity per mile length of line and swallow the camel of the impoverished talk of the average local battery is difficult to see.

In the construction of the underground conduits a large proportion of three-inch cast iron pipe is laid, which is said to have a cost upwards of 6 pence per foot. To install the best possible plant for a telephone exchange is the height of wisdom, but Mr. Bennett displays remarkable powers of logic when he is able to convince his board of directors of the desirability of using cast iron pipe at six pence per foot when terra cotta pipe, which is more durable and equally efficicious, can be obtained for a penny.

That English telephone engineers, on the whole, did not entirely coincide with the views expressed by Mr. Bennett, was forcibly brought out in the discussion which followed the reading of this paper. In defence of the call wire and ring through systems the author alluded to the difficulties and troubles experienced with relays in the newer forms of switchboard. In this connection Mr. Gill, of the London system, showed that in the London board, using 6,700 cut-off relays, there were 178 cases of trouble in a year, equivalent to .026 faults per relay per year, or one fault for each relay in 37½ years. And if the line relays be included, with which there is less difficulty, there was but one fault per relay in 50 years. Contrasted with the amount of trouble with the series jacks of the Glasgow board, which Mr. Bennett admits, relay trouble seems to be too insignificant for even a passing thought.

Such are a few of the many interesting and extraordinary features in the Glasgow Corporation system to which Mr. Bennett calls attention, but the most valuable feature which this paper emphasizes is the appreciation which Scottish subscribers accord to the service afforded. If a telephone system so designed as to inflict five or six different methods of operation upon the subscribers within the limits of a single city; that requires its patrons to do their own ringing with the obsolete magneto, or makes them wait their turn upon a call wire; and installed with so lavish and extravagant a hand as to employ six penny iron pipes in its subway system in lieu of one penny clay ducts, can be shown to earn £20,000 on a subscription list of 12,000 subscribers, what would be the result if a uniform and modern automatic signal common battery installation was substituted?

OMISSION OF NAME FROM DIRECTORY CAUSES SUIT.

THE State of Indiana on behalf of Ashjian Bros., rug manufacturers of Indianapolis, has made a motion in the Superior Court in that city for a writ of mandate upon and $5,000 damages from the Indianapolis Telephone Company because of the latter's omission to put the name of the firm and its telephone number in the last issued Telephone Directory. The firm had a telephone put in their place of business in March, 1902. The complaint reads in part:

"The company installed in said place of business of relators one of the telephone instruments, assigned the number 6403, under which they might enjoy all the benefits and privileges of the telephone plant; and it thereupon became the duty of the company, as an inseparable part of said general telephone service, to supply to relators as one of its patrons, all the necessary and proper connections and facilities for the prompt, quick, successful, correct, economical and advantageous use of said telephone instrument, so that they, at their place of business, in calling and conversing with others and also by other patrons at their homes or place of business in locating, designating, calling and conversing with relators, all without any discrimination against relators, as one of such patrons of the company, and without the imposition of any condidtion or restrictions upon relators not imposed impartially upon all other patrons. That for the express purpose of making it possible for its patrons to comply with the rules and regulations of the company and to call and be called by number only, in compliance therewith, and for the further express purpose of informing all the patrons, including relators, of the correct and true number and numbers by which and through which any and all of said patrons could call and be called, through said exchange, said company issued a book called a "Telephone Directory—New Telephone Company, Indianapolis, Indiana," and delivered a copy thereof to each of its patrons, which book undertook to contain and set forth the true and correct name of each and every one of the several patrons of said company at the date of the issue thereof, the kind and character of the place where each and every one of said patrons were located, and the street and number thereon where each and every one of said patrons were located, in alphabetical order, from A to Z (inclusive), together with the number by which patrons might call and be called, set opposite, in bold type, each and every one of said names of said patrons; and also undertook to contain a true and correct business classification of the names of all its said patrons from "Abattoir" to "Y. W. C. A." inclusive, in which said alphabetical list of patrons the true name, number, business, street and number of patrons were correctly set forth, as "6403—Ashjian Bros.—Rug Factory—460 West Seventeenth" and in the classified list, as "Rugs"—"6403———— Ashjian Bros." That said telephone directory was the sole and only guide and the sole and only source of information of and to said relators of and concerning all other patrons of and concerning relators as patrons of the company and was a necessary, inseparable, and indispensable adjunct and facility of and to the telephone service which it was undertaking to furnish to the general public, including relators, for the prompt, quick, successful, correct, economical, advantageous and valuable use of said telephone service and without which said service would be practically valueless to each and all the patrons."

The complaint further alleges that the directory is of "great and incalculable benefit and advantage" to the relators in furnishing them with the only proper and obtainable means of communication with all other patrons of the telephone company; that by omitting their name from the directory the company reclaimed and took out of the hands of its patrons and thereby withdrew from them the only source of information the patrons could obtain concerning the relators and held out and represented to its patrons that relators were not patrons of the company and could not be communicated with over its telephone lines. It is set out that the relator's place of business is far distant from the business district of the city and remote from street car transportation, on account of which they rely upon the general telephone service of the company in a large measure for the transaction of their business.

By the omission of their names from the directory it is claimed they have suffered damages in the sum of five thousand dollars. The relators have paid their telephone rent to July 1. They ask the court to compel the company to insert in every copy of the directory in the hands of its patrons the name, telephone number, etc., of the relators. The telephone company has not yet filed its answer but it is understood that it will hold that the directory is not a part of the telephone service and is not essential in order to enable its patrons to get telephone service. The new directory was issued only three months ago. The name of the complainants was accidentally omitted. One or two other omissions were caught before the book was bound and were made to appear on inserted slips between the proper pages.

As the complainants paid $10 for the three months' service and claim a $5,000 loss because, as alleged, the service is not complete, it is apparent from their complaint that an investment of a few dollars for an Independent telephone in Indianapolis brings mighty good returns.

COMPOSITE SYSTEM FOR UNION PACIFIC.

THE Union Pacific Railway has been experimenting the last four months with a telephone system of its own in its shops and offices at Laramie and Cheyenne, Wyoming. A station was also put in at Buford, where the gravel pits are in operation. The telephones were connected directly with the telegraph lines and the same current used for both telegraphic and telephonic purposes.

THE INDEPENDENT OPPORTUNITIES IN VIRGINIA.

OPPORTUNITIES for the construction of Independent telephone systems are to be found throughout the States, but in no section of the country are there to be found so many and varied propositions of interest in the Independent telephone field as in the South. Starting with Richmond, Virginia, which is now Bell, a good Independent service at reasonable rates could in all probability secure from 6,000 to 8,000 telephones. Petersburg, Virginia, 22 miles south, also supplied by the Bell system, could support from 1,000 to 2,000 Independent telephones. Newport News, Virginia, is another town where an Independent company should be able to achieve first-class results. Besides these there are the towns of Danville, Reedsville, Greensboro, Winston-Salem and Salisbury, which have no Independent service. Adjacent to the towns mentioned there is good farming country with

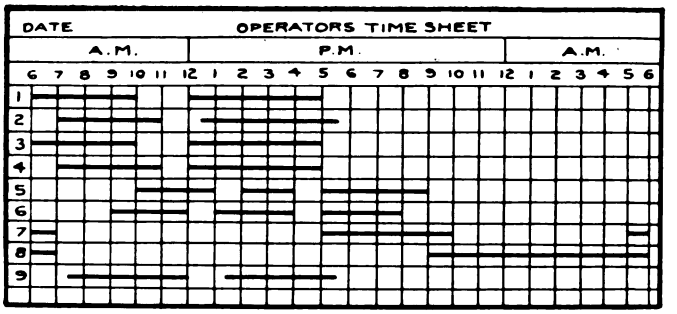

Fig. 1.

country villages and stores, making the situation a very desirable one in which to develop Independent systems. The cost of building is very much cheaper than it is in the North or West, consequently from a financial standpoint the outlook is very encouraging.

In the matter of construction, in very few places would it be necessary to blast holes for pole lines, and on account of the temperate weather, construction work could be carried on at practically all times. As a suggestion, some of the country lines might be built by the farmers and connected with the switchboards of the town systems. Farmers would in all probability buy their own telephones and could be expected to pay at least 50 cents per month for connections given them. Each town is a center for the farming communities. In this way toll connections could be secured through the various exchanges which would add a good deal to the revenue of a system. It would be necessary for each exchange to join with the others in the construction of a general toll system, the territory between each being proportionately divided.

Aside from the cities mentioned, the following towns have Independent systems in operation: Suffolk, which is 67 miles from Richmond, has an Independent system with good country connections. The Independent exchange at Norfolk connects with the Suffolk system. Blackstone, which is 37 miles from Petersburg, is also Independent, as is Crewe, which is 11 miles away. Lynchburg is another Independent town, as are also the towns of High Point, Thomasville, Lexington and Concord.

The people are generally dissatisfied with the Bell methods of business and will readily take up Independent propositions which are sincere. The trouble has been heretofore that in some cases the Bell monopoly has scared Independent companies into some traffic arrangement with them, which, when the deal had been completed, the Independents found themselves at the mercy of the Bell interests. A general uniformity of action between Independent companies of the South would surely bring forth as good results as has been the case of the Independents in Ohio, Indiana and Iowa. Southern people are not hard to please and yet they are not less human than their northern brothers. If the opportunity were offered them to secure the same telephonic advantages as have the inhabitants of the Northern States mentioned, there is not a question of a doubt but that the Independent movement not only in the State of Vinginia, but throughout the whole South, would be as successful as any others throughout the whole length and breadth of the land, which have taken up the cause of decent service and reasonable rates.

The miserable methods of the Bell systems have caused the subscribers to pay more for their service for one year than does the average Independent company charge for two. This difference of rates is used by the Bell company in other sections of the country to enable it to throttle competition by means of rate wars. The claim of the Bell companies of the South has been that the Independents have no long distance connections. It is thoroughly certain that not 15 per cent. of the people in Virginia use long distance lines, so that this croak of the monopoly which has been used to prevent Independent telephony is but another instance of a pernicious method employed to scare away investment in Independent telephony.

KEEPING OPERATORS' TIME.

By C. O. Nicholas.

ONE of the most important duties of a chief operator is the time keeping of the operators in her charge. The writer suggests the following method, which is simple and which has the added advantage of giving a ready reference as to the exact time which an operator spends at the switchboard during the various hours of the day, and also allows the best distribution of operators.

Fig. 1 is the form to be used for the Daily Time Sheet, and should be ruled as indicated. Each of the operators should be given a number by which they should be known. These numbers are placed in the left-hand column. Now the heavy dark lines indicate the hour that each operator is on duty. For instance: Operator No. 1 is on duty from 6 A. M. to 10 A. M., from 12 M. to 5 P. M. Operator No. 5 is on duty from 10 A. M. to 1 P. M.,

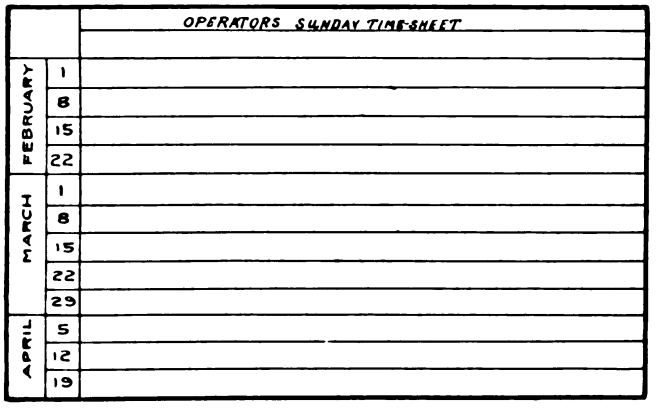

Fig. 2.

and from 2 P. M. to 4 P. M., and from 5 P. M. to 9 P. M. Operator No. 8 is on duty from 9 P. M. to 7 A. M.; that is, her time commences on the date of the time sheet and continues until 7 A. M. of the next day, but should be included in the previous day's time record.

Fig. 2 is a form for operator's Sunday time. For instance: Opposite the first Sunday in February should be placed the operators to work that day, say 1 and 2, then on the 8th operators 3 and 4 should be assigned, and so on for the 15th and 22d, if possible, so that if there are enough operators none of them have to work more than once a month on Sundays. To prevent having all old operators on at one time and new operators the next, it is a good idea to give the oldest operators odd numbers and the new operators even ones, so that when an operator drops out the place can be filled by the next higher, if it is an odd number, or by the lower number should the missing operator's number be even.

AN OPINION ON EXCHANGE ARRANGEMENT

EDITOR'S NOTE.—We insert the accompanying letter from a valued correspondent because we believe the topic to be one of general interest, and views from all standpoints are of value to our readers. There is, however, no such thing as a uniform standard in telephone office arrangement. In some places a single office is best adapted; in others, branch offices and trunking facilities must be provided; here a large and rapidly expanding toll business must be cared for; there, little such traffic is to be expected. Mr. Clausen's suggested arrangement is appropriate and sufficient to one set of conditions, Mr. Wilhelm's to another; both are good, for, like the Druid's Shield, the problem presents different aspects from different viewpoints, and no one standpoint can possibly include all.

RESPECTING an article which appeared in the AMERICAN TELEPHONE JOURNAL entitled "Model Exchange Arrangement," I would like to make a few remarks:

The floor plan of operating room, as shown in the cut, Fig. 1, is not in accordance with the most advanced practice. One of the most potent factors in determining the nature of the floor plan is the probable growth. Now with the toll boards lined at right angles to the main switchboard, as shown, the direction of their growth is necessarily at right angles to that of the main board. Any increase in the dimensions of the building to accommodate the one would be useless in accommodating the other. The ideal arrangement would be to line up the toll boards in the position now occupied by the last two sections, shown in dotted line, then the direction of their growth would be towards the rear of the room. If the main board increases to a point where it meets the toll board a new toll board must be lined up on another floor, and when it is completed the present toll board can be turned into main switchboard. However, by removing the partition around the present toll room, the length of the main operating room can be increased, so that the first section of main switchboard can be placed at the point now occupied by the first section of toll board. This arrangement would allow of a greater number of sections being accommodated on that side of the operating room, and consequently, allow of a greater growth before the line of toll boards was reached.

In the floor plan of the operating room there are no incoming trunk sections shown. I assume, however, that they are present. The growth of the subscriber boards and toll boards being independent, the present practice is to line the two up separately, bridging the subscriber and ring down trunk multiple at the intermediate frame, as shown at Fig. 2, where an elevation of the building is with the subscriber boards on the floor above that carrying the trunk boards. The cables are shown bridged at the intermediate frame. It is not absolutely necessary to resort to this device, however, except in the case of large offices where the growth is rapid. For an office of the size shown the best plan would be to locate the trunk positions at the first sections of switchboard, leaving two or three blank positions for growth. The positions marked "toll," I presume, are the incoming trunks from toll board. In view of the fact that there are only two toll sections, and therefore about 16 or 20 toll lines, I cannot conceive the necessity for so many of this type of trunk.

B. C. WILHELM.

TELEPHONE NEWS FROM PANAMA.

JAMES E. BRAILEY has returned from the Isthmus of Panama, where he went in the interest of the Brailey & Barber Telephone Construction Company. Mr. Brailey says that Central and South America has improved rapidly in the past few years and that such modern inventions as the telephone and telegraph have been introduced throughout the whole territory. He thinks there is a great field in the tropics for the investment of surplus American capital.

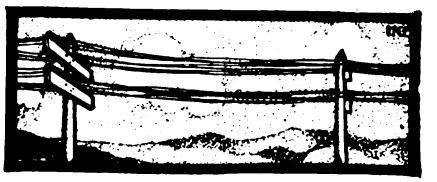
QUERIES

Questions on any subject relating to telephony will be answered on this page.



CABLE TESTING—(390).

What do you think about a direct-reading ohmmeter for locating trouble in a cable? Can it be done to advantage? If not, do you know of any other instrument that would answer the purpose and easy to operate and understand? G. W.

A direct-reading ohmmeter is an excellent instrument for all kinds of testing which may be required by a telephone exchange. A Wheatstone bridge is another instrument that can be used for the purpose. This is somewhat more accurate, but requires some skill in operating and consumes more time in making tests.

TOLL METER—(391).

Will you please illustrate the connection of the toll meter as used by the Bell Companies? J. C. W.

In Fig. 391 is illustrated the general connections employed. The meter *a* associated with the line, is tapped on to the third or sleeve connection, and is called the line meter. The meter *b* is common to all the cords of a position, and is termed the position meter. When a call is to be registered the button shown in the drawing is pressed. This places the position meter in series with an 8-volt battery in addition to the regular 24-volt battery, and also forms a shunt path around the supervisory lamp and associated resistances. The circuit is completed through the

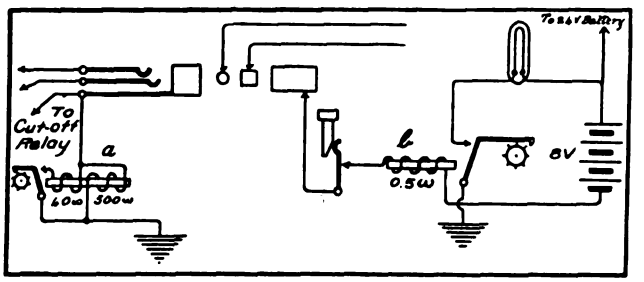


Fig. 391.

sleeve of the jack and through the 500-ohm winding of the meter relay. The relay armature is thus drawn up, and when it closes the circuit through the 40-ohm winding the relay *b* of the position meter is operated, closing the meter pilot lamp circuit and showing the operator that both meters have registered.

The reason that two windings are used on the line meter is that if for any reason there is a high resistance in the circuit it will not allow enough current to flow through to operate the relay by means of the 500-ohm winding, whereas if there was only one winding of a lower resistance enough current might flow to operate the line relay but not enough to operate the position meter.

PHANTOM—(392).

I have noticed that the word "phantom" is used in conjunction with two trunk circuits which are so connected as to give a third. I do not quite see the relation between the word and the use. P. G.

The word "phantom" means an illusion and is applied to telephone circuits where a new one is created by means of two others without in any way interfering with them. The term "phantom" is also applied to composite telephone and telegraph circuits because the operation of the telegraph circuit is not evidenced in the working of the telephone circuit.

MEASURING RESISTANCE WITH VOLTMETER—(393).

I have a voltmeter measuring 15 volts in half volts (coil measures 66 ohms), how can I determine the resistance of a line by the deflections? R. G.

To measure a resistance with a voltmeter it is necessary to know the resistance of the voltmeter. Let this resistance be called *r* and the resistance to be measured *R*. Place the voltmeter and a battery in series and note the deflection, which may be termed *D;* then place the battery, the voltmeter and the resistance to be measured in series, and note the deflection, which may be termed *d*. Then the following equation is true $R = \frac{r\,(D - d)}{d}$. Solving this equation will give the value of *R*. This method of testing is dealt with very fully under the heading of electrical measurements in the issue of March 7, 1903.

RELAY CIRCUIT—(394).

Is a relay in series or shunted on a telegraph circuit? K. S.

Usually the relay is in series on a telegraph circuit, though in some cases it may be put in shunt.

POLARITY OF INDUCED CURRENT—(395).

Does the induced pulsating current in a telephone coil go below the zero line as an alternating current does? K. S.

In the secondary or induced circuit of an induction coil the current is alternating and varies from both positive to negative values.

MAKING TRANSPOSITIONS—(396).

Will you describe the best method to be employed in making line transpositions? G. L. T.

The method generally used at present is shown in Fig. 396. To make this transposition cut the wires *A C* of such length as to enable them to be dead ended on their insulators, slip over each wire a McIntire sleeve and run it back about two feet, carry each wire to its insulator and dead end it with a half sleeve. Cut the

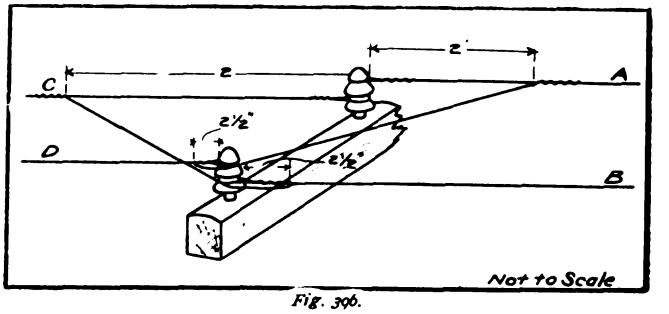

Fig. 396.

wires *B D* about 5 feet longer than is necessary to reach their insulators, carry each to its insulator, turn it around the insulator and dead end it with a half McIntire sleeve, then carry the slack over the wires *A* or *C*, introduce it in the McIntire joints previously specified and twist the same into a joint. By following these directions you should have no difficulty in cutting in the transposition correctly.

GROUNDED LINES IN A CABLE.—(397.)

We have been installing a telephone system and have been told by an agent not to put a few metallic circuit lines into a cable that has grounded circuits. What harm will it do? W. R.

The era of grounded lines is rapidly disappearing, and consequently a company which installs this form of plant is hardly living up to the Independent motto, "Good Service." Aside from this it is inadvisable to put grounded lines in a cable that is used for metallic circuits, since if each side of a pair were used for a separate grounded circuit, cross talk would be inevitable between the two lines and also to a greater or less extent between all the other pairs of the cable. It is best, as far as possible, to keep the grounded and metallic circuits entirely separate. If grounded wires are caused through the cable both wires of a pair should be used for a line.

CONDENSERS—(398).

Would condensers help the ringing on a grounded party line or hurt the talking and would all the instruments have to have them or would one work on a certain instrument and not affect the others? J. L.

The use of condensers in a telephone circuit is confined almost entirely to common battery operation or to some special form of selective signaling in conjunction with other apparatus. The object of the condenser when used in the bell circuit of a common battery instrument is to prevent the current flowing through the ringer coils and thus operating the signal. In magneto work there is no need for its use, since the only battery there is, is in the local circuit controlled by the hook switch. If you would let us have a better idea of what you have in mind we will be pleased to answer at greater length.

AN INSPIRED NEWSPAPER REPORT.

THE following account of a "telephone war" to be waged against all Independent companies by the American Bell Telephone Company is taken from a newspaper exchange: "The trust, known as the Bell Telephone Company, has inaugurated one of the greatest financial conflicts in the world. It is determined to rule or ruin every Independent line that is trying to exist in opposition to it. The Independents themselves, growing bolder because of their success against the trust, caused the attack. They began organizing to resist any attempt of the Bell company to crush them, and the Bell people determined to strike the blow before the organization of the Independent companies in Indiana, Illinois, Michigan and Ohio could be completed. The recent removal of the Chicago offices of the Bell company to Indianapolis was regarded with suspicion by the Independents. Recent reports lead them now to believe that the Bell company wished to have its headquarters nearer the scene of its conflict with the Indiana Independent telephone companies."

This somewhat remarkable announcement, which doubtless in its original form came from some inspired source, has appeared in one shape or another in various parts of the country in accord with the well-known Bell methods of influencing public opinion through the newspapers. It is difficult to understand just what ideas the newspaper fraternity have regarding the telephone situation in the United States. The average editor unless his investigations have brought him in direct contact with the Independent telephone movement is a little hazy in his views regarding Independent telephony.

He is familiar with the Bell company in all its ramifications, for the Bell interests have been wise in their appreciation of the power of printer's ink; but often he displays very little knowledge of that great wave of revolt against Bell monopoly, which, starting in the Middle West ten years ago, has been sweeping steadily and irresistibly across the country in every direction. One would think from reading news and comments of the character quoted, circulated originally in order to affect Independent securities and discourage Independent competition, that all the Bell "octopus" has to do is to reach forth its giant tentacles and lay hold of the territory coveted.

The newspapers referred to do not seem to realize that the tentacles have in a measure lost their grip; that, while the American Bell Telephone Company is still a powerful corporation and has some strength left in the West, this strength is largely in its long-distance service. Strip the Bell of its long-distance possibilities, or, what amounts to the same thing, give the Independents equal long-distance facilities, and the old monopoly could not begin to hold its own. This latter is what is being done. The time is now not far distant when the Independents will be able to offer the public long-distance connections on an equal footing in this respect also.

It would be well for the Independents to learn something from their friends the enemy, and pay more attention to the publicity end of the business. That the public should always maintain the correct attitude toward Independent telephony is important. The public at large has only one means of getting information on such matters. The newspaper press is the go-between. All doors swing open to the newspaper, and homes which zealously exclude all evil companions welcome the daily sheet, though burdened with evil communications. The readers of a periodical like the AMERICAN TELEPHONE JOURNAL are necessarily limited to those who are in some way interested in the telephone business. This journal can reach the great reading public only indirectly. The Bell people have figured on this in planning their newspaper campaigns in the past, and it is reasonable to suppose that similar methods will obtain in the future.

AN OBJECT LESSON IN PUBLICITY.

It would, no doubt, be a surprise to many usually well-informed newspapers to know that in this rich territory of the Central West, where beats the great heart of the nation, the number of Independent telephones in service far exceeds that of the Bell, and that they greatly surpass the Bell in service.

Probably the Bell company has some defined line of attack in view which gave rise to the newspaper squib referred to. Its recent success in borrowing twenty million dollars, on top of other indebtedness, although indicating an unfortunate financial condition, shows that the trust has not lost all of its teeth, and that there is "something doing." Stated with a proper regard for truth, the plan is probably like this: "We must make a great struggle in this Western territory, not so much to get back what we have lost as to keep ourselves from being driven from the field entirely by these unspeakable Independents." In other words, the horse has been stolen; the barn will now be locked so that the carriage may not be taken also.

There was a time when the field could have been closed against Independent competition, and there was a way in which Independents could have been shut out. The trouble is that the necessity was not apparent until it was too late. That way will not always prevent a healthful competition; but in the case of the telephone monopoly it would have been very effective. The plan referred to is very simple, merely to make competition unnecessary. If the Bell people had studied how to give the best service for the least money, instead of how to give the least service for the most money, they would not now be borrowing millions in order to put their exchanges on a competitive basis and save the remainder of their business from a vigorous and growing rival.

There was a time when all this could have been done; but it is now everlastingly too late. The Bell company is still a power. With its great financial resources and its centralized authority it can accomplish much if it really has awakened to the needs of the situation. But it can no more stay the progress of Independent telephony than the sea can be swept back with a broom.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

COMPELLING GRANT OF FRANCHISE.

I have known of some cases where the councils would not grant the permit of franchise to local companies and they have taken the matter to the courts and there received same or the courts have ordered the council to grant same. My attorney wants to know if any of these cases or decisions have been from the United States Courts, or just from the State courts. We may be up against the same thing in this section, and if so desire to know where to look for the authority for such law, as he says the law in this State gives the whole power to the Selectmen. Can you give me any light on the subject and tell my attorney where to look for the law. H. C. H.

THE following are cases of the kind you ask about: Norwalk & South Norwalk Electric Light Co. v. Common Council (Conn.), 42 A. 82; State ex rel. Bell Telephone Co. v. Flad, 23 Mo. App. 185, 2 Am. Elec. Cas. 128. I know of no United States cases. Your attorney is undoubtedly right in his opinion. It is only where the duty of granting a franchise or license is imposed on the council and no discretion given the aldermen or selectmen that they can be compelled by the courts to act. State ex rel. Home Telephone Co. v. Common Council (N. J.), 40 A. 628.

HOW CAREFUL MUST COMPANY BE?

SOME employees of the Cumberland Telephone & Telegraph Company were stretching wires along a turnpike road in Kentucky and at the same time a man was driving a two-horse wagon along the same pike. One of the poles of the company broke about seven or eight feet from the ground, under the tension of the wires, and was thrown into the highway, striking the man who was driving upon the head and knocking him off the seat of his wagon and into the highway. For the injury thus received the man sued the company. On the trial the circuit judge instructed the jury that the care required of the company was ordinary care, which he defined as "that degree of care usually exercised by ordinarily prudent and skilful men." The company alleged as error the use of the word 'skilful' and appealed to the Supreme Court. The court held the use of the word not to be erroneous, saying: "The business of operating a franchise along a highway by means of agencies which may endanger the lives or limbs of the traveling public necessarily requires a certain amount of skill, as well as prudence, in carrying forward the business in hand. One may be prudent without being skilful, or skilful without being prudent. It would appear that the operation of a franchise, such as the one under consideration, with due regard to the safety of the public, requires at least an ordinary amount of prudence and skill; and, while the addition of the word "skilful" may be unusual, we are inclined to believe that it is technically correct." Cumberland Telephone & Telegraph Co. v. Warner (Ky.), 79 N. W., 199.

TELEPHONE CONVERSATIONS AS EVIDENCE.

IN a suit to recover a balance alleged to be due to the plaintiff from the defendant for services rendered in securing a customer for an express business in Salem, the Supreme Court of Massachusetts declared what the rule should be as to receiving telephone conversation in evidence. The only question in the case was whether a witness was properly allowed to testify to what he heard the plaintiff say as part of an alleged conversation with the defendant over the telephone, the plaintiff being in Boston and the defendant in Chelsea, and the witness being in the presence and hearing of the plaintiff. The witness had not personal knowledge with whom the plaintiff was talking, did not hear anything that was alleged to have been said by the defendant, and did not know that the defendant heard anything that the plaintiff said; the plaintiff testified that the conversation was with the defendant.

The court held that the evidence was rightly admitted. Said the court, "the evidence that was admitted cannot be regarded as hearsay evidence or declarations made by the plaintiff in his own interest, simply because the witness did not know, of his own knowledge, that the other party of the conversation, was the defendant, or that there was any other party, or that the defendant heard what was purported to be said to him. If the alleged conversation took place as the plaintiff testified that it did, then what the plaintiff said was admissible as a part of it. Whether it did take place as alleged, or was fictitious, was a question of fact for the jury. It could not be ruled, as matter of law, that there was no evidence of a conversation between the plaintiff and defendant of which what was testified to by the witness constituted a part. McCarthy vs. Peach (Mass.), 70 N. E. 1029.

WIRES FALLING IN STREET.

IT is the duty of a telephone company to use ordinary care to keep its poles and wires in repair, and, if they fall to the street, to prevent them from remaining therein to the interruption of traffic. Tennie Pharis recovered judgment against the West Kentucky Telephone Company and the city of Mayfield for $250 each as damages for injuries received from tripping over one of the telephone company's wires in the street. The wire was attached to two poles of the company that fell during a heavy and destructive storm of sleet in 1902. The principal defense was that plaintiff admitted in her testimony that she had previously seen the fallen wire and should therefore be presumed to have known of its presence at the time of the accident and the necessity of avoiding contact with it. She testified, however, that she had forgotten about it and had her mind intent on the sickness of a sister she had just come from attending. The court held that, having forgotten the defect, plaintiff was not guilty of contributory negligence. West Ky. Telephone Co. v. Pharis (Ky.), 78 S. W., 917.

DAMAGES FOR TRESPASS.

E. T. WHITEMAN, of Dallas County, Texas, sued the Southwestern Telegraph and Telephone Company to recover damages for trespassing upon his premises. He alleged that the company, by its employees, entered his private yard, erected a telephone pole and strung wires thereon, which were dangerous to the life, limb, and security of the occupants of his house by reason of their close proximity thereto; that his premises would be subject to constant invasions for the purpose of mending and repairing the wires; and that the placing and wiring of the pole materially decreased the value of his property. He asked $600 actual and $400 exemplary damages. Before the trial he amended his declaration, alleging that the pole had been removed from his premises by the company and a large hole left where the former pole stood; that he had employed lawyers to institute suit, and that he had lost time which he placed at $5.20 per day in trying to get the company to remove the pole. He was given judgment for $135.

On trial he was permitted to answer the question, "what would have been the depreciation in value of the land if the pole was now there?" and answered, "all the way from $300 to $700." This testimony the court of civil appeals of Texas held inadmissible because the pole had been removed at the time of the trial. It further held that the plaintiff could not recover for his lost time in trying to get the company to remove the pole, because it was not the natural and probable result of the trespass. The plaintiff was not entitled to recover on the allegation that the pole was placed dangerously near the house because it had been removed without damage. The court also decided that no exemplary damages should be allowed. Judgment was reversed. Southwestern Teleg. & Tel. Co., vs. Whiteman, (Tex.), 81 S. W. 76.

IN THE OPERATING FIELD.

IMPORTANT OHIO PRECEDENT ESTABLISHED.

THE city solicitor of Cleveland has made use of the decision of the State Supreme Court in the Toledo telephone case to settle a dispute of long standing between the City of Cleveland and the Cuyahoga Telephone Company. In brief the Supreme Court's decision in the Toledo case was that the municipality has no right to regulate telephone rates.

Some six months ago the Cuyahoga Telephone Company readjusted its schedule of rates, making some of them slightly higher than they had been before. The city coucil of Cleveland took the matter up, claiming that under the terms of its franchise the company had no right to make such a readjustment. The dispute between the council and the company became somewhat heated, and the council proposed to cut the company off from the privilege of erecting poles or laying cables in the streets.

Now, under the Toledo decision, the city solicitor holds that the council has nothing to say regarding the readjustment of rates and that, moreover, it is powerless to prevent the erection of poles or such other improvements as the company may desire to make, as long as it keeps within the ordinances of general application.

IMPROVEMENTS OF UNITED STATES COMPANY.

JUST as soon as arrangements can be made for starting the work, the United States Telephone Company will begin the expenditure of $450,000 to better its service throughout Ohio and adjoining States. The recent announcement of a loan for the amount named above has attracted much attention among telephone people and it is predicted that its effect on the United States Company's system will be even more far reaching than had been thought.

The plans call for the running of a large number of new lines on the poles already placed. As comparatively few poles will be set, the larger part of the amount secured for the improvement of the system will go to increase the available wire mileage. It is estimated that almost 9,000 miles of lines will be strung by the time the plans are carried out. It is calculated that this will increase the earning power of the company by one-half. Together with the announcement of the securing of the large sum for long-distance improvements came that of the reduction of the debt of the Federal Telephone Company by $600,000. These two moves are considered by telephone men to have been the most significant in Ohio Independent fields for many years.

THE WESTON EMPLOYEES' CLUB.

AN experiment in social economics which has attracted the attention of the Bureau of Statistics in New Jersey is that of the Weston Electrical Instrument Company, at Newark, in that State. In this period of generally strained relations between capital and labor, it is pleasant and unusual to find a plant whose owners are carefully endeavoring to draw together, rather than sunder, the relations between themselves and their employees. The "Weston Employees' Club," which is now about a year old, is the outcome of an idea often revolved by the president of the concern, Professor Edward Weston. Briefly, Mr. Weston's plan has been to give his employees a live interest in their business by showing that, on its part, the company for which they work had a live interest in them. A club-house, being a part of the operating plant, was made over to the employees; the latter then organized the association referred to. The club is now entirely free from company paternalism.

Recreation rooms, library, kitchen, dining room, gymnasium, swimming pool, bicycle racks and hospital have been established in the association's commodious quarters. The sanitary and other appliances are of the highest type, such as are to be found in the buildings of first-class clubs and hotels in large cities. The result of this experiment has been that the attachment of the employees to the Weston Company is very highly developed. Each man expects his connection with the corporation to be for life and looks upon his future progress as bound up with that of the company, of which he is a part. A little pamphlet recently prepared for the Louisiana Purchase Exposition gives a full account of this unique experiment and to it we would refer our readers for fuller information.

THE BELL OUTGENERALED.

THE appointment of receivers by Judge Audenried, of Philadelphia, for the Standard Telephone and Telegraph Company, of Pennsylvania, marks the defeat of the Bell corporation in its endeavors to get control of the concern. The appointment of Mr. I. D. Ginhart, auditor of the Keystone Telephone Company, as one of the receivers is a distinct victory for the Philadelphia Independents and presages the passing of control to the Keystone people. There is only one other receiver—T. O. Atkinson, treasurer of the Bucks County Trust Company.

The Standard Company has a capitalization of $100,000, and is the possessor of valuable franchises in Bucks County, Pa., and in New Jersey.

The application for receivers was made by John A. Roebling's Sons Company, wire manufacturers, Trenton, N. J. Other claims amounted to $18,000. The value of the system is estimated at $150,000. Judge Audenried required the receivers to enter security for $50,000, and empowered them to continue the business.

LONG DISTANCE CONNECTIONS FOR HOME COMPANY, OF LOUISVILLE.

WITHIN a week the Home Company, of Louisville, Ky., will have a line in to Kansas City, and this will be followed by immediate connections between Louisville and Topeka, Kan. A line is also in process of construction between Richmond, Ind., and Dayton, Ohio, which will give the Home telephone a line into Pittsburg. With the completion of this forty miles of telephone line, which will be ready for service in about thirty days, the Home company expects to be able to secure a little later a line into Philadelphia and Baltimore. This will be accomplished by an amalgamation of interests with the United Telephone and Telegraph Company of New York State and Pennsylvania, whose lines radiate from Harrisburg, Pa.

NEW SYSTEM FOR HOPKINSVILLE, KY.

THE Ideal Construction Company, of Lima, Ohio, has added another successful plant to the rapidly growing number which it has been called upon to install. This latest addition is the system of the Hopkinsville Home Telephone Company, of Hopkinsville, Ky. Hopkinsville has had a telephone service (?) supplied by the Cumberland Company for a number of years, but the people had realized for a long while that if there was to be any relief from the excessive charges and the poor service given that they would have to secure a system of their own. So after serious consideration the contract was let to the Ideal Company. Under the able direction of Arthur W. Hoge, president and treasurer, and Gustav Hirsch, vice-president and general manager of the Ideal Construction Company, rapid strides were made in the installation of the system towards its completion which took place recently. The officers of the Home Company are R. E. Cooper, president; G. H. Metheaney, vice-president; J. F. Garnett, treas-

Digitized by Google

urer; F. G. Hoge, secretary, and J. T. Edmunds, general counsel, together with the directors: E. M. Flack, Hon. W. T. Fowler and J. Russell.

The Home Company is to be congratulated upon the method in which the project was carried through and also for the assistance given by the Ideal Construction Company, which is recognized as being one of the best organized and best equipped construction companies in the United States.

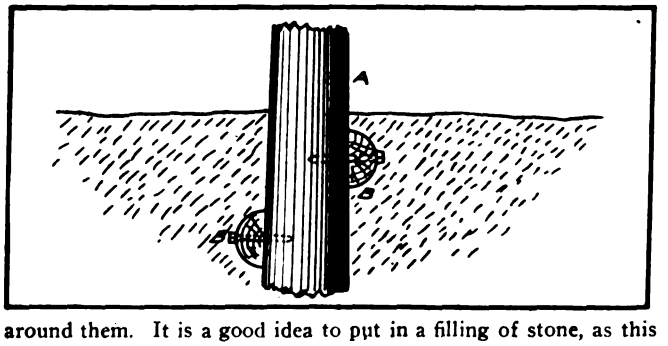
INDEPENDENT SYSTEM FOR EAST DUBUQUE.

THE Tri-State Telephone Company is perfecting plans for the construction of a sub-marine cable for the extension of the line to East Dubuque. The work of building the cable has already been commenced at a Chicago factory and it will be completed next week. It will require 2,375 feet of sub-marine cable to span the river, besides 3,600 fett of aerial cable, which will be run from the river's banks to where the wires spread out in Dubuque and East Dubuque.

AN UNDERGROUND POLE BRACE.

IN localities where it is not possible to place a guy wire for a pole support, the method illustrated in the accompanying figure is generally employed.

Two logs, *B B*, about five feet long, are shaped as illustrated and then bolted to the pole; the earth is then thoroughly tamped



around them. It is a good idea to put in a filling of stone, as this will enable the logs to be more firmly secured. In marshy ground this method of construction could be employed with a large measure of success.

When the logs are used in place of guy wires they should be placed as nearly at right angles to the direction of strain as possible, to secure the best results.

ANOTHER CASE OF BELL METHODS.

MAXTON, N. C., is having the usual trouble with the Bell Company. It appears that until about three years ago the telephone service was furnished by a local company, organized in 1898. The concern gave general satisfaction and netted handsome dividends for its owners. It was then bought out by the Carolina Telephone and Telegraph Company, which showed the usual signs of being conducted in the Bell interests. The new owners allowed the service to go down hill steadily, made no repairs on the line and neglected the maintenance department. Of late months, the service had become so poor that a continual string of protests had been registered at the office. The Carolina Company now informs its unfortunate subscribers that the corporation is preparing to improve the service by entering into relations with the Bell system and by doubling its rates. An indignation meeting was held a few days ago and there is great interest in Maxton and its vicinity as to what the result will be.

A PROSPEROUS PENNSYLVANIA COMPANY.

THE first annual meeting of the Union Telephone Company, which operates in the town of California, in Washington County, Pennsylvania, was held recently. The report of the directors for the year showed that the operating accounts after paying two dividends amounted to $563.75, a balance of $230. Besides the balance in cash there is about $1,000 worth of material and construction tools on hand, showing that the construction work has been very carefully and economically carried out. The matter of another increase in the capital stock was discussed and the advantages of still further extending the company's business was recognized. Additional lines will be built to accommodate the increasing demand for service and toll line connections will be established to Pittsburg and other points in Pennsylvania, and also with Ohio and West Virginia.

The Union Telephone Company has achieved exceptionally good results for the short time it has been in business and it is evident that the people in the vicinity appreciate the value of an Independent system. It now has 225 subscribers and the construction force is kept busy adding new lines to accommodate the large number of parties on the waiting list. The company is capitalized for $15,000, of which $12,590 has been subscribed for.

INDEPENDENT MEETING AT COLUMBUS.

THE executive committee of the Ohio Association of Independent Telephone Companies has divided the State into nine districts for organization and mutual working conditions. There will be a meeting of the vice-presidents of the association at Columbus, Ohio, on August 8. Plans will then be laid for a thorough organization of the Independent telephone companies of the State.

SECOND DISTRIBUTION OF PROFITS TO CUYAHOGA EMPLOYEES.

DURING the last week the employees of the Cuyahoga Telephone Company at Cleveland received their portion from the profit sharing plan which the company voluntarily established about a year ago. This distribution was for the first half of the present year and amounted to 6 per cent. of the total salary received by each employee for that period. There had been much computation among the employees as to what their shares would amount to and much satisfaction was expressed as they were more than had been anticipated. The distribution covered all classes of employees and meant the turning over by the company of several thousands of dollars. Probably the operators fared the best of any class, as within the past six months they received an advance of 25 per cent. in their salaries, and this addition was figured in with their totals.

This is the second distribution under the profit sharing plan, which was established a year ago by President Dickson and given a six months' trial by way of experiment. It proved to be so satisfactory to all concerned that in his annual report to the directors and stockholders, President Dickson recommended that it be continued. On his recommendation it was decided to make it a permanent business feature of the company.

AN INDEPENDENT L. D. DIRECTORY.

THE National Telephone Company, of Wheeling, W. Va., is at present distributing its first long distance telephone book to subscribers and it contains all the features that have so far characterized its directory of subscribers, principal among which are the classified lists in the back. The book is much greater in size than its previous issues and shows a substantial increase in business, while a feature that is announced throughout it is that every telephone is privileged to long distance service. It has almost complete service to the towns of West Virginia, Eastern Ohio, and Western Pennsylvania, while it announces that in a short time its service will be extended to a far greater radius, ultimately covering practically all of Ohio, Pennsylvania and West Virginia within the next thirty days.

FEDERAL COMPANY'S FINANCES.

THE Federal Telephone Company has taken up Reserve Construction Company notes amounting to about $630,000, with United States Telephone Company bonds. This reduces the outstanding obligation of the Federal Telephone Company to $900,000. Two years ago this was $4,000,000. The report caused a strengthening of the stock on the Cleveland Stock Exchange.

The statements of the company's earnings for June show a small deficit in one of its subsidiary companies and a good surplus in the remainder.

TELEPHONE PATENTS

INDUCTANCE COILS FOR LOADED LINES.

M. I. Pupin, of New York, patents (No. 761,995) and assigns to the American Bell Telephone Company, of Boston, Mass, the method of making induction coils for loaded lines. In this patent Dr. Pupin describes the method for manufacturing inductance coils to be used in series with telephone lines for the purpose of reducing the attenuation which is so destructive to successful long-distance telephony. The method of winding and connecting the coils, which Dr. Pupin describes, is shown in the accompanying illustrations in Figs. 1 to 5, inclusive. In the course of the patent Dr. Pupin specifies three conditions. The first condition is that the coil should be as small as possible, which he recommends to be accomplished by distributing the windings of the coil over the core and by arranging the coils in such a manner that the same core contains the windings for both the outgoing and incoming conductors. The second condition requires that the insertion of inductance coils should not disturb the electrical distribution of the current wave. This is to be accomplished by making both windings of the same inductance and same resistance and winding them symmetrically in respect to the core. The third condition requires that there should be no mutual inductance between neighboring coils belonging to different circuits. The illustrations in Figs. 1, 2 and 3 are sufficiently self-evident of the method adopted by Dr. Pupin to require no further explanation. The first two claims in the patents are as follows:

Fig. 1.

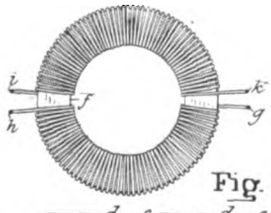

Fig. 2.

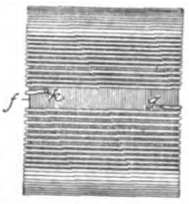

Fig. 3.

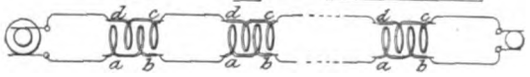

Fig. 4

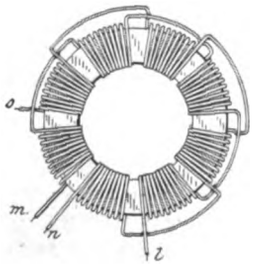

Fig. 5.

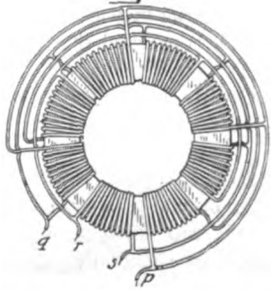


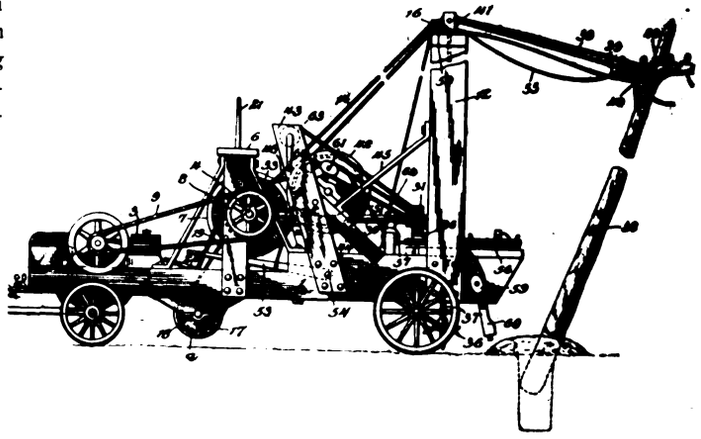
1. An inductance coil having an iron core, forming a closed magnetic circuit, in which the resistance due to hysteresis is smaller than the resistance due to Foucault currents for current strengths and for the highest important frequencies (about 1,500 p. p. s.) in telegraphy or telephony, substantially as described.

2. An inductance coil having an iron core, forming a closed magnetic circuit, in which the resistance due to iron core losses of energy is smaller than five times the true ohmic resistance of the winding of the coil for all telephonic frequencies up to 1,500 p. p. s., and for current strengths of importance in telegraphy or telephony, substantially as described.

A slight consideration of these claims indicates that Dr. Pupin has taken out a patent for a condition, and not for the means of securing that condition. In other words, this patent closely resembles the famous Bell patent of 1876, which was construed by the courts to cover the *undulatory transmission of speech*, and if the present patent should be treated with the same liberality, it could be held to cover all forms of inductance coils which produce a certain result, irrespective of the method employed in their manufacture. It is to be hoped that when the inevitable contest arrives the courts will exercise the same good sense and discrimination that has recently appeared, and will not hold that this patent is one of those much-to-be-deplored grants which places inordinate power in the hands of a single inventor, or the corporation to whom he assigns his patent.

APPARATUS FOR ERECTING TELEPHONE POLES.

William Parker, of Tecumseh, Neb., patents (No. 762,490) an improved apparatus for erection of telephone line poles. The invention is shown in the side elevation in the accompanying illustration, which has for its object the provision of an apparatus



whereby a motor can be mounted upon a proper car and said motor can be employed to drill a hole in the ground, into which the pole may be planted and also to arrange a derrick whereby the pole may be easily handled and planted. The general features of the invention are sufficiently indicated by the drawing to warrant a further description unnecessary.

AUTOMATIC LIGHT SWITCH FOR TELEPHONE BOOTHS.

J. L. Bolan, of South Connellsville, Pa., patents (No. 764,792). The object of this invention is to provide an electric switch for illuminating a telephone booth. The inventor accomplishes this by supplying the armature of the ringer with a kind of a trigger, so that when the telephone in the booth is called the ringer magnet is actuated, the trigger set free, closing a switch to turn on the electric light.

MESSAGE COUNTER.

E. H. Smythe, of Freeport, Ill., patents (No. 764,690), and F. R. McBerty, of Evanston, Ill., patents (No. 764,752) and assign to the Western Electric Company, of Chicago, Ill. The object of these patents is to provide a switchboard circuit to be used in conjunction with a message counter located at the subscriber's substation so arranged that the chief operator or supervisor shall be notified in case the operator does not properly record the message. As both these patents are essentially the same they will be construed in one description. The subscriber's substation is shown provided with a counting device, which consists of a slot to receive the coin-containing contacts so that the definition of the coin shall complete the circuit and enable the subscriber to signal the exchange. There is a polarized magnet, c', that actuates a lever, c^4. If the operator sends positive current, for example, over the line, the lever c^4 will cause the coin to be deposited

Digitized by Google

in the cash box, c^2, while, if the operator sends negative current, the coin will be delivered to a chute and returned to the subscriber. Referring to Fig. 1, which is the drawing accompanying patent No. 764,752, it will be seen that the operator's cord circuit is equipped with the double key *k k'*. The office of this key is to

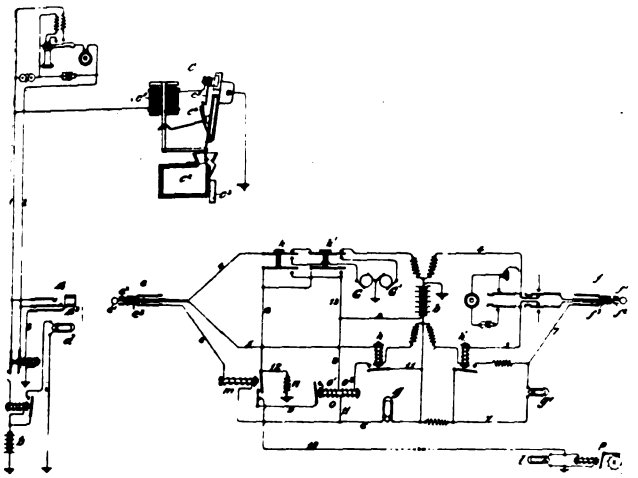


Fig. 1. Patent No. 764,752.

enable the operator to send the proper polarity of current to the subscriber's station to actuate the coin-controlling device. The operation of this system is as follows:

When the answering plug *e* is inserted in the spring-jack *a* the local circuit *6 3* is completed, and the telephone at the substation being off the hook the circuit of the battery *b* through the link conductors *4 5* and over the telephone line will also be completed, so that the supervisory relay *h* will be excited to close the shunt *11*, which contains the winding o^2 of magnet *o*. Relay *m* should operate a moment before relay *o*, and the spring jack

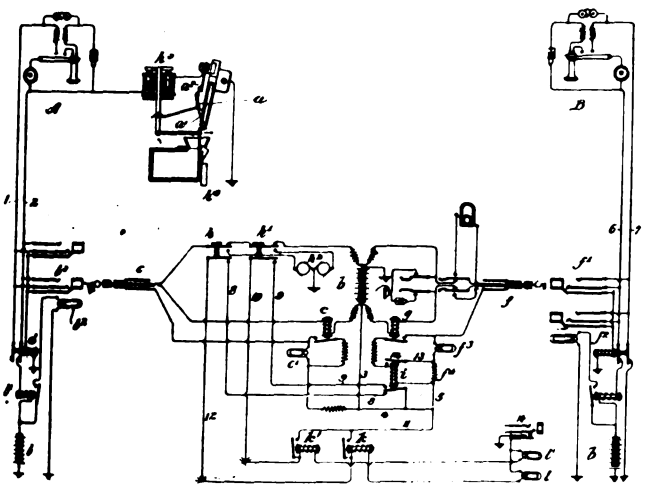

Fig. 2. Patent No. 764,690.

and plug are so constructed that the contacts e^3 a^3 will come together to close the circuit *6 3* before the ring contact e^2 of the plug strikes the longer spring of the jack to complete the circuit of conductor *5*. Relay *o* being excited will close its contact and establish the local circuit *8, 9, 12*, so that said relay will remain excited independently of current in the shunt *11*. If now the operator should withdraw the plug *e* from the spring jack without having actuated one of the keys *k k'*, the relay *m* on being de-energized would complete the connection between the conductors *9, 10* before breaking the connection of the ground conductor *12*. The signal lamp *l* and counting device *p* would thus be actuated and the chief operator informed that the connecting operator had failed to actuate her toll keys. The counting device and signal may be made common to all the plug circuits of one operator, so that a record of her omissions may be kept. After the subscriber has hung up his telephone the operator, before withdrawing the plug, must depress one or the other of the keys *k k'* to actuate the toll device, and in so doing the short circuit *13* around the winding *o'* will be completed, so that the relay *o* will be deprived of current and its armature will fall back, breaking the connection between conductors *8* and *9* and preventing the operation of the signal and counter.

SELECTIVE SIGNALLING SYSTEM.

T. C. Drake, of Malta, Ohio, patents (No. 763,970) a selective signalling system. This is an improvement in the ordinary four party line pulsating selective signalling system, and is illustrated in the accompanying drawing, from which it will be seen that the lead from the generator runs to the center of the battery *y*. This battery is so arranged as to be positive on one side of the line and negative on the other. Therefore, if the positive side of the generator is applied to the same side of the line as the negative battery the battery will reinforce the positive and weaken the negative waves

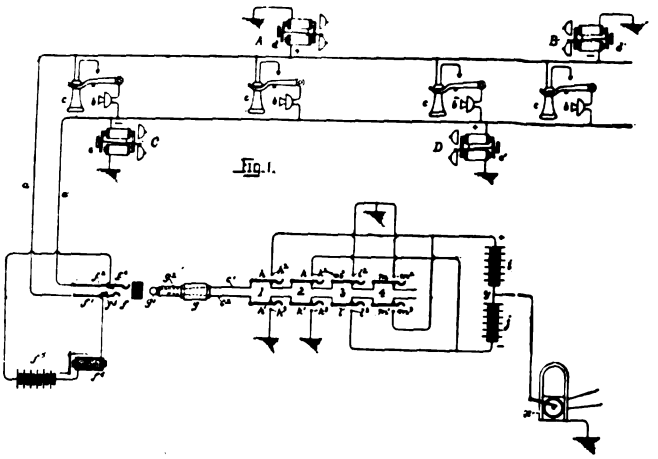

Fig. 1.

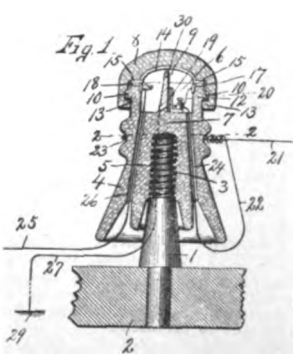
and conversely if applied to the other side of the line in the ordinary pulsating party line with biased bells, the bells are made selective by the operation of the spring which causes the bell to be non-responsive to currents in one direction. Now, it is evident that the combination of battery and generator thus shown, accomplishes about the same results by intensifying one side of the generator waves and weakening the other. Thus it is possible to do away with the biased spring and secure the same results simply by the weight of the clapper and armature, which is sufficient if the bells are placed horizontally as indicated, and the bell is much more sensitive and not likely to get out of adjustment.

COMBINED INSULATOR AND FUSE BOX.

A. Bearse, of Syracuse, N. Y., patents (No. 761,814) a combined insulator and fuse box. This invention is shown in the accompanying illustration, from which it appears that *1* is a pin which supports an insulating cap *7*. It is cone-shaped, and upon it the insulator proper *4* is placed. The top of the core *7* is arranged



to carry a heat coil and fuse, ground connection being obtained by means of the wire *27*, as is shown, while connection to the line wire is obtained by the wire *22*. Over the top of the shell *4* an insulating cap *8* is arranged to be secured either by a bayonet joint or a screw. The operation of this device is sufficiently shown by the illustration.

THE WEEK'S MESSAGES

FINANCIAL.

SAN FRANCISCO, CAL.—The Automatic Direct Line Telephone Company, of San Francisco, of which some prominent business men of this city are stockholders, has reorganized under the name of the Direct Line Telephone Company and has raised the capital stock from its former figures of $250,000 to $1,000,000.

DENISON, IOWA.—The Stockholders of the Crawford County Telephone Company have declared a dividend of ten per cent per annum. After the meeting was over $10,000 worth of additional stock was sold. The principal stockholders are citizens of Denison and Charter Oak and farmers of Crawford County.

MITCHELLVILLE, IOWA.—The Mitchellville Telephone Company has increased its capital stock from $10,000 to $25,000.

ALBANY, N. Y.—The Suffolk County Telephone Company has certified to the Secretary of State that its capitalization has been increased from $3,500 to $13,500. The certificate is signed by Walter H. Joycox, R. C. Greene, J. T. Lovee, Daniel Chichester and M. F. Tiger.

CANANDAIGUA, N. Y.—The Seneca-Gorham Telephone Company has increased its capital stock from $10,000 to $30,000. The lines are to be extended to Bellona.

CANASTOTA, N. Y.—The Farmers' Telephone Company will increase its capital stock from $1,000 to at least $10,000.

FRANKFORT, KY.—The Oldham Telephone Company has increased its capital stock from $10,000 to $20,000.

OSWEGO, N. Y.—At the semi-annual meeting of the directors of the Ontario Telephone Company the regular three per cent. annual dividend was declared.

SOUTHAMPTON, N. Y.—The Suffolk County Telephone Company has increased its capital stock from $3,500 to $13,500.

MOUNT PLEASANT, OHIO.—The Mount Pleasant Telephone Company has increased its capital stock from $5,000 to $10,000. Michael Gallagher is the president of the company.

YOUNGSTOWN, OHIO.—The Youngstown Telephone Company has increased its capital stock from $200,000 to $400,000.

PHILADELPHIA, PA.—It is reported that the Maryland Telegraph and Telephone Company will issue $6,000,000 bonds, of which $2,000,000 will be used to build an electric light and power house, and the balance to retire the first mortgage bond and exchange for the general mortgage bonds.

FRANCHISES.

GREENVILLE, ALA.—A franchise has been granted to J. C. Watson, of Georgiana, who will install a local telephone system.

SAN BERNARDINO, CAL.—F. B. Daley, representing the Arizona, Nevada & Southern Telephone Company, of Needles and Kingman, has applied to the county supervisor for a franchise to construct a line from Needles to San Bernardino. It is the intention of the company to build to every mining camp of consequence and extend into Nevada and Arizona.

ALTON, ILL.—The Fosterburg-Upper Alton & Main Line Telephone and Telegraph Company was granted a franchise to build a telephone line into the village.

CENTRALIA, ILL.—An ordinance has been passed granting a twenty-year franchise to C. D. Morey, G. E. Eis, Robt. Rohl, Hugo Prill and A. Harding to operate a telephone system.

DUBUQUE, IOWA.—The Interstate Telephone Company, of this place, has presented a petition to the city council of Omaha asking that it be granted a franchise to operate a telephone system in that city.

GALENA, KAN.—The Galena Home Telephone Company has secured a franchise in this city and will begin construction at once. The capital stock of the company is $10,000.

BELLAIRE, OHIO.—The Ohio Valley Telephone Company, which recently purchased the local telephone system, has applied to the city council, through Attorney J. C. Heinmein, of Bridgeport, for a new franchise. He stated that if the franchise was granted that a new exchange building would be erected, new lines built, and from $65,000 to $75,000 expended on improvements.

READING, PA.—The Consolidated Telephone Company, of Reading, has been granted a franchise to construct a system at Mauch Chunk.

ELECTIONS.

SAVANNAH, GA.—At the annual meeting of the stockholders of the Georgia Telephone and Telegraph Company the following officers were elected: W. A. Bisbee, president and general manager; J. H. Estill, vice-president; C. S. Kenyon, treasurer, and W. V. Davis, secretary.

CONCORDIA, KAN.—The Northern Kansas Telephone Association held its annual meeting and elected the following officers: J. M. Doyle, Belleville, president; C. W. Baldwin, Osborne, vice-president; G. G. Hill, Concordia, treasurer, and D. C. Tyler, Clifton, secretary.

BALTIMORE, MD.—At a meeting of the directors of the Maryland Telephone and Telegraph Company the following officers were elected: David E. Evans, president; H. W. Webb, vice-president and general manager; Stanley Baker, assistant to president.

MUSKEGON, MICH.—At the recent annual meeting of the Muskegon Citizens' Telephone Company the following officers were elected: President, Thomas Hume; vice-president, B. D. King; treasurer, L. B. Smith; secretary, W. H. Mann; manager, William Robinson. The board of directors consists of Thomas Hume, Thomas Monroe, Dr. D. B. King, J. G. Emery, Jr., C. H. Hills, L. B. Smith and E. B. Fisher. A semi-annual dividend of four per cent., payable July 20, was declared.

PATERSON, N. J.—At the annual meeting of the Paterson, Passaic & Suburban Telephone Company the following officers were elected: Charles W. Kline, president; George A. Post, vice-president; James W. Lindsay, secretary, and Barker Gummere, Jr., treasurer. Many improvements are being contemplated.

COLUMBIA, PA.—The Columbia Telephone Company has elected the following officers: H. C. Young, Dr. S. S. Mann, Charles E. Taylor, H. M. Hall, C. E. Lenig, S. W. Hinkle and C. S. Oberlin.

URBAN, PA.—At a meeting of the stockholders of the Citizens' Telephone and Telegraph Company E. R. Reitz was chosen president. The capital stock of the company will probably be fixed at $15,000 or $20,000.

COMBINATIONS.

BEDFORD, IND.—The Bedford Home Telephone Company has purchased the Bryantsville line and is now ready to give patrons service from the home exchange.

BATAVIA, N. Y.—All the telephone companies operating in the ten villages of Ontario County are taking steps toward a consolidation of interests. Collectively they have over 1,300 subscribers.

NEW CASTLE, PA.—The Citizens' Telephone Company, operating in New Castle and Lawrence County, has been sold to a Philadelphia syndicate and sweeping improvements are scheduled for the local system. Every assurance has been given that the company will continue Independent.

SAVANNAH, TENN.—Arrangements have been perfected for the consolidation of the Savannah Telephone Company, the Tennessee River Telephone Company, the Clifton Telephone Company and the W. N. Sloan Telephone Company. Several extensions and improvements are contemplated.

LA CROSSE, WIS.—The La Crosse Interurban Telephone Company has purchased the Barre Mills Telephone Company. The officers of the new company are . G. Schweiser, president; C. H. Schweiser, secretary and treasurer, and W. D. Burford, superintendent.

NEW COMPANY NOTES.

TUCSON, ARIZ.—The Consolidated Telephone, Telegraph and Electric Comhpany has been organized to acquire and build a complete system of telephone lines throughout Arizona, New Mexico, Mexico and Western Texas.

RIVERSIDE, CAL.—A petition has been filed with the board of supervisors of San Bernardino County for a telephone franchise for a system extending from the west end of the Santa Fe bridge across the Colorado, southeast of Needles to Goffs, Daggett, Barstow and other desert towns, following the Santa Fe right of way into San Bernardino. The intention of the company is to commence work on the system within six months, and complete it within six months. It is backed by a rich Arizona syndicate, which has already control of paying lines in Arizona, Nevada and at Needles.

SAN FRANCISCO, CAL.—The Direct Telephone Company has been incorporated with a paid-up capital stock of $118,800, with headquarters at Bush and Kearney streets. The incorporators are Joseph A. Stulz, C. F. Runyon, Julius Fay, Robert Capelle, George W. Emmens, A. K. Andriano and C. K. Andriano. It is the intention to install a local system and also long distance lines connecting with other Independent companies.

WASHINGTON, D. C.—The Urie & Markham Telephone Tablet and Attachment Company has been organized with a capital stock of $30,000 by George Urie, Andrew A. Markham, L. A. McLaughlin, George M. Schafer and others.

CEDARVILLE, ILL.—The Cedarville (Stephenson County) Telephone Company has been incorporated with a capital stock of $7,000, by S. N. Roberts, S. F. Newhall and H. M. Fisk.

TROY, ILL.—The Troy Telephone Company has been incorporated with a capital stock of $10,000, by J. H. Steinhaus, J. W. Gornet and Christ Busse, Jr.

FRANKTON, IND.—The Farmers & Citizens' Telephone Company has been incorporated with a capital stock of $10,000. Incorporators: Thomas Bromley, Jr., E. H. Phillips and George A. Quick.

IDAVILLE, IND.—The Idaville Co-operative Telephone Company has been incorporated with a capital stock of $9,000, by T. B. Grim, J. F. Royer and T. J. Melom.

MAJENICA, IND.—The Majenica Telephone Company has been incorporated with a capital stock of $2,000 by George W. Gill, C. W. Myer and others.

ELSMORE, KAN.—The Katy Telephone Company has been incorporated with a capital stock of $6,000.

OLDHAM, KY.—The Oldham Telephone Company has filed an amendment to its charter, increasing its capital from $10,000 to $20,000.

WHITESVILLE, KY.—The Home Telephone Company will install a telephone system here.

GALENA, MO.—The Galena Home Telephone Company has been incorporated with a capital stock of $10,000.

ST. JOSEPH, MO.—The Fulton Long-Distance Telephone Company has been incorporated with a capital stock of $15,000, to operate a telephone line between this city and Fulton, Mo.

TROY, MO.—The Troy Telephone Company has filed articles of incorporation with a capital stock of $10,000. The incorporators are: J. H. Steinhaus, J. W. Gornet and Chris. Busse, Jr.

ELGIN, NEB.—The Antelope County Mutual Telephone Company, of Elgin, has been incorporated with a capital stock of $60,000.

STROMSBURG, NEB.—The new Polk County Telephone Company, of Stromsburg, has been incorporated with a capital stock of $100,000.

HALE EDDY, N. Y.—The Sherman & Hale Eddy Telephone Company has been incorporated with a capital stock of $7,000 by the following directors: John Thomas, N. N. Gordiner and Fred Kingsbury.

HIMROD, N. Y.—The Himrod Telephone Company has filed articles of incorporation with a capital stock of $2,000. The directors are: C. M. Van Dyke, E. P. Porter, H. S. Voorhes, W. A. McFarlin, Hiram T. Henderson and others.

MONTGOMERY, N. Y.—A meeting has been held at this place to take steps toward organizing an Independent telephone company. It is proposed

Digitized by Google

to make connections with the Orange County Telephone Company, of Middletown; the Colonial Telephone Company, of Newburgh, and the Highland Telephone Company, of Highland Mills.

SHENANGO, N. Y.—The Castle Creek & West Shenango Telephone Company, of Shenango, has been incorporated with a capital stock of $500. J. N. Brooks, of Castle Creek; Benjamin B. Worden, of West Shenango, and W. L. Treadwell, of Glen Castle.

CHERRY VALLEY, OHIO.—The Cherry Valley Telephone Company has been organized with a capital stock of $3,000 by W. A. Webber, W. E. Miller and others.

GIRARD, OHIO.—The Girard Telephone Company has been incorporated with a capital stock of $35,000, by W. Sotze, J. C. Koehle, E. L. Huser, S. C. Hazen, J. C. Jones, W. J. Wallis and R. T. Izant.

ARIEL, PA.—The Wayne & Lackawanna Telephone Company, of Ariel, has been incorporated with a capital stock of $8,000.

UNDERGROUND.

PINE BLUFF, ARK.—The Southwestern Telephone & Telegraph Company is arranging to put its wires in this town underground.

PERSONAL.

R. S. CHAMBERLAIN, general superintendent, and A. J. Mason, division superintendent, Pennsylvania Telephone Company, accompanied by Manager Moore, of the Pottsville Exchange, have recently inspected the lines from Pottsville to Reading.

O. W. F. CROSSLEY, manager of the Youngstown Telephone Company, has resigned to become State superintendent of the Colorado Telephone Company, with headquarters in Denver.

F. R. HILLHOUSE, brother of A. S. Hillhouse, manager of the Stark County Telephone Company, formerly in the employ of the Central Union Telephone Company, has accepted a position in the traffic department of the U. S. Telephone Company.

CHARLES KENYON, chief inspector of the Providence Telephone Company, with headquarters in Providence, has been appointed to the position of manager of the Pawtucket branch.

C. P. MEBANE, of Cleveland, has assumed charge of the Massillon Telephone Company. Mr. Mebane has had an extended experience.

JOSEPH A. MURRAY, of Wilkesbarre, Pa., has been appointed general manager of the Fort Worth, Tex., Telephone Company.

BEN. S. READ, manager of the Chattanooga exchange, of the East Tennessee Telephone Company, has been promoted to the management of its Louisville plant.

L. K. WEBB has been made manager of the local exchange of the East Tennessee Telephone Company, at Chattanooga.

L. WHITCHER has been appointed manager of the Portland office of the New England Telephone Company.

MISCELLANEOUS.

RIVERSIDE, CAL.—The Home Telephone and Telegraph Company has placed the contract for the installation of its new system in the hands of the Empire Construction Company, of Toledo, Ohio. This contract calls for the delivery on the first of January, 1905, to the new company of 750 telephones, subscribed for, installed and in working order.

HAZLEHURST, GA.—The Hazlehurst Telephone Company has nearly completed its system in this vicinity.

VAN BUREN, IND.—The exchange of the Independent Telephone Company, including switchboard, office fixtures, etc., were destroyed by fire.

DES MOINES, IOWA.—The Iowa Telephone Company is throwing open its plant for public inspection on stated days in the week.

SANBORN, IOWA.—The local telephone exchange had a very narrow escape from destruction by fire. Considerable damage was done, but the flames were kept out of the central office.

NEW IBERIA, LA.—The People's Independent Telephone Company is steadily increasing its number of subscribers. A new line is being built to Pahoutville, about ten miles distant. The line to St. Martinsville has been overhauled and is in first-class condition.

HOMER, MICH.—The Woodbury Telephone Company has instituted free service with the town of Clarendon and Butler. There are over 200 subscribers to the system, and over thirty orders for service to be filled.

KANSAS CITY, MO.—The Home Company now has upwards of 9,000 telephones in service, and has completed its long distance lines to St. Louis and all intermediate points. A complete list of toll stations in Kansas and Missouri will appear in the new directory, which will be distributed the first of the week.

PENDER, NEB.—Mr. Harrison, of Wakefield, the new manager of the Independent Telephone Company, expects to have 15 telephones in and around Pender at an early date.

CANANDAIGUA, N. Y.—The Canandaigua is to have Independent telephonic communication with farms and villages as soon as the Interlake Telephone Company is in operation.

CLEVELAND, OHIO.—The Cuyahoga Telephone Company has begun a very active campaign to secure new business now that the new switchboard is in order.

NEWARK, OHIO.—Manager C. E. Hollander, of the Newark Independent Company announces that the Gratiot & Browsville Telephone Company has signed a contract for interchange of toll business. It is proposed to connect Linnville, Brownsville, Gratiot, Mt. Sterling, White Cottage and other places.

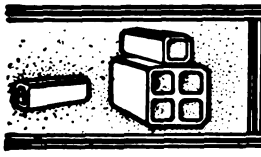
HARRISBURG, PA.—New telephones are being installed in all the offices of the Pennsylvania Railroad in the local shops. The new instruments are not much larger than an ordinary cigar-box, and when the receiver is taken off the hook the exchange is notified without the ringing of a bell as heretofore. There are seventy-five telephones to be installed, and they will be connected up as soon as possible.

PHILADELPHIA, PA.—The Keystone Telephone now has 14,205 instruments installed.

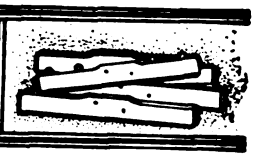
SPARTA, TENN.—The exchange of the Gainesboro Telephone Company was recently destroyed by fire.

QUITMAN, TEX.—The Quitman Telephone Company is negotiating a sale of the plant in this city.

SEATTLE, WASH.—The switchboard of the Independent Telephone Company was completely destroyed by fire recenty.



New Construction in the Field



KENDRICK, IDAHO.—The Inland Telephone Company is building a toll line to this town.

GLENARM, ILL.—A telephone line is being constructed between Glenarm and Chatham, which will shortly be completed.

HOPEDALE, ILL.—The Mutual Telephone Company is overhauling its system and putting in new cable.

WARREN, ILL.—The Jo Daviess County Telephone Company has installed its new switchboard in the Warren exchange and is now better equipped than ever before to handle the rapidly increasing business.

JONESBORO, IND.—Manager F. H. Neal, of the Home Telephone Company, states that he is putting forth every precaution to insure the best of service. He has a force of linemen at work on the lines, and some new equipments will be added so the system will be in the best condition by winter.

GRAETTINGER, IA.—The Graettinger Telephone Company has just completed its telephone system. It is thought they will purchase the Anderson system at Ruthven and consolidate the two systems.

SIOUX CITY, IA.—The Sioux City Telephone Company is receiving bids for the construction of its new exchange building to be erected on Jones street. The contract will be let August 3.

PELICAN RAPIDS, MINN.—The Pelican Telephone Company will extend its lines in every direction.

GLOUCESTER, N. J.—It is expected that the People's Rural Telephone Company, connecting farm houses in this county, will be in operation inside of a month. The main office will be at Wenonah.

HASTINGS, NEB.—The Farmers' Telephone Company has been connected with Trumbull. The entire system will be in working order shortly.

FULTON, N. Y.—The Fulton Telephone Company has nearly finished its new line between here and Rochester. The line will connect all the larger towns between these two cities, among which are Hannibal, Fair Haven and Sodus.

HAWLEYTON, N. Y.—The telephone company is stringing its wires and will soon be ready for service.

ROME, N. Y.—The Rome Independent Telephone Company is figuring on a number of improvements to take care of its increasing business. The switchboard will be added to, two new sections being built, and 20,000 feet of additional cable will be strung. The company has in the neighborhood of 1,100 subscribers, and is adding constantly to its business.

SALEM, ORE.—The trustees of the Rural Telephone Company, of Rosedale, No. 1, have filed an application in the county court for right-of-way for the construction of telephone lines in the Rosedale and Sunnyside districts, south of this city.

OKLAHOMA CITY, OKLA.—A telephone line has been completed from Oklahoma City to Davis, I. T.

FINLEY, N. D.—The Union Telephone Company has a force of men at work rebuilding its line from Blabon to Finley. A rural line running east and north will also be constructed.

CECIL, PA.—The Cecil Farmers' Telephone Company will begin the erection of its line in a few weeks.

NORTH EAST, PA.—The Mutual Telephone Company is extending its line to Ashton.

SHARON, PA.—The Union Telephone & Telegraph Company will rebuild its lines in this vicinity.

YANKTON, S. D.—At the meeting of the county commissioners a resolution was adopted giving the Independent Telephone Company of Yankton permission to use the roadways through the county for the purpose of setting poles for a long distance telephone line. E. A. Bruce is president, and J. J. Wagner is secretary of the company.

HECLA, S. D.—The Hecla Social Telephone Company will extend its Aberdeen-Hecla line through the township of Brainard.

CLARKSVILLE, TEX.—The Independent Telephone Company has begun construction on its exchange. It has just reached the city with the wires from Texarkana.

GALVESTON, TEX.—Nearly one-half million dollars will be spent by the Illinois Central Railroad in organizing the telephone system over the entire route from Chicago to New Orleans.

TABOR, TEX.—C. Clayton, J. Castale, J. Wiley, A. Dean, O. Wilcox and E. T. Gallatin are interested in a new line which will be built from Bryan to Cotton Wood Prairie. There will be about twenty instruments on this line.

CALDWELL, TEX.—The Trans-Texas Telephone Company has bought a controlling interest in the Deanville and Dime Box telephone line. It will extend the line to Hookerville. The company also contemplates putting in a line from Caldwell to Hix and Rita.

VIRGILINA, VA.—The Virgilina Telephone Company will extend its line to Buffalo Springs, Va., where it will secure connection with the Home Telephone Company, of Henderson, N. C., which has over 4,000 telephones in use.

WHEELING, W. VA.—The National Telephone Company, of Wheeling, will have direct connections with the Enterprise Telephone Company, of New Martinsville.

EAU CLAIRE, WIS.—The Wisconsin Telephone Company has started work on its $50,000 exchange building and underground system at Green Bay.

BELOIT, WIS.—A deal has been made between the Home Telephone Company and the Badger State Telephone Company whereby Beloit will be connected by an Indenendent telephone line with Rockford and other northern Illinois towns. This means the opening up of the whole of southern Wisconsin to the people of Rockford by telephone, as well as direct communication as far north as St. Paul, Minn.

JEFFERSON, WIS.—The Wisconsin Telephone Company is putting in a new line between this city and Helenville.

MILWAUKEE, WIS.—The Independent Consolidated Telephone Company is preparing to enter Milwaukee.

Digitized by Google

TRADE NOTES

THE STROMBERG-CARLSON TELEPHONE MFG. CO., of Chicago, has recently closed a contract with the Royal Telephone Company, of Front Royal, Va., for a switchboard and equipment.

THE BAIRD MANUFACTURING COMPANY, of 4 Michigan street, Chicago, has just received a large order from the Independent Telephone Company, of Seattle, Wash., for its three slot pay stations and a time stamp.

THE INTERNATIONAL TELEPHONE MANUFACTURING COMPANY, Chicago, Ill., reports a continual demand for its "lightning proof" bridging telephones and its non-infringing self-restoring drop switchboard equipment for rural village exchanges and country party line systems.

FRANK B. COOK, 238 West Lake street, Chicago, reports the recent shipment of more than two hundred pole cable terminals to the Pittsburg & Allegheny Telephone Co. One hundred more are nearly completed for shipment. The Fittsburg & Allegheny Telephone Co. is using some of these terminals for its McKeesport exchange, the balance being for some of its other exchanges.

W. N. MATTHEWS & BROTHER, of 619 Carleton Bldg., St. Louis, Mo., are distributing an amusing folder. A Johnny of the don'tcher know variety is called upon to address a meeting, but his memory fails. However, he is able to make it quite plain to his audience that it doesn't require a very bright man to see the advantages of a Stombaugh guy anchor, in fact, it is simplicity itself. This folder will be mailed upon request.

THE KESTER ELECTRIC MANUFACTURING COMPANY, of 44-56 N. Union street, Chicago, Ill., has a very unique exhibit at the World's Fair, St. Louis. It is a clock 7 feet 5½ inches high, made exclusively of ordinary pins joined with Kester Self-Fluxing Solder. Over 15,000 pins were used in its construction, and it weighs 40½ pounds. Mr. F. G. Dickerson, secretary of the company, designed and executed this remarkable piece of work.

THE HARVARD ELECTRIC COMPANY, 62 West Van Buren street, Chicago, has been manufacturing telephone fuses, lightning arresters, etc., for nearly fourteen years, and is one of the pioneer manufacturing companies in the telephone field. The fact that it has been in business so long and with a constantly increasing trade is good evidence that its line of telephone arresters is meritorious. A new catalogue, No. 14, is now ready and will be mailed upon request to all who mention THE AMERICAN TELEPHONE JOURNAL.

G. M. GEST, the expert subway contractor, has been awarded a contract by the Toronto Railway Co., Toronto, Can., for the construction of its underground subway system, covering the main thoroughfares of the City of Toronto. Work is to be completed as soon as possible, and a large force of men will be employed. This is part and parcel of the many improvements inaugurated in the reconstruction of the electrical equipment of this railroad, which is being changed in all respects to make it absolutely modern and up to date.

THE CONNECTICUT TELEPHONE AND ELECTRIC COMPANY, of Meriden, Conn., has made a special offer on its solid back transmitter and will mail new customers one sample by mail prepaid for $1. This offer is for a short time only. The company has made many of its customers in this way. This transmitter is scientifically and carefully constructed and is guaranteed not to pack or deteriorate with years of constant service. The tones are perfect and it has great volume. It is also moisture-proof. The company states that it has secured a permanent customer whenever one of these transmitters has been sold. Its new and enlarged catalogue is now ready and will be mailed on request.

JULIUS ANDRAE & SONS, Milwaukee, Wis., have recently issued their catalogue No. 10, which deals very thoroughly with the switchboard apparatus and instruments manufactured by this company. Particular attention has been given to the design of the various pieces of apparatus, all of which carry a first-class guarantee. The company claims to spend more money on its assembly than any other manufacturer, and has acquired the reputation of sending out nothing but perfect apparatus. All the cabinet work is taken from selected stock and skilfully put together. Wiring connections are made in the very best possible manner, and every precaution is exercised in the testing of the apparatus. Particular attention is drawn to the giant generators, which the company claims to be the most powerful on the market. Various types of switchboards are thoroughly described, together with the four party selective signalling system, which this company advocates. This catalogue will be sent upon request.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE.—Eureka Electric switchboard, 200-line capacity; now in use; can be delivered after September 1st. Will sell cheap. Address, W. M. Clark, Baldwin, Kas. 221

FOR TRADE.—Good farm, well improved, 241 acres; value, about $12,500; for paying telephone plant. Address, Box 457, Oxford, Ohio. 218

EXCEPTIONAL BUSINESS OPENING.—Want to meet a man or syndicate that can invest $20,000 cash at once and can furnish credit promptly to the amount of $80,000 more in a telephone proposition near Kansas City, Mo., with or without service. Address—with reference, no agents—Theodore Gary, Macon, Mo. 207

WANTED

Advertisements under this head, 25 cents for 25 words or less for each insertion. Prepaid.

The 1900 Dry Battery

THE most needed quality is reliability. No one wants a battery that will respond all right for a week or ten days then "suddenly go out of business." Another requirement is that it shall continue "strong" during its life. These two requirements besides many others are characteristics of

1900 BATTERIES

We guarantee them not to freeze, leak or break; we warrant them to work with a strong, steady current during their life (anywhere from six to eighteen months).

They are compact, always ready. They are better than wet batteries—no slop, no repairs, no breakage. Any one can replace a worn out one at a moment's notice. They can be carried anywhere—always ready for instant use.

Write us for our Complete List of Batteries and Telephone Supplies

A New Series of Telephone Books, entitled

"TELEPHONY"

IN SIX VOLUMES

By ARTHUR VAUGHAN ABBOTT, C. E.

Four volumes are now ready. They embrace the following subjects:

Part I.—THE LOCATION OF CENTRAL OFFICES.
170 pages, 33 illustrations.

Part II.—THE CONSTRUCTION OF UNDERGROUND CONDUITS.
190 pages, 62 illustrations.

Part III.—THE CABLE PLANT.
152 pages, 51 illustrations.

Part IV.—CONSTRUCTION OF AERIAL LINES.
263 pages, 140 illustrations.

Two remaining volumes will be ready in October (Orders taken now). They are:

Part V.—THE SUBSTATION.

Part VI.—SWITCHBOARDS AND THE CENTRAL OFFICE.

The price of each Part is $1.50, postage prepaid. The price of the entire set (six volumes) is $6.00, postage prepaid.

FREE TO OUR SUBSCRIBERS

How You can Secure the Entire Set Free:

Send us 20 **new** subscribers to The American Telephone Journal at $1.00 each, a total of $20 00. We will then send you, all charges paid, the six volumes free.

How You Can Secure One Volume Free:

Send us 5 **new** subscribers at $1.00 each, a total of $5.00. We will then mail the volume you desire free.

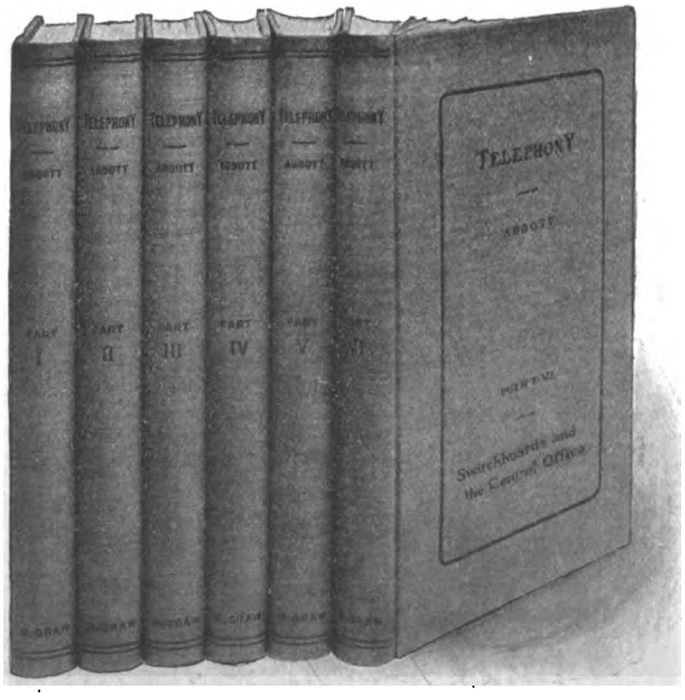
Another Way to Secure the Set:

For $7.00 we will give two yearly subscriptions to The American Telephone Journal, (one of which may be a renewal) and a complete set of six volumes.

For **$7.50** we will give three yearly subscriptions, one of which may be a renewal and a complete set.

For **$8.25** we will give four yearly subscriptions, one of which may be a renewal, and a complete set.

For **$9.00** we will give five yearly subscriptions, one of which may be a renewal, and a complete set.



THE PUBLISHERS IN ANNOUNCING THIS NEW WORK SAY:

"There is telephone literature galore that occupies itself with the discussion of the theory of receiver and transmitter, and a description of the various forms of apparatus used in building telephone exchanges. But there is little information that concerns itself with the engineering design of telephone plants. It is the attempt of the author in this series to prepare a manual that shall deal with the latter phase of the problem, with particular reference to a consideration of the economic features, which lead to the installation of the best plant for the least money."

Advise us at once which of these propositions you intend to accept, so that we can make the necessary arrangements.

You Will Find It Pays To Test

your lines periodically for insulation and resistance, This can be best done with a Volt Ammeter. Mine are especially designed for this branch of telephone work and are low in price.

LOUIS M. PIGNOLET

Originator of the Voltmeter Habit.

78 CORTLANDT ST., NEW YORK

One Man

out of one hundred interviewed said he preferred a monthly paper.

"Why?" he was asked.

"Because" said he, "the monthly is larger."

He was not pressed to subscribe to The American Telephone Journal, because—well the reasons are entirely obvious.

American Telephone Practice

By KEMPSTER B. MILLER, M. E.

518 large pages, profusely illustrated with 380 diagrams and cuts of apparatus **$3.00**

A book for the telephone man. It is an encyclopedia of useful information concerning telephony.

It gives complete specifications, enabling you to intelligently order apparatus from manufacturers, and to properly supervise the installation of an exchange, large or small.

It describes in simple language the theory and practice of modern telephony, including circuits, mechanical construction and operation of telephones and switchboards.

A complete description is given of storage batteries, their care and maintenance; of aerial and underground line construction, and, in fact, all the important matters which telephone men need to know.

THE AMERICAN TELEPHONE JOURNAL

"Of Inestimable Value"--

So says one of our old subscribers. He has just written us to discontinue his paper (which we greatly regret to do). But we take pride in quoting his letter:

"My subscription expires the 6th of August. You will please discontinue sending the Journal to me as I am out of the Telephone business.

"To those who are interested in Telephony your Journal is of INESTIMABLE VALUE".

"N. I. STRINGER, D. V. S.
Watseka, Ill."

Such a testimonial, coming as it did absolutely unsolicited, from one no longer interested, shows strikingly the popularity and the value of the AMERICAN TELEPHONE JOURNAL.

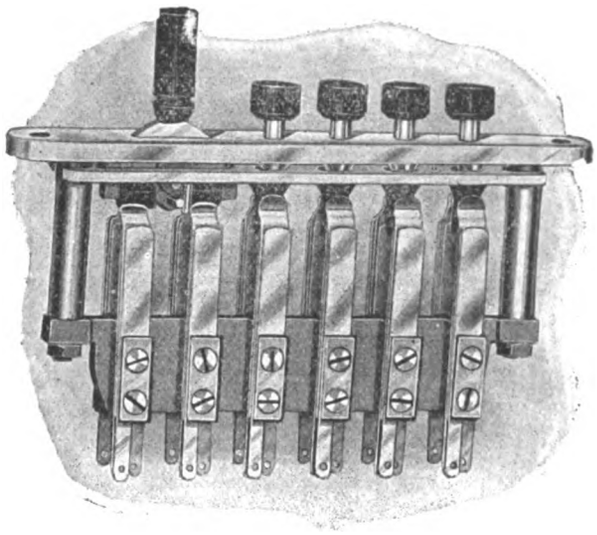
Stromberg-Carlson INDIVIDUAL AND MASTER Four-Party Indicating Keys



No. 86 Key

Push Buttons for selecting proper ringing current. Button after being depressed until it locks, remains in that position until another button is operated or until ringing key is thrown into listening position.

The Ringing is done with the lever key.

Talking circuit in this key is as free from contacts as an ordinary metallic circuit ringing key.

The best practice is to install one of these keys in each cord circuit.

GIVE THE BEST SERVICE

No. 91 TWO OR FOUR-PARTY MASTER KEY

Five selecting buttons and one release button. The key operates similar to the No. 86 as far as selecting is concerned but ringing is performed with the regular ringing key of the cord pair in use.

We have a four-party master key No. 93, which is similar to the No. 91, except that it has four selecting buttons instead of five. Where only a small number of party lines are operated, it is common practice to install a master key in each operators posi ion.

Printed matter mailed upon request.

WHITNEY INSTRUMENTS ENJOINED

Full opinion of His Honor Judge Wheeler, concurred in by His Honor Judge Lacombe in the case of the

WESTON ELECTRICAL INSTRUMENT CO., Complainant

vs.

WHITNEY ELECTRICAL INSTRUMENT CO., Defendant

This suit is brought upon patent No. 392387 dated November 6, 1888, and granted to Edward Weston for an Electrical Measuring Apparatus, which was adjudged to be valid in Weston Electrical Instrument Co. *vs* Jewell Electrical Instrument Co. et al in this Court in March, 1904. It has now been heard upon a motion for a preliminary injunction.

The principal question made now is as to infringement. **The parts of the defendant's instrument look quite differently from the corresponding parts of the instrument of the patent, but notwithstanding these differences in form they are there in the instrument and do the same things in substantially the same way.** This appears quite well from the description of the two instruments in parallel columns in the affidavit of Frank W. Roller, defendant's record on this motion, page 3. The great thing to be done appears to have been to get the movable coil in its diamagnetic frame into a permanent magnetic field, compactly, and to carry the current to be measured from side to side through the coil, and move the coil against steady resistance to measure the current, and record the measurement. Weston seems to have accomplished this by mounting the frame by pivots on non-conducting bridge-pieces, and carrying the current to be measured to and from the movable coil through springs connected with the frame furnishing steady resistance, and a pointer connected with the frame and moving over a scale to show the movement and the measurement of the current.

Any electrical mechanic could provide the permanent magnetic field, and the form of it would not be material except to permit the movement of the frame carrying the coil. The mounting of the frame on the bridge-pieces by pivots with its arrangements and connections was the important part of Weston's patented invention.

The defendant's instruments have the permanent magnetic field provided by a magnet and core of different and perhaps better shapes in some respects, but permitting movement of the frame in an arc of a circle to carry a pointer moving over a scale to indicate the measurement of the current. **If these changes of forms are even patentable improvements the defendants have taken and used the invention of the patent in making and using those improvements.**

The difference in the form of the parts carrying the frame on pivots supported by the bridge-pieces is of the same sort. It does not vary the mechanical operation of the parts. **These differences do not, any or all of them, amount to doing the same thing in different ways, but leave the operative parts doing the same thing in the same way.**

According to these views the motion should be granted.

HOYT H. WHEELER.
Judge.

FOR PLAINTIFF:
WILLIAM HOUSTON KENYON.
FOR DEFENDANTS:
CLIFTON V. EDWARDS.

Upon re-examination of the record, I concur in the opinion above expressed by Judge Wheeler.
July 18, 1904.
E. HENRY LACOMBE,
U. S. C. J.

(ENDORSED) Circuit Court of the United States, for the Southern District of New York.—Western Electrical Instrument Company *vs.* Whitney Electrical Instrument Company *et al.*—Opinion, WHEELER, J. —United States Circuit Court, Southern District of New York. Filed July 20, 1904.

REASONS.

1. Our Company is officered and owned by Pioneers in the Telephone Business.

2. They are **Operators** of exchanges aggregating over 35,000 subscribers.

3. They **Operate** over 3,000 miles of Toll lines.

4. They are posted on the wearing qualities of the various makes of Telephones and know their weak points.

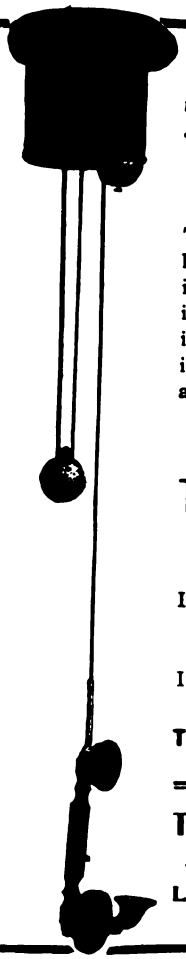
5. These weak points do not exist in "Eastern" Telephones.

6. Who can be better qualified to judge of good apparatus than **Operators** of the **Largest Independent Systems in the United States.**

7. If built for their use, with the weak points eliminated, are they not good for your use.

8. Send us a Sample order for trial. Return Telephones if unsatisfactory.

Eastern Telephone Mfg. Co.
WEST CHESTER, PA.



Just why does the Telephone save us time, and therefore money, and prove such a social convenience?

It Abridges Distance!

This is not accomplished to the last degree, however, by merely bringing the instrument into the house, or the room, or even by standing it on or hanging it to the desk—usually in the way of something or with something in its way, and requiring reaching, awkward attitudes, and re-arranging.

On the other hand

The Pendent Telephone

DOES ACCOMPLISH THIS

It drops from the ceiling, at "the crook of the elbow."

It is never in the way, and never out of the way. Write us for its

A TOLL TESTING SET.

By P. Kerr Higgins.

In testing toll line circuits a much larger degree of accuracy is required than is usually found necessary for the ordinary circuits. It must not be understood, however, by this statement that any less vigilance is required for tests for faults on local lines, but that in the case of toll line circuits there are conditions to be met and overcome that are hardly noticeable in the subscriber's lines or in any of the switchboard circuits.

Balance, induction, and capacity, are factors in toll line working which must be thoroughly understood to allow of any successful operation. In the case of a local circuit it is a comparatively easy matter to locate faults and to apply the remedy, but in the case of long toll lines, as any experienced manager or wire chief knows, the bug upon the line is as evasive as the average fly and a good deal harder to locate and kill.

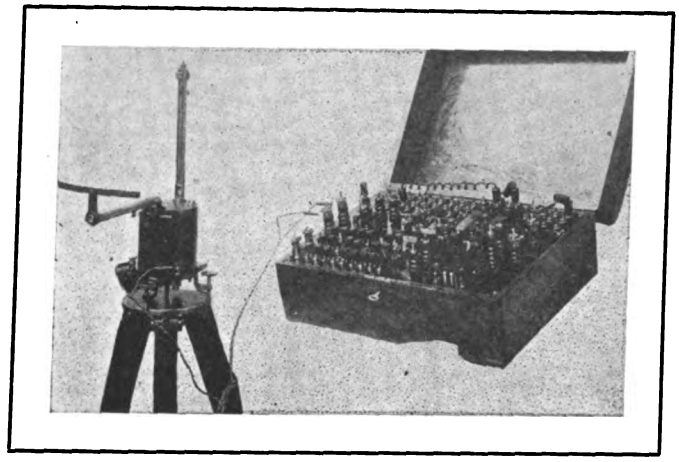

Fig. 1. Galvanometer and Bridge.

Some toll lines are as nearly perfect from the transmission standpoint as possible in a dry atmosphere, but let the weather become damp or rainy, then the lines are unworkable on account of noise. Other toll lines which in dry weather are very poor in transmission qualities are improved a hundred per cent. by wet weather. To find out the cause of these discrepancies, and to locate the position of other troubles, such as grounds, shunts, opens, etc., necessitates very accurate measurements for several reasons, the most important one of which is the saving of time.

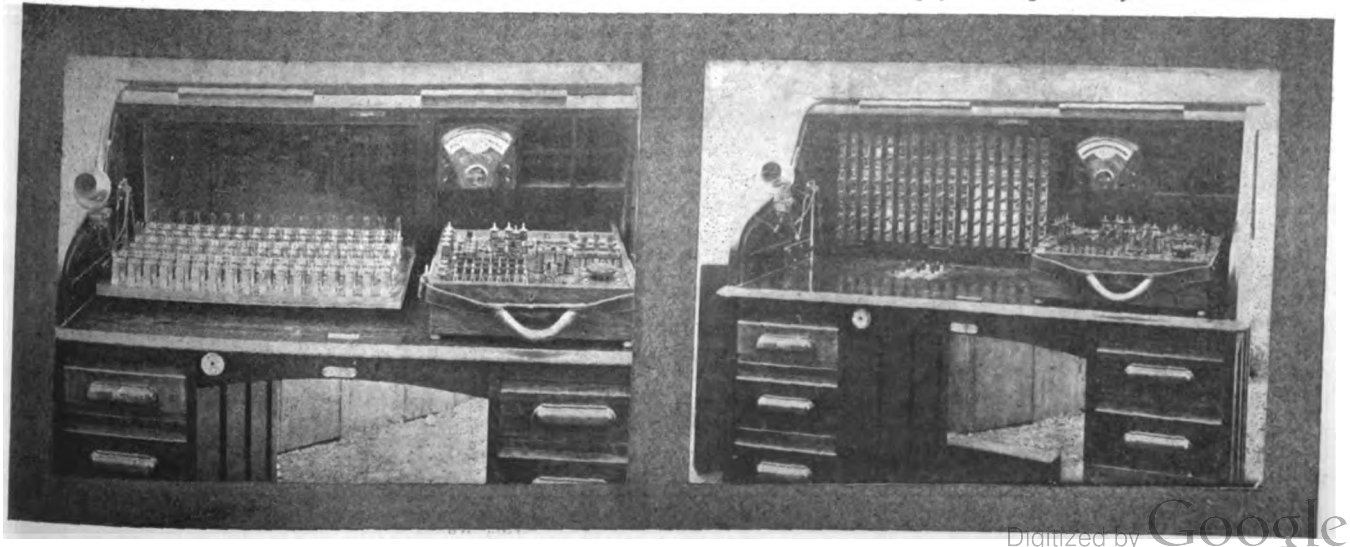
As an example, a toll line, say, fifty miles long on a listening test, becomes periodically noisy; the voltmeter indicates a swinging ground; the question for the wire chief to decide is the approximate location of the trouble, so that the lineman nearest the location of the fault may be sent to clear it. In a case like this, location is everything, for it is obvious that to send a man out from the office to go over the line would be a great waste of time and unnecessary cost not only from the point of maintenance, but also from the damage that poor trunk or toll line service does to a system.

To meet the demands of testing suitable for toll line work the writer designed the desk shown in Figs. 2 and 3. Amongst other special features might be mentioned that the circuits and keys are so arranged as to permit listening in on a toll line to see if in service and also to cut the line in two, to permit of testing and locating the trouble whether in the office or on the line. This is done by a double key, the upper portion being for listening in on line and is non-locking. The lower when in the normal position (straight up and down) connects the Central Office toll desk with the toll line. By pressing the key down or up as desired, the line is divided into two parts for testing purposes and the key in these positions is locking. The keys on the flat part of the desk are for cutting in the telephone, the voltmeter, testing battery and Wheatstone bridge at will. A reversing key for throwing battery out on either side of the line and for grounding is also provided.

With the apparatus is furnished a standard Weston direct reading voltmeter with two scales, reading from 0 to 15 and 0 to

Fig. 2. Showing Arrangement of Key Bank.

Fig. 3. Showing Desk Keys.



Digitized by Google

150 voles, respectively. The telephone instrument is an Adjustaphone, as will be noticed in the cut and the Wheatstone bridge is of the Queen pattern and is used in conjunction with the D'Arsonval dead beat galvanometer illustrated in Fig. 1. This galvanometer is only used when fine testing is necessary, and for all ordinary work the voltmeter or a head telephone is used. The whole apparatus is so arranged that it can be locked up in the desk when not in use.

The desk was constructed in the shops of the Home Telephone Company at Los Angeles.

The general arrangements of the circuits, shown in Fig. 4, possess some points of interest. Special provision is made for testing for unbalanced conditions by using a receiver bridged across

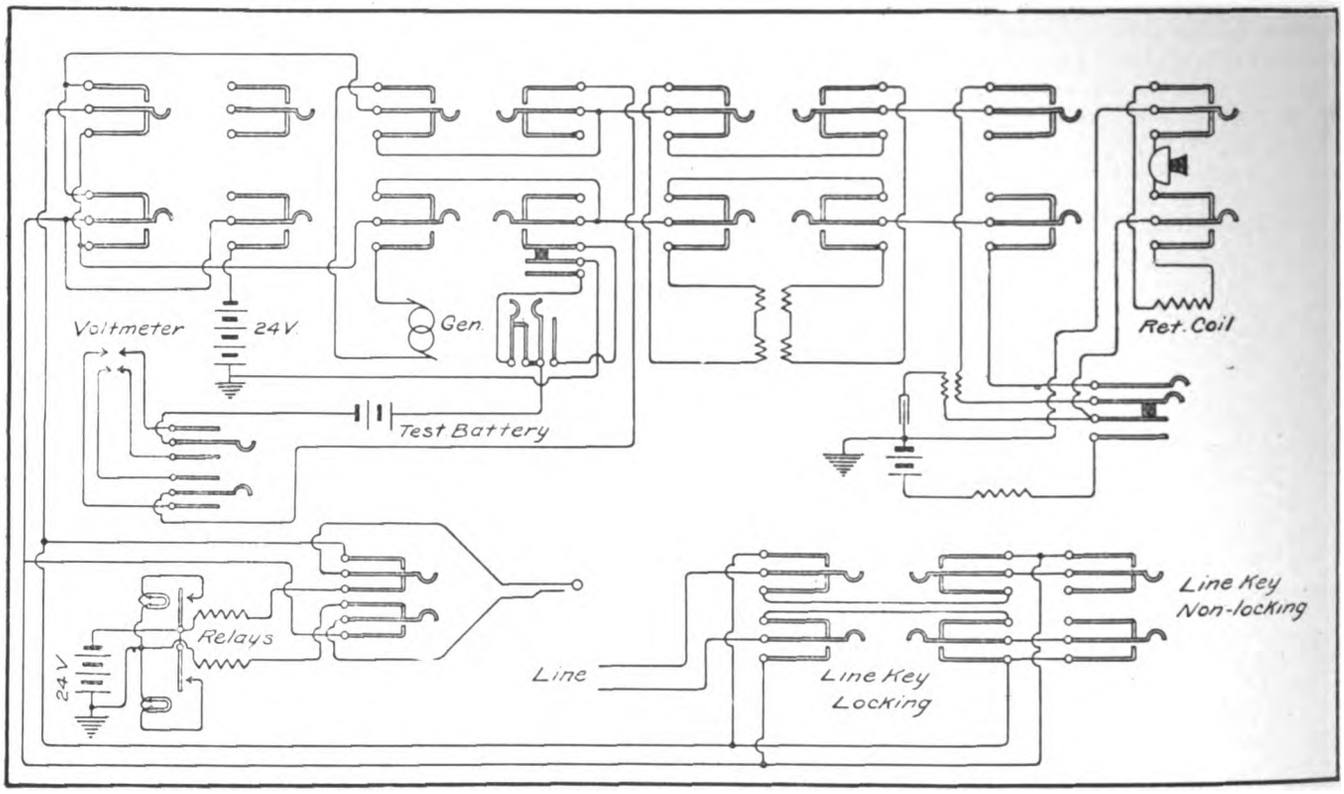


Fig. 4. Circuit Arrangement.

with 500 ohms on any line. This is also used for observing talking efficiency. The desk is used and operated by the wire chief, so that the special services of an extra man are not necessary. The main feature in the design of the apparatus was to secure the maximum efficiency with the minimum of complications. Since almost all circuits possess some arrangements which are not always clear a large amount of time and thought was given to secure the deserved quality of simplicity combined with speed in operation. That this has been accomplished to a great extent is evidenced by an operator being able to test each and every of the fifty toll lines in less than five minutes. A record is taken of all the bad lines, which is a policy of the utmost value and a guarantee of expediency, and these are taken up separately later, the faults being examined carefully and more elaborate tests are made to locate the exact nature of the trouble and its approximate distance from the testing station.

The preliminary test of all the lines is made by placing the voltmeter key in the testing position and pulling down the key on each line one after another. A predetermined reading on the voltmeter scale indicating low resistance.

In the circuit drawing it will be seen that the large and small scales of the voltmeter are connected to a special key. This allows a rapid interchange of tests for certain troubles. The line circuit is separate until pulled into the testing position, the testing apparatus being common to all keys.

With this arrangement of test circuits it is possible to locate almost any fault that may occur on a toll line and also determine its extent and position with a very large amount of accuracy and dispatch.

TELEPHONE TAXATION IN INDIANA.

THE relative conditions of the Bell and Independent companies of Indiana were put forcibly before the tax commissioners of that State on July 22d, when Mr. Theodore Thorwald, president of the South Bend Home Telephone Company and of the Indiana Independent Mutual Telephone Association, called the attention of the board to the extremely inequitable tax rating now prevailing. Mr. Thorwald pointed out that the State Bell corporation, the Central Union Telephone Company, was assessed $56 per mile of toll line, while the Home Company was obliged to pay $90 per mile, although the earnings of the Independent toll lines were below those of the Bell.

Mr. Thorwald then stated that seventy-five per cent. of the money put into Independent telephones in Indiana was placed there not as an investment, but with the intention to relieve the people from the Bell monopoly. The speaker called attention to the well-known free-rate tricks of the Bell during a competition, and the quick raising of prices after that company had re-established its monopoly in a particular place.

"In Fort Wayne," said Mr. Thorwald, "the Central Union Company did not even ask for a general franchise, but simply for the franchise on the main streets, where it was easy to locate telephones. If a man on a side street wanted a telephone he could not get it. As a consequence, the Home Company, of Fort Wayne, was incorporated by the citizens, and has given to

Digitized by Google

poor and rich alike a telephone service at reasonable rates. In fact, it has benefited the people of Fort Wayne more than its stockholders.

"At South Bend," continued the speaker, "The Home Company is the real successor of a previous Independent concern, the Citizens', which was first weakened by competition and then bought in by the Bell interests.

"When the South Bend Home Company was organized, we had to build toll lines to the surrounding counties to connect with the Independent telephone companies. At present we have about 500 miles of toll lines. We believe that if the State must receive a certain amount in taxes, it ought to receive it to from the Bell monopoly, which represents foreign capital sent in the State for the purpose of depreciating home institutions. The Bell company just now is making its hardest fight against our Independent telephone companies, claiming that with its $20,000,000 of extra capital it will either force the home companies to sell or will crush them out of existence with free service. The stockholders of the Independent telephone companies are Indiana taxpayers and citizens interested all over the State in other industries besides the telephone business, and we believe that the tax board ought to take this fact into consideration."

THE INDEPENDENT TELEPHONE ASSOCIATION OF OHIO

AT a meeting of the Independent Telephone Association of Ohio, held at Columbus last week, steps were taken for the formation of a national association, composed of all Independent telephone interests in the United States and the standardizing of equipment with a general uniformity in plan and purpose with regard to them.

A committee of the members of the State association was appointed as follows: J. B. Hoge, of Cleveland; Ed. L. Barber, of Toledo, and Cyrus Huling, of Columbus.

At a recent meeting, the State of Ohio was divided into nine Independent districts. Meetings of these districts were called as follows: Cleveland, Aug. 16; Toledo, Aug. 17; Lima, Aug. 18; Dayton, Aug. 23; Hamilton, Aug. 24; Chillicothe, Aug. 25; Columbus, Aug. 30; Zanesville, Aug. 31, and Canton, Sept. 1.

At these district meetings arrangements will be made for the election of delegates, to represent them. This State association meeting will elect delegates to meet representatives of other State associations.

One of the drawbacks of the Independent telephone interests of the country, Independent telephone men say, has been lack of a close and representative organization. In the past there has been no organization of this kind. National meetings have been held, and the smaller companies, it is asserted, have had the same voice as the larger and more influential ones. Under the present plan it is expected to have a more general representation and at the same time so apportion the delegates that they shall have voice more according to the importance of the companies or districts they represent.

According to J. B. Hoge, one of the first things to be taken up will be the attempt to secure the standardizing of all Independent telephone equipment. Said Mr. Hoge in discussing the project: "Standardizing of equipment is one of the things that has become a most important problem for the Independent telephone interests. So long as there is such wide diversity in the apparatus and methods of the Independent companies, as exists at the present time, it is not reasonable to expect the best results. In almost every other line of business this principle of standardizing has been most successfully applied. The time has been ripe for some such move on the part of the Independent telephone companies for some time and all that has been needed is some one to give it a start. That we propose doing and shall keep at it unttil we attain results."

At the coming local meetings in Ohio, the question of uniformity will be given first attention. Investigation will be made into the trouble which may have arisen from a varied equipment and immediate steps will be urged to remedy this, when changes are made and new supplies of any kind secured.

Mr. Hoge is already in communication with the Inter-State Independent Telephone Association with the intention of getting it interested in the project. This association is made up of representatives of the various Independent companies in States of the Middle West. It will probably take up the plan at its first meeting. The old Independent association will also be communicated with and the plan presented to its members.

Another thing Ohio Independents are working for is the universal adoption of the Blue Shield as the mark of the Independent long distance lines. At a recent meeting of long distance telephone men at Indianapolis, the use of this mark was decided upon but its universal use is believed to be of great importance to the Independents.

"While I was in St. Louis the other day," said J. B. Hoge, "it seemed to me that I was confronted by 'the Blue Bell' of the Bell Company at every way I turned. And this, too, in the face of the fact that the Independents had more long distance offices than did the Bell."

A number of other things of importance will be taken up from time to time, by the proposed organization. One of these will be the question of telephone insurance now under consideration by a committee in Ohio.

Cleveland Independents expect much from the proposed organization. Quoting Mr. Hoge again: "The power and importance of the telephone interests of the United States are not fully recognized. We can get together as able and representative a body of men as any business in the country and the only thing necessary is simply to get them together. To bring these men together so that they will attract the attention of the financial and banking interests of the country, will be of great and far reaching importance to the telephone business."

The following Independent telephone men of the State were present at the Columbus meeting: Pres. F. L. Bean, of Columbus; Cyrus Huling, of Columbus; Dwight Sapp, of Mt. Vernon; Ed. L. Barber, of Toledo, and J. B. Hoge, of Cleveland, comprising the executive committee; and W. F. Laubaugh, of Akron; J. B. Rhodes, of Zanesville; Thorpe, of Wilmington; J. C. Reber, of Dayton; George Metheany, of Lima; Hamblin, of Toledo; E. E. Knox, of Portsmouth, and Reamer, of Columbus.

SEVENTEEN-YEAR ACCOUNTING.

SPECIAL MASTER EVERETT W. BURDETT, in Boston, Mass., has started hearings in the American Bell Telephone-Western Union Telegraph Company royalty suit. Five hearings have thus far been held.

These hearings are being held in accordance with the decree of Judge Colt, of the United States Circuit Court, as of February 3, 1904, ordering the American Bell Telephone Company to furnish to a master an accounting to determine to what extent it is obligated to the Western Union for failure to turn over for seventeen years 20 per cent. of the stock and dividends it received from sub-companies in addition to 20 per cent. of the cash rentals.

The rental and royalty contract was made between these companies in November, 1879, and the Western Union Telegraph Company. The amount involved is variously estimated at between $2,000,000 and $4,000,000. In return for the royalties and rentals the Western Union agreed to go out of the telephone business, and turned over all its telephone property to the Bell Company, the latter also agreeing not to interfere with the telegraph business.

THE NEW PITTSBURGH & ALLEGHANY EXCHANGE AT McKEESPORT.

By H. A. Lane.

ALTHOUGH Independent telephony has made its greatest strides in the States of Ohio and Indiana, yet Pennsylvania is not far behind in the matter of up-to-date exchanges with independent toll lines which give the major portion of the State a moset efficient telephone service. Of those systems which have made this state of affairs possible, the Pittsburg and Allegheny Telephone Company is one of the foremost. This company's system of exchanges radiate in almost all directions from the city of Pittsburg and in every case they represent the most modern method of telephone engineering. The new plant of the Pittsburg and Allegheny Company which is the subject of our article, is an illustration of the thoroughness with which this company conducts its business. It might be said here, that not a small portion of the excellent results that have been achieved by it in competition with the Bell systems operating in this territory, is due to the foresight of the engineers in providing for expected and unexpected growth and in making the system as nearly perfect as possible.

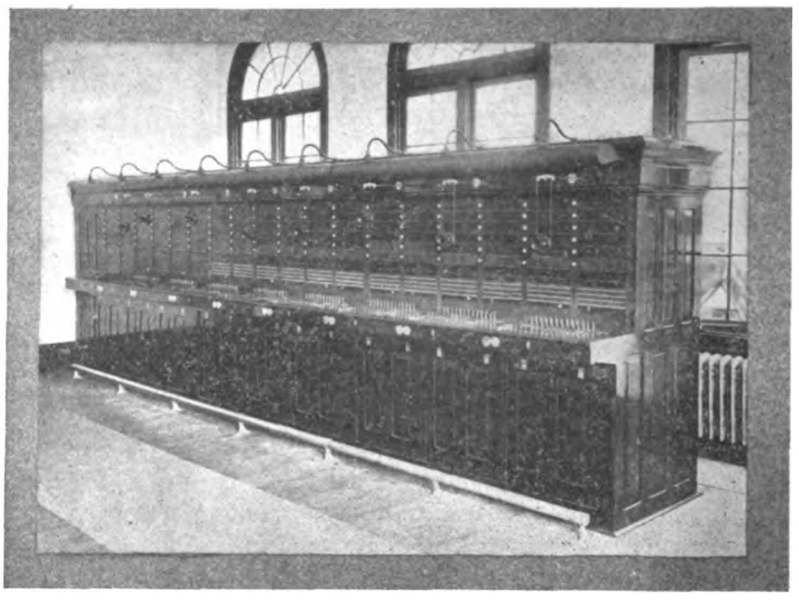

Fig. 1. Main Switchboard.

considering the cost of a system to curtail in some manner, the expense with the idea that that part of the system which has been omitted to secure a financial saving has been of little value. Innumerable instances could be pointed out where the tendency toward the "penny wise and pound foolish" idea has been the ruination of not only Independent but Bell companies as well. It is, therefore, with great pleasure that one is able to look upon a system such as this to investigate its merits and to find, when tried in the balance, it is not found wanting in any of the necessary essentials or general apparatus, which collectively represents the equipment of a first class system. The motto which should represent Independent telephony is well expressed in the old time-worn, but still valuable phrase: "Nothing is worth doing unless done well." The most modern idea as regards achitectural design, as applied to telephone buildings, have been drawn upon extensively in the design of the building illustrated in Fig. 3. Perhaps one of the most necessary qualifications of an up-to-date telephone building

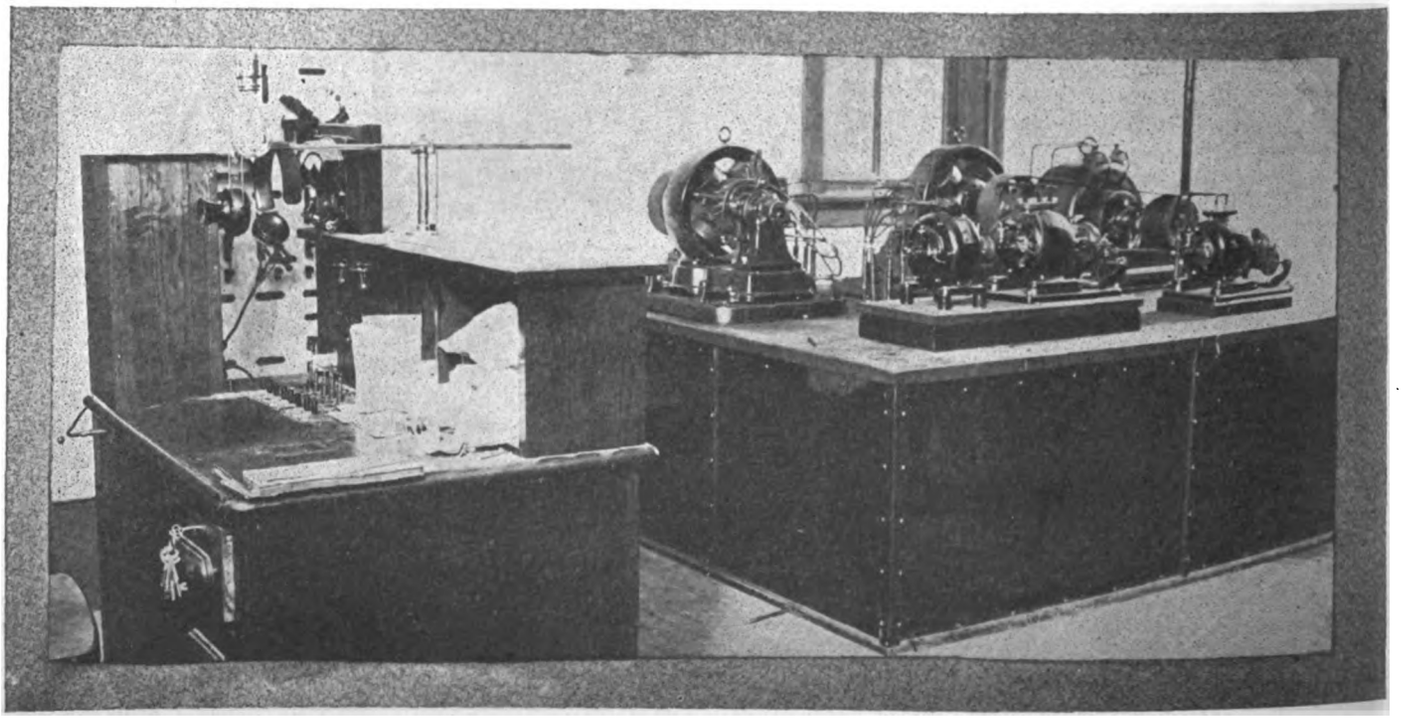

Fig. 2. Wire Chief's Desk and Power Apparatus.

Although the plant has been built with remarkable rapidity, no details which make for economy in operation, flexibility of system or the comfort of the employees have been overlooked.

It has often been the custom of Independent companies when is a maximum amount of light and, secondly, hygienic conditions which allow of perfect ventilation.

That this has been secured in this case is evident from the location of the building which is open on all sides. The structure

Digitized by Google

itself is fireproof throughout, being constructed of brick and Indiana limestone, of the best quality. The floors are of hard wood with a highly polished surface, and the general impression created by an inspection of the building and its interior, is at once both cheerful and artistic. A large basement has been provided for general storage purpose, and which incidentally serves as a general utility room. The first floor front, is devoted to the general offices, which are fitted up in a first-class manner, to suit the business requirements of the company.

To the rear of the offices are located the main distributing and intermediate frames, which are illustrated in Fig. 4, and the power plant and wire chief's quarters, which are shown in detail in Fig. 2.

As this department is one of the most important in connection with a telephone system, every precaution has been taken to provide for the quickest and most efficient tests with the highest grade of apparatus necessary for this class of work. Attention is called to the arrangement of the power plant which in certain respects in its installation presents some features which are worthy of second consideration. The point to which we call

be obtained is by the cordial co-operation of employer and employees.

McKeesport is situated southeast of Pittsburg and is the center of the mining and coal industry of that part of Pennsylvania. It has a population of about 40,000 which is rapidly increasing. The Bell company which operated in this town for more than 15 years, was unable to secure more than 600 subscribers, whilst the Pittsburg and Allegheny Company within three weeks, secured over 900 subscribers. This is but another illustration of the now familiar situation which is constantly presenting itself where an Independent company has secured a franchise and presented the right sort of service to the patient and long suffering public.

In anticipation of this remarkable demonstration as to the need of an Independent system, the Pittsburg and Alleghany company has made ample provision for the possible growth in the near future of this exceedingly fertile field.

It has constructed more than four miles of underground conduit containing over 150,000 feet of duct, terminating in large and roomy manholes. The smallest cable leaving the office contains 400 pairs of wires. Outside of the underground district, the town

Fig. 3. Exchange Building.

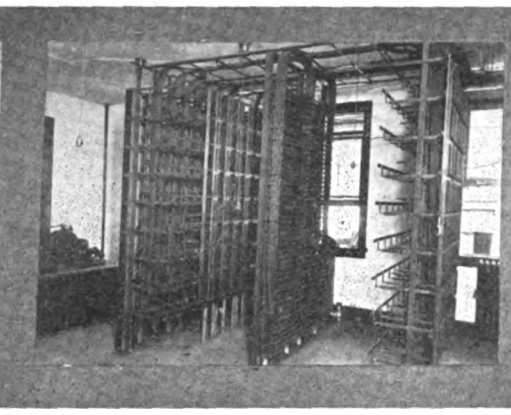

Fig. 4. Main and Intermediate Frames.

Fig. 5. Dining Room.

particular attention is the accessibility of the various machines to ready handling and inspection. Frequently, power plants are installed without any respect to their subsequent operation other than the supposition that when once installed they should run without further adjustment, consequently they are apt to be placed in some dark corner where it is difficult to make repairs rapidly when necessary. Another consideration is that when installed under such unfavorable conditions, they are not liable to receive the amount of attention necessary, consequently the rate of deterioration due to accumulations of dust and oil upon the various parts, is necessarily much more rapid than when placed where they are easy of access and in full daylight.

The storage batteries are placed in the same room but partitioned off in such a manner as to effectually prevent the fumes which constantly arise from the cells to reach any of the delicate mechanism in their neighborhood. Special provision in this respect, has been made for a thorough ventilation of the cabinet in which the cells are installed.

The main switchboard and long distance toll board are installed in the front of the building on the second floor, see Fig. 1, while five rooms in the rear of the second story are for the exclusive use of the operators. These include a recreation room, Fig. 5, dining room, retiring room, toilet room, and lockers.

It seems in this instance that the problem of social economics is receiving the attention that should be expected in a large modern exchange. The time saved and the additional work obtained from employees by liberally providing for their welfare in the way of noon lunches and recreation, assume the practical character of an investment, the returns from which are greater in many respects than an equivalent investment could produce in any other department of a telephone system. First class service is the sure road to dividends, and the only way in which it can

has been completely poled with heavy chestnut poles. The cables terminate in special can-type terminals designed by the company and constructed by F. B. Cook, of Chicago, which contain fuses, arresters and ground plates.

Practically all the company's business in McKeesport will be conducted on the measured service basis; five cents being charged for local calls. The company has just commenced to give service and is now installing telephones at the rate of 50 a day. These subscribers are put in immediate communication with approximately 15,000 telephones, connected with the other 23 exchanges of the P. & A. company in Allegheny County, and with every other Independent exchange from Toledo, O., on the west, to Erie, Pa., on the north, Altoona, Pa., on the east, and Cumberland, Md., Waynesburg, Pa., and Wheeling, W. Va., on the south, aggregating approximately 200,000 telephones.

This exchange in the opinion of telephone experts, is pronounced to be equal to any in its completeness and convenience. It has been built under the personal direction of J. G. Splane, president, and Sidney Hand Browne, vice-president and general manager of the Pittsburg & Allegheny Telephone Co.

The citizens of McKeesport have every reason to be proud of the energy and enterprise displayed by the able president and officers of the Independent company. That they appreciate the immense advantages to be gained by this refreshing change from the overpowering and unprogressive policy of the Bell company to the liberality and fair dealing of the Pittsburg & Allegheny company, is obvious from the rapid rate at which contracts were signed by all the business houses in the city.

The extensive toll system of the company, which radiates in every direction, places the patrons of the McKeesport exchange in direct touch with all the Independent systems in the States of Pennsylvania, Ohio, and Indiana.

AN INNOVATION IN EXCHANGE MANAGEMENT

THE telephone has long since been recognized as an indispensable element of business life, but the rapidity with which its use in the home has developed has brought it to the front as an invention of the greatest domestic importance, as well. Therefore, it is with the greatest gratification that we hear of the demonstration given by the public when the Toledo Home Telephone Company sent out invitations to a reception given at its exchange; an invitation which included all the people of Toledo and which was so well attended that accommodations were tested to their utmost by an interested and enthusiastic crowd of visitors. The buildings was laid wide open, and from ten in the morning until nine at night for two consecutive days demonstrators and guides were busily employed showing the people the inner mysteries of a telephone exchange.

There is one fact to be noted about the American public and that is the remarkable interest it takes in all engineering and scientific demonstrations, and on the occasion of this reception it fully bore out this reputation.

The average visitors may have gone away from the company's well appointed offices with a rather confused idea of cables, and currents, switchboards, plugs, receivers, storage batteries and connections, but he will have for some time a lively recollection of the uniform courtesy of the employees, their painstaking efforts to explain things and the business-like air which prevailed, in spite of the fact that "company" was there in swarms.

The Home switchboard is one of the best in the country. At the busy time, 75 operators are required to handle the business. They have a 15-minute rest, morning and afternoon, in addition to the luncheon hour at noon, working nine hours a day in all.

Every visitor at the exchange received a copy of an attractive little booklet, prepared by Mr. Hamblin and Mr. Stinson, in which the purpose of the public reception is very cleverly outlined. This little book, "Let's Talk it Over," gives some rather startling figures concerning the amount of business handled by the exchange. One astonishing item is the fact that the information operator handles every day the enormous average of 20,000 calls. These calls are the result of changed addresses, new telephones installed that do not appear in the directory, similarity of names and similar trifling details which tend to confuse the subscriber. The average day's total number of calls handled in the office is something like 152,000, and these 152,000 calls are largely congested into eight hours or less.

As an illustration of the immense value of system in a case where chaos would result unless intelligence and method always prevailed, the great switchboard of a modern telephone exchange is the most remarkable example on record. To the general public the comparative silence of the operating room is a source of never ceasing wonder.

In Messrs. Hamblin and Stinson's booklet they remark as follows: "The strongest impression you will receive when visiting our operating room, is the entire absence of clatter and noise. Think of one hundred girls all talking at once, but in such soft tones that the volume of their united voices does not produce a sound that can be heard two feet away."

The Toledo Home Telephone Company's switchboard is of the most up-to-date construction in the United States, and represents a marvel of efficiency and completeness. The present capacity of the switchboard is 12,500 lines and the number of lines in actual use amount to 7,000. A great dead of data can be supplied with reference to this switchboard and its equipment, but the salient facts are well represented by the following figures: The number of "Multiple Jacks" is 182,000 and "Answering Jacks" 7,500. There are 1,950 "Trunk Jacks." The total number of "Spring Jacks" therefore reach the interesting figure of 191,000. The number of underground wires reach a total of 19,600.

The Toledo Home Telephone Company is not in any sense a philanthropic institution, but the management believes firmly and heartily in the value of pleasant surroundings and considerate treatment for its employees. They take no credit whatever for the little conveniences with which their working force is provided. It is purely a matter of getting the best possible service from every one in their employ. The operators' dining-room on the second floor; the complete little kitchen, where warm food is prepared; the pleasant little lounging-room with its cheerful appointments; the perfect toilet arrangements and cloak-room accommodations—all these unusual features are of as much value to them as to their employees. They inspire the working staff with confidence in the fair intentions of the company; make the labors of the day lighter and brighter; and secure for them that higher quality of service which seems to be in all cases the natural outcome of such a policy. Perhaps, during the pressure of eight hours' labor, involving the handling of over 150,000 calls, the temporary relief, during the day, is the influence which makes work pleasant and patience a permanent characteristic.

The Toledo Home Telephone Company represents a capitalization of $2,500,000. Its inception is primarily due to the continued irritation and dissatisfaction experienced by the business men of Toledo, on account of the unsatisfactory telephone service they had received until the year 1901. The Central Construction Co. were the originators of the idea and carried out the entire process of organization, construction and operation. The name of Mr. Edward L. Barbour in connection with this company, as well as James S. Bailey, Jr., indicate the energy, determination and ability which led to the practical development of this great Independent concern in the field of Independent telephony.

W. W. DEAN GAINS LEGAL VICTORY.

SINCE the sale of a majority of the stock in the Kellogg Switchboard and Supply Company to Western Electric and Bell interests, the policy of the company in regard to patents and litigation has undergone a change. As a result of that change it became known that suits would be brought against Independent companies "right and left." The announcement of the sale somewhat spoiled this plan, but it is evident that the suits have only been postponed.

As an evidence that the policy still remains the same, we have the recent suit against the Dean Electric Company, William W. Dean and his associates. In April, counsel for the Kellogg Company went before Judge Thompson, of the United States District Court, in Cincinnati, and succeeded in obtaining a temporary order restraining Mr. Dean from executing assignments to the other defendants named, and them from accepting such assignments. The order was made returnable before Judge Wing, at Cleveland, and continued in force until July 6th, when arguments were heard by Judge Wing on the Kellogg Company's motion for an injunction to continue the restraint during the pendancy of the suit.

Judge R. S. Taylor appeared for the Kellogg Company, and Judge W. W. Boynton and Mr. Edward E. Clement for Mr. Dean.

The most flattering testimonials to the quality of work expected from the Dean Company were given. It was asked not only that Mr. Dean be restrained from working for the Dean Company, but that he be forced to go back to work for the Kellogg Company under an old contract which they set up.

Judge Wing refused the injunction. He reviewed the contract set up (which is similar to many contracts between companies and their employees), and dwelt upon the provision requiring Mr. Dean to submit any inventions he might make to the Kellogg Company, to be accepted or rejected as the company might decide. The judge held that there was a complete absence of mutuality in the contract, there being no means by which the employee could force the company to accept his inventions or continue to employ him, in spite of the fact that the aid of the court was invoked against him. It was also mentioned that no court of equity would enforce specific performance of a contract for personal service.

QUERIES

Questions on any subject relating to telephony will be answered on this page.

McINTIRE SLEEVES v. W. U. JOINTS.—(399.)

Will you please inform me what advantages there are, if any, in the use of McIntyre sleeves instead of Western Union joints. G. A.

The object of McIntire sleeves is to secure a joint which shall realize as nearly as possible the full strength of the wire; which shall be cheaper and easier to make than the so-called Western Union splice, and which can be used upon hard drawn wire without the objectionable features of so sharply twisted wire as is necessary with the Western Union splice. Also to secure as great conductivity as is obtained with the latter joint when it is soldered, without subjecting the wire to the injurious annealing action of a blow lamp.

ROCK ANCHOR.—(400.)

Is there any particular method advocteed for fastening a guy anchor to rock? S. S.

In Fig. 400 is illustrated the method usually employed. A hole is drilled in the rock at about the angle shown and just large

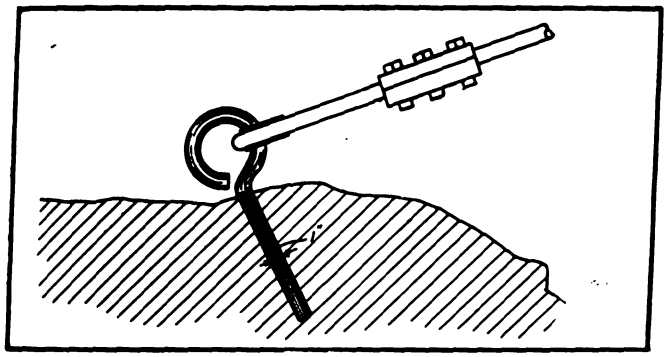

Fig. 400.

enough to allow an eye bolt 1 inch in diameter and about 18 inches long to be driven in and to fit tightly. This is as good a method as we know of.

BI-METALLIC WIRE.—(401.)

Kindly explain what is meant by bi-metallic wire. What is it used for and is it superior to copper? R. B.

Bi-Metallic wire is the trade name for a species of wire which is made by coating a small sized steel wire with a layer of copper. Primarily, the object of this device is to secure a wire which shall have great tensile strength, and at the same time high electrical conductivity. The requisite tensile strength is secured by the steel core, while the electrical conductivity is attained by the copper sheath. Unquestionably this combination affords a higher tensile strength conjoined with better conductivity than can be obtained by either steel or copper alone.

Theoretically, for telephone purposes, if a wire could be made with a copper core and an iron sheath, it ought to give slightly better results in transmission. It is, however, probable, that in ordinary practical work such improvement would not be greatly noticed.

As bi-metallic wire costs more than either iron or copper, it has not come into wide use, excepting in cases where it is necessary to swing long single spans as in the crossing of rivers, etc.

HARD AND SOFT DRAWN COPPER WIRE.—(402.)

What are the electrical and mechanical advantages of soft and hard drawn copper wire, also what precautions, if any, have to be used in construction? U. Tel. Co.

Wire of all descriptions is manufactured by rolling the metal of which the wire is to be composed into rods about ½-inch in diameter. Then the so-called "wire rods" are pulled through a die which consists of a plate of hardened steel having a hole drilled in it, slightly smaller than the rod. When the rod is pulled through the die, the metal is compressed and elongated and at the same time the rod is reduced in diameter. By pulling the wire through one die after another, each having a slightly smaller hole, the wire can be reduced in diameter to almost any desired degree. The operation of this process of drawing is to create on the surface of the wire a kind of a skin which is exceedingly hard and strong. This effect is somewhat similar to that produced by tempering in the case of steel. Hard drawn wire therefore possesses considerably greater tensile strength, usually two or three times that of soft metal, but on the other hand its electrical conductivity is reduced from 3 to 4 per cent. The advantage gained in extra tensile strength is so much greater that it is cheaper to use hard drawn wire of slightly larger size to compensate for the decreased conductivity. As the increased strength is due to hard skin formed on the surface of the wire, great pains should be taken not to injure this surface by nicking or cutting, or sharply bending the wire, and it is equally important to avoid soldering or any other operation which shall heat the wire, and thus destroy the continuity of its surface.

ANTI-SIDE TONE.—(403.)

Will you please explain what is meant by an "anti side tone" circuit? P. L.

It is often desirable to use powerful and sensitive transmitters, particularly over long toll lines. A receiver placed close to such a transmitter (the one in the user's circuit) will usually be afflicted with an abominable "side tone." The method of the accompanying illustration Fig. 403, may be used to mitigate this evil. The induction coil is wound in four parts, *a a'* being the primary and *b b'* the secondary; *a a'* are placed in parallel, and in series with the battery, transmitter, and impedance coil *c*, while a condenser is in bridge. The secondary is in series with

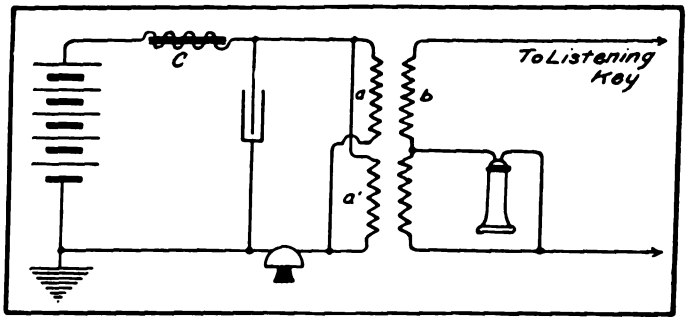

Fig. 403.

the toll line, the receiver being placed in parallel with half of the winding. Evidently the transmitter is in a low resistance local circuit, while the effect of all the windings of both coils of the primary is impressed on the secondary circuit. In the secondary circuit the coils are in series, hence there is the greatest possible step-up effect from the induction coil. The receiver only gets half the voltage of the induction coil, while the toll line receives it all. If the receiver is high wound it will have but a slight shunting effect on the toll line, and as its circuit is but a fraction of the induction coil, secondary, the side tone is much reduced. Obviously the expedient can be extended to reduce side tone to any desired extent.

SOLDERING SOLUTION.—(404.)

Can you give me a formula for or the name of some good soldering solution for soldering galvanized wire joints? E. F. B.

Take a wide necked, 6 oz. bottle, and pour in about 2 or 3 ounces of hydrochloric acid. Drop into the bottle a dozen or two small pieces of zinc, preferably granulated and wait until all ebullition ceases. This solution is about the best for general soldering and you will probably find it satisfactory. There are many kinds of soldering sticks sold by electrical supply companies, which are convenient to use. In using either the solution or stick flux, apply the heat to the middle of the joint, as the solder must run there first to obtain strength and solidity. Too much heat will anneal the wire and weaken the line. Wipe the joint free of all acid after soldering, or corrosion will follow.

TELEPHONE CONVERSATION AS EVIDENCE.

THE action of the Supreme Court of Massachusetts regarding the admission of telephone conversations as evidence is not only interesting from a legal point of view, but it marks conspicuously the present status of the telephone as a social factor. In the case in court the question was raised of whether a witness could properly testify to what he heard plaintiff say as part of an alleged conversation with the defendant over the telephone, the parties to the conversation being miles apart. The Court held that the evidence was admissible.

It would be difficult to cite a better illustration to show how completely the telephone has become an integral part of the social life of the country. It must be reckoned with, hereafter, not only as a helpful and ingenious device for annihilating time and space, but as a great social force on which the future development of the race largely depends.

The President, who from the retirement of his country home many miles away, may at any moment talk over long distance wires with the heads of departments in Washington, is practically in Washington and at his office every day. He is present and absent at the same time, contrary to all of the deductions of science and to the famous ruling of Speaker Reed. Yet, so closely has the telephone been woven into our social fabric, this astounding fact passes without notice or, at most, more than a passing thought. The merchant who keeps in touch with his trade and his market by means of the telephone; the housewife who has the entire business community at her command, through a hole in the wall, and who can talk with her friends without leaving the room, even if they live in another State, do not stop to reflect that they are utilizing an invention as revolutionary as was the railroad itself. The visitor at the Louisiana Purchase Exposition, who looks with interest at the enormous display of telephone apparatus, and sees without wonder the important part which the telephone plays in this great exposition, rarely stops to reflect that the first telephone exhibit ever made was at the famous Centennial exposition at Philadelphia, less than thirty years ago, and that then the telephone was regarded more as an interesting scientific toy than as a practical device destined to revolutionize the commercial life of the world in less than a quarter of a century.

Decisions like that of the Massachusetts Supreme Court and exhibits like those at St. Louis have an additional and unintentional value, in that they arrest the attention for a moment and confront us with the greatest miracle which has been wrought in modern times. The beginnings of telephony were necessarily slow; that is, slow relatively. In the nature of things this would be true, and it was particularly true in this case because the patents passed into the control of a grasping monopoly which failed to appreciate the tremendous future of the telephone as a commercial proposition. The present rapidity of movement which characterizes the progress of telephony dates from the expiration of these primary patents and the subsequent revolt from Bell rule, which revolt found expression in Independent telephony. Since then, progress has been rapid enough to suit all except the remnants of this once all-powerful monopoly.

It is easy enough now to look back and see that the Bell people might have avoided all competition by pursuing a different policy; just as in the light of ten years' experience we now wonder at the attitude of the Bell companies, who, until the Independents pointed the way, seemed to do all in their power to discourage the use of the telephone in the country. These things have passed. The monopoly took the wrong course to avoid competition, and Independent telephony became a great and growing fact, with no interest in the Bell companies except to avoid their mistakes.

THE TELEPHONE INDISPENSABLE IN RURAL DISTRICTS.

It is pleasing to those who are interested in the development of Independent telephony to note how well have two great mistakes been avoided. As the birth of competition was due to the unsatisfactory service of Bell companies, it was natural that Independents should take from the start as their watchword, "good service." They believed that a proper regard for the rights of the people and the desires of the consumer would pay in the long run. Avoiding the great and vital mistake of giving poor service, so characteristic of monopoly, the Independent companies started on that marvelous career of development, which has astonished themselves and thrown consternation into the ranks of the enemy.

But good service was not enough. Adequate service was necessary. By confining the telephone to the cities, a giant was being imprisoned and a wonderfully fertile field was being left unexploited. Therefore the Independents set about to avoid this second great mistake, and encouraged the building and development of rural lines. So successful has been this movement and so valuable have these country lines proved as "feeders" for the city systems, that even the Bell companies, where compelled to by competition, are extending their system in the country. But the praise for this movement, which is one of the most significant developments of this remarkable age, is due entirely to the Independents.

The extent of the rural lines now in operation has become so great that in the Middle West, where Independent telephony has had its greatest growth, there is hardly a town or village of any importance which is not connected with an Independent line so that intercommunication is possible. Farmers have been quick to see the advantages of the telephone, and the day will soon be here when it will be considered as necessary in the farm house as the plow and cultivator are in the field.

The possibilities in the rural telephone are endless. The latest, and an altogether unexpected, development is the use which is being made of the device by traveling salesmen for the city firms. Where once it was necessary for him to travel many miles to reach the man he was after, only, perhaps, to find that the trip was unnecessary, he now goes to the nearest telephone and has a preliminary talk with his party before making the trip.

These methods have won the day. Good service has become synonymous with Independent telephony, and Independent lines have been welcomed in every observing community, because the establishment of an Independent line has meant telephones in the farm houses and throughout the rural districts. These methods will always win, other things being equal. There is a significance in the fact that in northern Indiana, which State is one of the Independent strongholds, there are 32,575 Independent telephones in use and only 2,157 Bell instruments. This disparity did not come about by accident. It arises from causes that are fundamental.

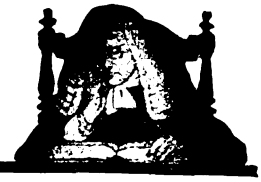
The Telephone in the Courts

Conducted by A. H. McMillan.



Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

TELEPHONE AND RAILROAD COMPANIES.

THE Supreme Court of Louisiana has rendered a decision interpreting the language of the statute giving telephone companies the right to construct their lines "along and parallel to any of the railroads in the city." The Southwestern Telephone Company brought an action to expropriate a right of way for its poles and wires on the east side of the right of way of the Kansas City, Shreveport & Gulf Railway Company, a distance of 248 miles. The plaintiff was given judgment, and the value of the right of way thus expropriated was assessed at $10 a mile. The defendant appealed from the judgment upon three grounds. Defendant contended, first, that the language quoted above did not authorize the construction of telephone lines upon the railroad. The answer to this was that the plaintiff did not propose to establish its poles and wires upon the railroad, but simply upon the right of way. Secondly, defendant contended that plaintiff's poles and wires should be established upon the west instead of the east side of defendant's track, as likely thereby to occasion less inconvenience. The wires of a telegraph company were already strung on the western side of the track, and the matter of convenience or inconvenience seemed to the court to be rather hypothetical than real. Southwestern Telephone Co. vs. Kansas City, S. & G. Ry. Co. (109 La.), 33 S., 910.

INSULATION REQUIRED AT CROSSINGS.

THE fact that there are other lines of wire above those of an electric company increases the latter's obligation of care towards the public. The later comer's fault in not guarding against accident does not excuse the company first there from taking additional precautions. This was the holding of the Supreme Court of Louisiana in Herbert v. Lake Charles Ice. Light & Waterworks Company, Limited. The defendant's wires were in place at a certain point in the city of Lake Charles when the Cumberland Telephone & Telegraph Company built its lines over those of the Lake Charles Company. The latter company alleged that the insulation was worn off its wires by the dragging of the Cumberland Company's wires across its own in the process of construction. A heavy storm came up and broke one of the Cumberland Company's wires, which fell upon one of the uninsulated wires below, causing it to burn through and fall upon the street, where a pedestrian coming in contact with it was killed. The widow of the deceased sued the Lake Charles Company for damages and was given $4,000 in her own right and $4,000 as tutrix of deceased's child.

Defendant claimed that, if there was any legal liability to plaintiff by any one, it was by the Cumberland Company; that the latter company, when it erected its own poles and strung its wires, found defendant in position under legal authority, and upon it was imposed the duty of doing everything that should be necessary for the protection of life and property; that it should have strung its wires below those of defendant, or if it strung them above it should have availed itself of every instrumentality in its power to guard against the injury in this case. The court held that even if the Cumberland Company was under the duty that defendant asserted, the defendant was not hereby relieved from its own duties in the case. It should have taken steps itself to relieve the situation from danger, and not have remained inactive simply because some other company had come to have legal liabilities to the public imposed upon it. If the situation was such as would have enabled the defendant to have forced the Cumberland Company to perform the duty imposed upon it, it should have made use of its power in that direction, or, failing that, it should have applied some proper remedy itself. If the insulation was worn off its wires by the fault of the Cumberland Company, defendant should have at once repaired them, independently of the quarter from which the defect arose. If the telephone company had a duty to perform, the defendant likewise had one to perform, and, both failing, both are liable whether sued separately or together.

The defendant also contended that it should be held free from liability because the injury was the result of a storm and therefore beyond the defendant's control. This contention the court overruled since the defendant was in default as to the condition of its wires at the point where the accident took place, not only as respects extraordinary storms, but as to events likely to happen at any moment from the simplest causes. The court thought that notwithstanding the storm and notwithstanding the falling of the telephone wire, the deceased would not have been killed had defendant's wire been properly insulated.

The court considered the damages awarded as too high and reduced them to $3,000 for plaintiff herself and $3,000 for her child. Thus reduced, the judgment was sustained. Hebert v. Lake Charles Ice, Light & Waterworks Co. (111 La.), 35 S, 731.

SERVICE OF PROCESS.

SERVICE of process upon the keeper of a drug store in which is located a telephone toll station of which he has charge, is sufficient service to sustain a judgment against the telephone company; such is the holding of the Supreme Court of Georgia in a recent case. The Southern Bell Telephone & Telegraph Company had, in the town of Oglethorpe, Ga., a long distance telephone toll station, located in the drug store of Dr. Crumley, whose duty it was to collect tolls from the patrons of the company, and to give such patrons the desired connections with the telephone system which had been established in the city of Americus. The operators in charge of the exchange located in that city connected the telephone at Oglethorpe when called upon to do so by Dr. Crumley with other telephones connected with Americus and in adjacent towns.

One Roy Parker brought suit against the company, alleging that it had placed a telephone in his store for use in his business, on which he paid the usual charges. He alleged that the company neglected to attach a ground wire to the telephone, and to equip it with the necessary appliances to prevent injury from lightning, although Parker had asked to have this done. One day Parker, while standing about four feet from the telephone, was struck by a bolt of electricity, conveyed from the telephone wires to this telephone, by which he was knocked senseless to the floor, and severly injured.

Process was served upon Doctor Crumley. Judgment was afterwards taken by default against the company and the defendant moved for a new trial on the ground that Dr. Crumley had no authority to receive service. It was his duty to take care of the instrument in his store, cleaning the carbons of the lightning arrestors and changing fuses in the office, but doing nothing else; all the rest was done by a lineman from the Americus exchange. The statute of the State declared that service might "be perfected by serving any officer or agent of such corporation." The court held that while Dr. Crumley was not an officer of the company, neither was he its mere servant or employee, as commonly understood. Applying the rule that the "ordinary signification shall be applied to all words except words of art," the court held him to be an agent, and that services upon him was sufficient to justify judgment. Southern Bell Tel. & Teleg. Co. vs. Parker, (Ga.), 47 S. E. 194.

IN THE OPERATING FIELD.

DISTRICTS OF OHIO INDEPENDENT TELEPHONE ASSOCIATION.

AT the recent meeting of the Ohio Independent Telephone Association, it was decided to divide the State into nine districts, each of which is to be in charge of a vice-president of the association, who is to look after all local matters. The various districts, with the vice-presidents in charge, are as follows:

District No. 1—J. B. Hoge, vice-president, Cleveland; consists of Erie, Lorain, Cuyahoga, Huron, Medina, Lake, Geauga, Ashtabula and Trumbull counties.

District No. 2—W. F. Laubaugh, vice-president, Akron; Summit, Portage, Mahoning, Stark, Columbiana, Carroll, Jefferson, Harrison and Tuscarawas counties.

District No. 3—J. B. Rhodes, vice-president, Zanesville; Coshocton, Muskingum, Guernsey, Belmont, Noble, Monroe, Morgan, Washington, Perry, Athens, Meigs and Gallia.

District No. 4—G. P. Thorpe, vice-president, Wilmington; Pickaway, Fayette, Vinton, Jackson, Scioto, Lawrence, Pike, Adams, Highland, Clinton and Ross.

District No. 5—W. G. Thompson, vice-president, Lebanon; Butler, Warren, Hamilton, Clermont, Brown and Preble.

District No. 6—J. C. Reber, vice-president, Dayton; Greene, Montgomery, Clarke, Champaign, Logan, Shelby, Darke and Miami.

District No. 7—G. E. Matheany, vice-president, Lima; Marion, Wyandot, Hancock, Putnam, Paulding, Van Wert, Mercer, Allen, Auglaize and Hardin.

District No. 8—R. E. Hamblin, vice-president, Toledo; Williams, Fulton, Lucas, Ottawa, Sandusky, Seneca, Wood, Henry and Defiance.

District No. 9—Dwight E. Sapp, vice-president, Mt. Vernon; Crawford, Richland, Ashland, Wayne, Holmes, Morrow, Knox, Union, Delaware, Licking, Franklin, Fairfield and Hocking.

AUGUST 1, 1904.

THE ZENITH COMPANY EXPANDS.

THE Zenith Telephone Company, which operates in Duluth, Minn., is now expending between $75,000 and $100,000 in enlarging and improving its plant and adding to its capacity. When the work is complete the company will be in a position to handle 1,000 more subscribers, making the total capacity of the plant about 3,500. At present about 2,500 names are on the books as subscribers.

A crew of 100 men is employed in making the improvements in various parts of the city, establishing new lines, laying conduits, etc. A new switchboard, with a capacity of 1,000 subscribers, is being installed. A complete party line system is also being put in. In all about $10,000 is being spent in laying underground conduits, and a large number of leads are being placed in different parts of Duluth.

INDEPENDENT COMPANY ISSUES SOUVENIR.

THE Inter-State Independent Telephone company, which operates a system of exchanges in Illinois, has just issued a handsome souvenir accompanying the thirteenth regular quarterly dividend, with illustrations of the interior of exchanges at Aurora, Elgin, Springfield, Plainfield, Joliet, Sterling and the exterior of the Inter-State Building at Peoria. This exchange will be in operation by November 1. Twenty-one miles of the streets are covered by the conduit system.

The souvenir contains much useful information. At the top of the principal page is a map showing the toll lines of the Inter-State Company. In the Aurora exchange the switchboard has a capacity for 4,000 lines, and a conduit capacity of 5,500. Put in operation January 1, 1901, with 300 subscribers, the present subscribers number 1,693. The Elgin exchange has 735 subscribers at the present time. Joliet has 1,800; Springfield, which was put in operation November 1, with 1,000, has 1,745 subscribers at the present time. Plainfield has 545 and Sterling has 591. Sterling's exchange was put in operation on July 1.

SOME FIGURES FROM OHIO.

AS an indication of the strength of the Independent situation in Ohio the following figures will prove of interest: Independent companies in Ohio have over 183,000 telephones, as shown by the tax returns against the Bell company's 90,000, including Cincinnati and Cleveland. The Independents have over twice the mileage of toll line in Ohio the Bell has. They also have a very large rural development which the Bell has not. The Independents have accomplished this growth within a period of seven years.

Columbus, in two years, has reached 5,200 subscribers, and the managers of that exchange are now completing arrangements for a new automatic exchange which will accommodate 19,000 telephones, 10,000 of these to be installed immediately.

Toledo, in two years, has 7,000 telephones, while the Bell has less than 4,000.

In Champaign County the Independents have over 1,400 telephones, while the Bell has less than 100.

Darke County has over 1,100 Independent telephones, and less than 50 Bell.

Shelby County has over 1,000 Independent, and less than 200 Bell.

Logan County has over 1,200 Independent, while the Bell has nothing but toll stations. Many other counties could be named which show the same ratio of the Independent to the Bell. These are only a few instances which show only too plainly the immense headway that is being made by the Independent telephone companies.

AS IT IS ON THE OTHER SIDE.

ONE of the officials of the National Telephone Company, of London, has recently been telling his troubles to an unsympathetic world. His plaint reaches nearer home the hearts of telephone men, who know what it is to bear burdens of the same sort in America. In England, it appears that right-of way—or, as they call it over there, "way-leave"—furnishes the greatest amount of trouble. The average Britisher is very intent upon maintaining what he considers his rights, and the extent of his ardor in this direction sometimes leads to peculiar complications. A land owner, outside of London, suggested, once, that in exchange for the privilege of putting up poles, the National Telephone Company should build him a house. In another case the owner asked £300 a year for permitting the erection of a standard on his roof.

"Matters of this sort," the National man is quoted as saying, "may be obviated by a little judicious jollying, or even by changing the rout of the line, but the bull-dog prejudice that we run against occasionally is hard to get around. Recently a well-known and influential London attorney stated that whenever possible he would prevent the telephone service from spreading. As he is

Digitized by Google

the owner of a large block of realty in a section of the city, he has succeeded in keeping us practically out of that neighborhood."

"Some of the objections made to us," continued the telephone official, "are almost incredible and one hesitates to repeat them, for fear of misbelief on the part of hearers. Two women at one time ordered the removal of wires passing over their garden, alleging that their nephew, who they suspected had designs on their property, had sent ghost messages over the wires and that the messages reverberated through the house. At another time the owners of a poultry farm declared that after the wires were laid across the top of the house the hens laid fewer eggs. An angry owner once tied a group of our wires to a dog kennel containing a ferocious hound and then invited our men to remove the leads.

"Telephone men, of course, are frequently threatened with shotguns. Sometimes they take risks and sometimes they don't; it depends a good deal upon the nerve of the telephone man, but also upon what he thinks the property owner will do. If the latter has the reputation of being a pugnacious fellow, ready to assert his claims on all occasions, the wireman usually takes the better part of valor and leaves the property. On one occasion a way-leave official got out of a fix in a decidedly original manner. The owner had threatened to kick him out of the place. The telephone man inquired whether he might have the way-leave after he had received the kicking. The owner assented, but on the way-leave man's preparing for the kicking the property holder's sense of humor was touched and he granted the right-of-way without further demur.

ETIQUETTE OF THE TELEPHONE.

DOUBTLESS there is not a business man in the city who has not had occasion many times to call the attention of some of his clerks to the fact that each person who rings up on the office telephone is not a personal enemy. The ordinary office clerk who responds to a telephone call takes on a tone of voice as though he were answering under protest. He is surly, sharp and disagreeable—at least that's the way it sounds. It is to overcome this difficulty that a little card, attractively printed and without an advertisement on it, is now being hung close by the telephone in many offices. It tells how a telephone call should be responded to. We are indebted to Frank A. Burrelle, of Bureau Clipping fame, for this original and instructive monograph, whose influence we believe is certain to be far-reaching.

When Using This Telephone

REMEMBER that a stranger is at the other end of the line.

REMEMBER that the tone of your voice may make him a customer or drive him away.

MAKE a customer of him and you increase your usefulness to this office.

THEREFORE, when using this telephone always be polite, agreeable, accommodating and patient.

ACT, when you answer a call, as though it were the only bit of work you are called upon to do all day, and do it in an absolutely perfect manner.

AN INDEPENDENT COMPANY FOR OMAHA.

APPLICATION for a twenty-five year telephone fanchise has been made to the city council by the law firm of Blackburn & Spurlock, representing the Interstate Telephone Company of Dubuque, Ia. No ordinance was presented, but in a general way the proposition to be made was set forth in the communication, which was referred to the committee of the whole.

The seekers of the franchise guarantee a system with not less than 2,500 subscribers, promise a $3 monthly rate for business telephones and $1.75 for residences on individual lines, equipped with copper metallic circuits, and offer the city a royalty annually of 3 per cent. upon the gross receipts.

According to the attorneys the Iowa and Minnesota capitalists, headed by Victor Stevens, of Dubuque, who desire the Omaha franchise, are builders and not merely promoters, and have constructed numerous successful lines in Iowa, Illinois and Minnesota, all of which are satisfactory and which they still own. Work will be started within three months if an Omaha franchise is secured. The company is willing to go under bond and not to sell out to any other local concern and to protect the city in various ways, and also to deposit cash to compensate the city for the restoration of paving or other damage.

Wires in a district bounded by Twenty-eight, Clark and Leavenworth streets are to be underground, pole connections to be allowed inside individual blocks, however. Notice is given that the formal application for a franchise to use the streets and alleys will be presented and a willingness is expressed to abide by all the regulations the city may choose to make.

Mr. Blackburn states that the lines of the company extend across Iowa almost to Council Bluffs and that a franchise will be asked for in that city, and through connections made, provided the Omaha franchise is obtained.

INDEPENDENT MUNICIPAL TELEPONES

THE Board of Awards of the City of Baltimore, Md., has recently given the contract to the Maryland Telephone and Telegraph Company for the municipal telephone exchange from August 1, 1904, to July 31, 1907.

Bids were received from both the Maryland and the Chesapeake and Potomac Telephone companies. The latter company submitted four propositions, two based upon furnishing its own private exchange and the other two upon utilizing the present Maryland Exchange in the City Hall, but substituting its own paraphernalia. On the direct comparison between each company's bid to furnish its own exchange, with 15 trunk lines and 117 stations, at $8 each, the figures were:

Maryland:
Trunk lines and 25,000 calls a year.....$1,225
Chesapeake:
Trunk lines and 25,000 calls.....$1,410

Both bids were made with the underetanding that the city furnish operators, and annexing this cost of $2,250 per annum to each bid, together with $936 for 117 stations at $8 each, the total cost of each exchange would net: Maryland, $4,406; Chesapeake, $4,596, a difference of $190 in favor of the Maryland, this difference being due to the latter company charging 2 cents a call, while the Chesapeake asked 3 cents. This charge is for calls made to points outside of the municipal exchange, all calls between city departments to be free.

HUNTINGTON INTERESTS IN THE SOUTHWEST.

THE Huntington syndicate of California is rapidly carrying out its plans to establish a thorough long-distance telephone line between the Atlantic and Pacific coasts. This syndicate acquired important Independent long-distance lines in Texas several months ago, and is operating them in connection with local Independent exchanges. These Independent lines extend into Louisiana, and it is planned to extend them east to New Orleans and points on the Atlantic seaboard. The syndicate has recently acquired long-distance lines in New Mexico and Arizona, and these will be operated in connection with its existing lines in California. A gap of 600 miles between El Paso and San Antonio will have to be built, and this work will be started on in the near future.

CENTRAL ILL. ASSOCIATION ORGANIZED.

PRELIMINARY plans to organize the Central Illinois Independent Telephone Association, to include every central Illinois Independent telephone company, were made in Bloomington, Ill., recently. Albert Schuler, of Streator, was chairman of the meeting, and R. C. Critchfield, of Minier secretary. A committee was appointed to outline permanent organization plans.

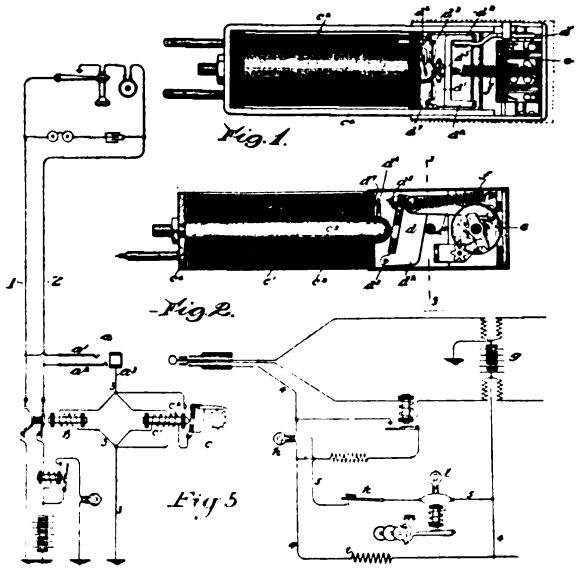
TELEPHONE PATENTS

CALL METER.

C. E. Scribner, of Chicago, Ill., and F. R. McBerty, of Evanston, Ill., patent (No. 765,255) and assign to the Western Electric Company, of Chicago, Ill., a call meter for telephone exchanges. The object of this invention is to produce an improved register



for indicating the number of calls which each substation makes. A detail of the apparatus is shown in Figs. 1 and 2. From which it will be seen to consist of an electromagnet having two windings, c^1 and c^2. The electromagnet actuates an armature, d^2, which is attached to an accounting mechanism similar to that of an ordinary cyclometer. The circuit is shown in Fig. 5, from which it will be seen that one winding of the meter c^1 is placed in parallel with the cut-off relay b, while the second winding c^2 forms a shunt around the first winding. After the operator has inserted the plug and obtained the desired party she presses the key k. This operates the register, and, at the same time, causes the signal lamp t to glow, or the counter m to register. This latter device is so arranged as to notify the chief operator that the proper registration has been made.

COMBINED SPRING JACK.

J. L. Kise, of Wellington, Kans., patents (No. 765,183) an improved spring jack. This spring jack is designed chiefly for telegraphic work, though it may be used in telephony. It consists of a base plate carrying two springs, one placed in the groove in which the plug is inserted. The other spring is placed upon the space outside of the first spring and when the plug is inserted the first spring is brought into contact with the second.

SELECTIVE SIGNALLING APPARATUS.

J. J. Comer, of Parkridge, Ill., patents (No. 765,413) an improved device for party line selective signalling. The gist of Mr. Comer's invention consists in providing each substation with a kind of an electric motor whose armature can be rotated either right-handedly or left-handedly, depending upon whether the operator sends positive or negative current over the line. By means of the rotation of the armature in either direction at pleasure a contact mechanism is operated whereby any station may be selected.

MESSAGE COUNTER.

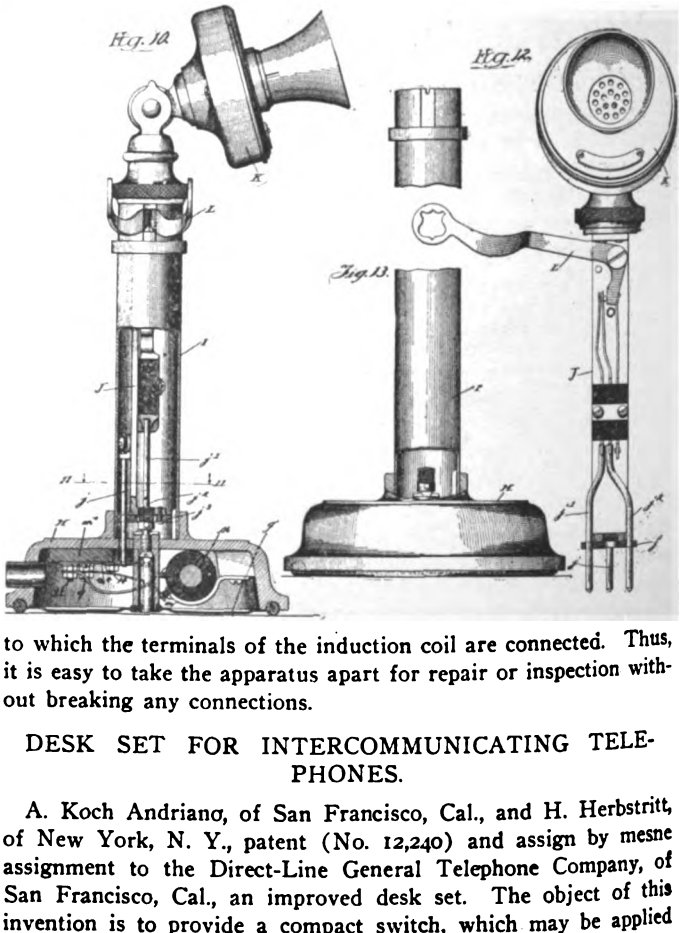
H. D. Stroud, of Chicago, Ill., patents (No. 764,963) and assigns to the National Measured Service Company, of Chicago, Ill. The object of this invention is to provide a message counter which shall be placed in the subscriber's substation, and which is actuated by the subscriber whenever a call is made and, yet, at the same time, the operator is enabled to cancel the registration in case the desired party cannot be obtained. The inventor provides a device similar to a cyclometer, so attached to the hook-switch that the use of the telephone shall cause the number dials to rotate. He further provides an electromagnet, which is under the control of the operator, and so arranged that if the party cannot be obtained the operator can cancel the registration which the subscriber has previously made.

ELECTRICAL MEASURING INSTRUMENT.

A. A. Kent, of Philadelphia, Pa., patents (No. 764,814). The object of this invention is to provide an improved instrument which can be used either as a voltmeter or an ammeter. The device contains a pivoted indicating needle attached to a magnet placed in a magnetic field, which is created by the current it is proposed to measure. This magnetic field is produced by a magnet which has two windings, one of coarse and one of fine wire. The circuit of these windings is controlled by a spring, and thus by cutting in the fine wire the instrument may be used as a voltmeter, and if the coarse wire is employed it becomes an ammeter.

TELEPHONE DESK SET.

P. C. Burns, of Chicago, Ill., patents (No. 765,064) and assigns to the American Electric Telephone Company, of Chicago, a telephone desk set. This invention relates to an improved desk set, which is illustrated in Figs. 10, 12 and 13, from which it will be seen that the induction coil is placed in the base of the set, the switchhook and contact springs being carried in the post. From the contact springs connections are made through the pins j, j', j^2 and j^3, which are arranged to impinge upon springs (see Fig. 12),



to which the terminals of the induction coil are connected. Thus, it is easy to take the apparatus apart for repair or inspection without breaking any connections.

DESK SET FOR INTERCOMMUNICATING TELEPHONES.

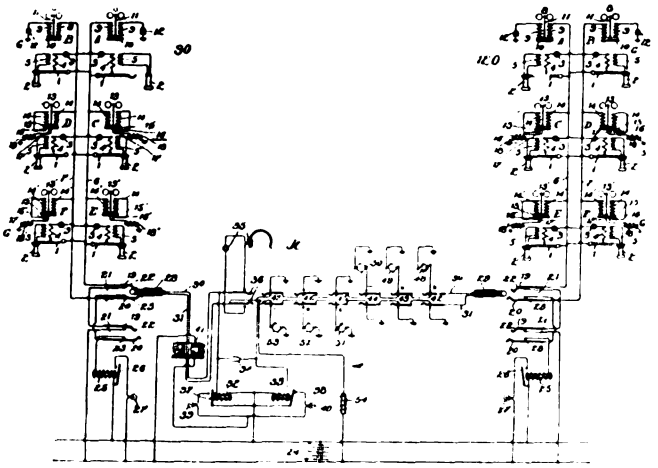
A. Koch Andriano, of San Francisco, Cal., and H. Herbstritt, of New York, N. Y., patent (No. 12,240) and assign by mesne assignment to the Direct-Line General Telephone Company, of San Francisco, Cal., an improved desk set. The object of this invention is to provide a compact switch, which may be applied to desk sets used for intercommunicating telephones. The in-

Digitized by Google

ventor provides a series of contacts placed in the pedestal of the telephone and so designs the pillar which supports the transmitter that it may be rotated and by this means carry a contact spring over the various contacts provided. Locking mechanism is arranged somewhat after the plan of several other well-known intercommunicating systems.

SELECTIVE SIGNALLING SYSTEM.

W. M. Davis, of Chicago, Ill., patents (No. 765,461) and assigns to the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y. The object of this invention is to provide a system for the selective signalling of party lines. In



essence this invention consists in so arranging the various substation instruments that one may be responsive to alternating current, another to direct current positive, and another to direct current negative, etc., as shown in the illustration. Each operator is provided with a set of ringing keys containing as many keys as there are different kinds of current. Consequently, the manipulation of any one key will select a particular station.

TRANSMITTER.

W. Kaisling, of Chicago, Ill., patents (No. 765,488) and assigns to the Stromberg-Carlson Telephone Mfg. Company, of Rochester, N. Y., an improved telephone transmitter. The object of this invention is to provide an improved telephone transmitter which the inventor accomplishes, as is shown in the illustrations, Figs. 2 and 4. The peculiarity of this transmitter lies in the fact that the electrodes are composed of four metallic studs, *39*, which

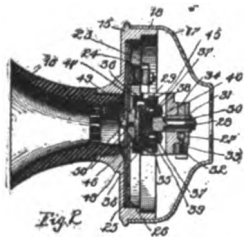


Fig. 2.

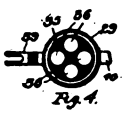

Fig. 4.

are placed inside of corresponding holes shown in the carbon disc in Fig. 4. One pair of these metal studs is connected to one pole of the battery and the other pair to the other pole. In front of these metallic studs the front electrode is placed and connected to the diaphragm, as shown in Fig. 2. There is, therefore, a path for the current from one pair of studs through the granular carbon and then to the other pair of studs. The vibrations of the diaphragm cause variations in the pressure of the granular carbon, which result in the transmission of speech.

CORDLESS SWITCHBOARD.

I. Kitsee, of Philadelphia, Pa., patents (No. 765,142). This patent is a divided application of a patent already granted to the same inventor for the same purpose and previously noticed in our columns. It relates to a device to take the place of the ordinary cords upon the telephone switchboard. The details embraced in the present patent are modifications of a previous patent granted to the same inventor. The device is so complicated as to require a longer description than space will permit and the reader is referred to the description of the patent printed in a previous issue.

PLUG SWITCH.

W. Kaisling, of Chicago, Ill., patents (No. 765,489) a plug switch and assigns to the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y. The object of this invention is to provide an improved telephonic switch, as shown in the accompanying illustration. The inventor provides sets of

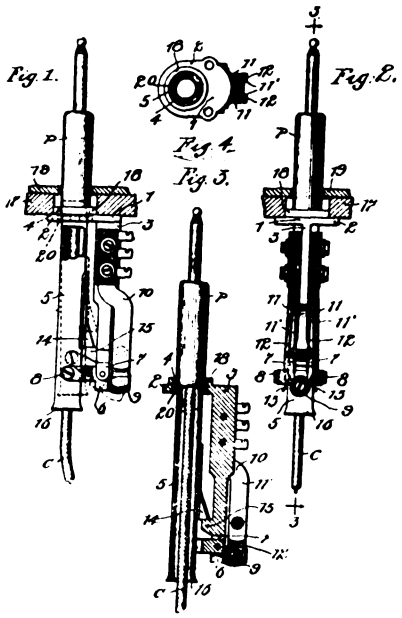

Fig. 1. Fig. 4. Fig. 3. Fig. 2.

springs, *10* and *11*, to which the circuit wires are attached. These springs are operated by an insulating roller, *9*, which is secured to a fork lever, *6*, which is attached to a movable tube, *5*, which rises and falls with the position of the plug. The whole contrivance is attached to the under side of the cord shelf by means of the plate *2*.

TELEPHONE TRANSMITTER.

R. Hansen, of Chicago, Ill., patents (No. 765,480) and assigns by mesne assignment to Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., a telephone transmitter. The object of this invention is to provide an improved battery transmitter. The inventor uses a diaphragm, *e*, to which the electrode *m* is attached by means of a screw, *n*, and nut *n2*. To

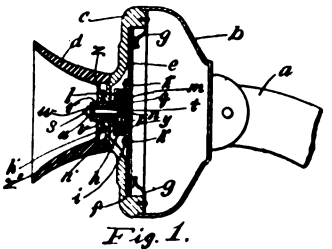

Fig. 1.

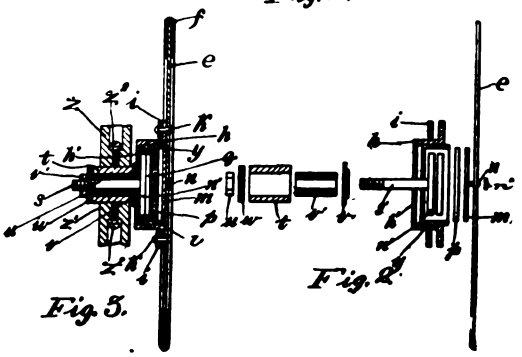

Fig. 3. Fig. 2.

this electrode a carbon disc, *p*, is soldered. There is a capsule, *h*, which is riveted to the diaphragm, as shown in Fig. 3. This capsule carries an interior cup, *y*, which contains the rear electrode *s'*, to which the carbon base plate *n* is soldered. Granular carbon is placed between the electrodes.

Digitized by Google

THE WEEK'S MESSAGES

FINANCIAL.

CHICAGO, ILL.—United States Telephone, the long distance Independent company, reports for the five months ended May 31: Gross earnings, $169,487; operating expenses and taxes, $99,865; net earnings, $69,622; charges, $41,671; surplus, $27,951.

AUGUSTA, ME.—The China Telephone Company, organized at South China, has filed a certificate at the office of the Secretary of State. The purposes of the corporation are to establish, construct, equip, maintain and operate telephone lines. The capital stock is $10,000, of which nothing is paid in. The par value of a share is $10. W. J. Thompson, of South China, is president, and Fred B. Foye, of China, is treasurer.

BALTIMORE, MD.—It is understood that the refinancing of the Maryland Telephone and Telegraph Company will not take place until after Mr. George R. Webb returns from a trip abroad. The present capitalization of the Maryland Telephone and Telegraph Company consists of $1,000,000 5 per cent. first mortgage bonds, $1,155,000 outstanding of an authorized issue of $4,000,000 of second mortgage 5 per cent. bonds, and $1,000,000 of common stock.

PALO, MICH.—The Palo Telephone Company has increased its capital stock from $6,000 to $10,000.

HUTCHINSON, MINN.—The Hutchinson Telephone Exchange Company filed an amendment increasing its capital stock from $25,000 to $50,000.

BUFFALO, N. Y.—A mortgage for $500,000 given by the Union Telephone Company of Buffalo to the Knickerbocker Trust Company of New York City, has been filed with the county clerk. The mortgage covers all the property of the company.

GUTHRIE, OKLA.—The assessed value of telephone properties in Oklahoma, as shown in the auditor's office, $166,662, a gain of $42,390 over 1903. The increase last year was $35,066.

DAYTON, O.—The stockholders of the Home Telephone Company, of Dayton, have been notified of a special meeting to be held August 12th for the purpose of voting on an increase of $200,000 in the capital stock of the company. The new issue will be preferred stock.

CANADIAN, TEX.—The Stockmen's Telephone Company, of Canadian, has increased its capital stock from $2,500 to $5,000.

FRANCHISES.

JACKSONVILLE, ILL.—The Illinois Telephone Company, of Jacksonville, has increased its capital stock from $100,000 to $500,000.

ELKTON, MD.—The Cecil Farmers' Telephone Company, at a recent meeting of the county commissioners, held in Elkton, was granted a franchise to construct lines on the public roads in Cecil County. The company has a capital stock of $2,500 and was incorporated recently.

CANASTOTA, N. Y.—A meeting of the directors of the Farmers' Telephone Company was held recently, at which it was decided to increase the capital stock from $1,000 to $10,000.

HOLLY, N. Y.—The board of trustees at a meeting held recently, granted a franchise to the Interocean Telephone Company through its representative, Mr. Daggett. The company has about 200 contracts for telephones in this territory, which it proposes to center in Holley.

STAUNTON, VA.—The Lexington city council has granted a 30-year franchise to the Mutual Telephone Exchange, which includes Clifton Forge, Staunton, Waynesboro, BuenaVista, and other towns.

ELECTIONS.

BALTIMORE, MD.—Important changes were made in the active management of the Maryland Telephone and Telegraph Company. Mr. George R. Webb resigned as president and member of the board of directors, and Mr. David E. Evans, formerly vice-president, was elected to succeed him. Messrs. Webb and Evans were mainly instrumental in organizing the company a few years ago, and since have been developing its lines with excellent results.

JACKSON, MICH.—The Citizens' Telephone Company, at its annual meeting, elected the following directors: J. C. Richardson, president; E. W. Barber, vice-president; E. B. Fisher, secretary and treasurer; Z. C. Eldred, T. E. Barkworth, George W. Carter, W. H. Maloney, J. B. Ware, W. J. Stewart, R. D. Graham, C. E. Tarte and T. Bromley, Jr., directors.

JORDANVILLE, N. Y.—H. W. Wainman has been elected president of the Home Telephone Company.

WAKONDA, S. D.—The Wakonda Telephone Company has elected M. J. Chaney, president; F. A. Swezey, vice-president; Samuel Jacobson, secretary, and L. C. Northrup, treasurer. Plans are being made for further extension on the lines.

COMBINATIONS.

OSAGE, IA.—The Eureka Telephone Company, of Osage, has purchased the Staceyville Telephone Company for $14,500. G. G. Gardner, of the Staceyville Company will manage both companies.

JACKSON, MICH.—Nelman Wing, manager of the Wing system of Independent telephones, yesterday made connection with the Washtenaw Home Telephone Company. This gave a complete Independent system between Jackson and Ann Arbor.

SILVER CITY, N. M.—Oliver Williams is authority for the statement that a California corporation has had one of its managers in this city for several days looking over the Grant County Telephone System with the idea of purchasing.

PERSONAL.

SIOUX CITY, IA.—Frank Bills, of the Sioux City Telephone Company, has returned from Chicago, where he went on business connected with Sioux City's new Independent telephone system, now in progress of construction.

YOUNGSTOWN, O.—W. F. Crossley, manager of the Youngstown Telephone Company, has resigned to become State superintendent of the Colorado Telephone Company, with headquarters in Denver.

BOWLING GREEN, KY.—Joe W. Gilbert has been made business manager of the Home Telephone Company, and will enter upon the discharge of his duties on the 1st of August.

BELLINGHAM, WASH.—H. W. Kent, superintendent of the British Columbia Telephone Company system, is in the city to-day with a party of engineers who are to make the final survey for the telephone cable line which is to connect this city with Victoria, B. C.

MISCELLANEOUS.

EGG HARBOR, N. J.—The Egg Harbor City Telephone Company has commenced business with 65 subscribers and will soon have double that number.

WADENA, MINN.—The Hewitt & Wrightstown Telephone line is completed to Long Prairie. A public pay station has been established at Hotel Reichert.

WILLMAR, MINN.—The Brooten & Sunberg telephone line is now completed and ready for use, and has been so since July 1. The officers of the company are: Ole Kittelson, president; Ole O. Wig, vice-president; Ludvig Iverson, secretary; Nels Nelson, treasurer. The line is a complete metallic circuit, will be operated on a strictly co-operative basis, is 28 miles long—taking in 60 subscribers, so will be a great convenience to the people. The line will connect with long distance at Brooten and Kerkhoven.

SILVER CITY, N. M.—The new directory just issued by the Grant County Telephone Company, is the largest and most complete ever presented to its patrons, for the service now covers a wider field.

PAPILLION, NEB.—The central office of the Independent Home Telephone Company has been moved to larger quarters.

NASHVILLE, TENN.—The local telephone company at St. Johns, Mich., which handles an extensive rural service, is seeking to make its service indispensable by furnishing subscribers with the Government daily weather reports and other important news of the day.

NEW COMPANY NOTES.

PETALUMA, CAL.—The Vallejo Township Telephone Company, with headquarters in Petaluma, has been incorporated with a capital stock of $5,000, by John Caltoft, William Everet, G. W. Ormsbym, Henry Graeff and J. R. Denman.

GRANDVILLE, IA.—The Grandville & Remsen Telephone Company has been incorporated with a capital stock of $2,000. The officers are: J. F. Kriege, president; P. H. Krohnke, secretary, and P. N. Hansen, treasurer. The other members of the board of directors are Mat. Hansen, John Towsfeldt, John R. Dornbusch and Henry Sauer.

BELVIDERE, ILL.—The Boone County Rural Telephone Company, of Belvidere, has been incorporated with a capital stock of $2,500, by Fred W. Plane, D. W. Barnigham and H. S. Hicks.

HARTLEY, IA.—The Grant & Omega Rural Telephone Company has been incorporated with a capital stock of $4,000. The principal place of business will be at Schoolhouse, in district No. 2, on section 3, in Grant township, O'Brien county, with post office address at Hartley. The board of directors are: W. S. Voss, Pendleton Powers, Rudolph Lemke, Louis Putnam, James Farquhar. The officers are: C. A. Magee, president; William Welch, vice-president; J. T. Shinkle, treasurer, and R. H. Wohler, secretary.

SCRANTON, IA.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $10,000.

STOCKPORT, IA.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $10,000.

UTICA, ILL.—At a recent meeting of the Farmers of Banner Township, held in Utica, the Banner Telephone Company was organized with the following officers: John Rosscamp, president; Milliard Rommine, vice-president; G. S. Betts, secretary; Jesse Rommine, treasurer.

CHINA, ME.—The China Telephone Company has ben incorporated with a capital stock of $10,000. The officers are: W. J. Thompson, of South China, and Fred B. Foye, of China.

PRESQUE ISLE, ME.—The Farmers' Telephone Company has been organized by citizens in this vicinity, and headed by Frank Hackett.

MORTON, MINN.—The Morton Rural Telephone Company has been incorporated with a capital stock of $25,000.

ROLLA, MO.—The Rolla Telephone Company has been incorporated with a capital stock of $20,000 by Noel A. Kinney, Robert A. Love, C. E. French, A. L. McRae, James B. Harrison.

FREDERICK, OKLA.—The Frederick Telephone Company has been incorporated with a capital stock of $3,500, by A. X. Campbell, J. M. Bellamy and M. F. Merrill, of Asher.

GIRARD, O.—The Girard Telephone Company has been incorporated with a capital stock of $35,000, by E. L. Hauser, G. J. Jones, W. J. Wallace, J. C. Krehl, S. C. Thayer, E. H. Luize and R. T. Izant.

EDINBORO, PA.—The Edinboro Telephone Company has been organized and application will be made on August 12th for a charter. The application will be signed by J. F. Bigler, C. S. Darrow, Fred Le Suer, E. P. Perry, I. R. Reader, W. A. Proud, G. W. Minium and others.

ERIE, PA.—Application will be made for a charter on August 23d for the Union Telephone Company of Erie, by W. T. Trask, W. H. Wilson, James Russell, W. D. Barnard and Ellis L. Orbis.

PITTSBURG, PA.—Application will be made on August 22nd for a charter for the Pittsburg-Butler Telephone Company, by J. G. Splane, presi-

Digitized by Google

dent, Pittsburg & Allegheny Telephone Company· John S. Weller, and T. J. Schuffin. Pittsburg & Allegheny Telephone Company contemplates securing connections with Independent telephone systems within a radius of 100 miles of Pittsburg.

SHERMAN, PA.—The Sherman-Hale Telephone Line has been incorporated with a capital stock of $700, to connect Sherman, Pa., and Hale's Eddy and Deposit, N. Y. The incorporators are: Charles H. Stiles, of Deposit, N. N. Gardiner, Fred Kingsbury, John Thomas, of Hale's Eddy, B. W. Raymond, Geo. B. Arneke, and William Rackwell of Pa.

AMBERG, WIS.—The Amberg Home Telephone & Telegraph Company has been incorporated with a capital stock of $3,000.

UNION GROVE, WIS.—The Union Grove & Paris Telephone Company has been incorporated with a capital stock of $2,000. The incorporators are: Henry Barnes, O. P. Gorham, C. E. Parthoff.

CANONSBURG, PA.—The Farmers' Mutual Telephone Company, of Washington County, has been incorporated with a capital stock of $30,000, by S. N. Hopper, J. R. McPherson, B. K. McConnell, C. M. Linn, H. H. Bebout, R. G. Lutton, R. L. Munce, John Fulton, of Canonsburg; R. B. Blaney, S. Otto Black, J. C. C. Peas, W. H. Martin, of Washington, and H. H. Mollenaur, of Eighty-Four.

WASHINGTON, PA.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $3,000, by the following directors: S. H. Hopper, J. R. McPherson, E. G. McConnell, C. M. Linn, H. H. Bebout, R. G. Lutton and others.

MANSFIELD, S. D.—A meeting of farmers and business men to organize a telephone line from Mansfield to Scatterwood and points west has been held. The charter will provide for a capital stock of $25,000, to be issued in shares of $50 each. The directors of the concern are Geo. Woodford, John Harrington and C. S. Granger.

NASHVILLE, TENN.—The Consolidated Telephone and Telegraph Company has been organized at Huntingdon, Carroll County, with a capital stock of $50,000. The company will build and operate lines in Perry, Wayne, Hardin and adjoining counties in Tennessee.

CHEAPSIDE, TEX.—The Cuero & Cheapside Telephone Company, with principal office at Cheapside, capital stock $5,000, has been chartered. Purpose, to build telephone lines. Incorporators: J. E. Lord, J. F. Elder and C. F. Carson.

ALEXANDRIA, VA.—The Central Mutual Telephone Company, of Alexandria, has been incorporated with a capital stock of from $500 to $5,000. William M. Wheeler is president, B. F. A. Myers, secretary, and A. Conner, treasurer, of the company.

DAMASCUS, VA.—The Damascus Telephone Association has been incorporated with a capital stock of $2,000.

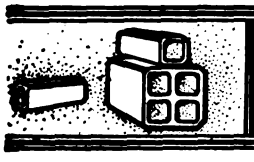
FREDERICKSBURG, VA.—The Toluca & Fredericksburg Telephone Company has been organized with the following officers: Hugh Aida, president; C. A. Bryan, secretary; The Conway, Gordon & Garnett National Bank, of this city, treasurer. The line will run from Toluca to Fredricksburg, via Garrisonville, Stafford Court House, Brooke Station and Boscobel.

CAMBRIA, WIS.—The Cambria Co-Operative Telephone Company has been incorporated with a capital stock of $1,000.

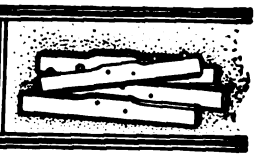
UNDERGROUND.

QUINCY, ILL.—The Central Union Telephone Company is preparing for the installation of its wires in Quincy in underground conduits.

OSWEGO, N. Y.—The Empire State Telephone Company has solicitors to secure permission to put its wires underground.



New Construction in the Field



HUNTSVILLE, ALA.—The planters in the Green Grove district have organized a company with $2,000 capital to furnish themselves telephone connections with this city. There are about 20 subscribers.

SAN DIEGO, CAL.—Coincident with the completion of the concrete foundation for the Home Telephone Company's new building on Sixth street, the plans for the structure proper were received from the Automatic Telephone Company of Chicago, to whom they were referred for approval. The drawings show an extremely handsome front, the materials of which will be brown stone to the second floor, above which pressed brick and terra cotta will be used.

SAN DIEGO, CAL.—The Home Telephone and Telegraph Company is doing some remarkably fast work in installing its plant in this city.

LAKEVILLE, CONN.—A new telephone line will soon connect with the Sharon line at H. B. Conklin's. This new line is known as the State Line Telephone Company. The Dutchess County connections will comprise all the towns in the county.

SIOUX CITY, IA.—The bids on the new telephone exchange to be erected on Jones street by the Sioux City Telephone Company will be opened Wednesday.

SPENCER, IA.—A new rural telephone line is in process of construction in the eastern part of the county.

HOPEDALE, ILL.—The Farmers' Full Metallic Telephone System of Hopedale has its line within a few miles of Mackinaw and will enter that village in a short time. The company has asked franchises in a number of towns which will all be entered in a short time.

HILLSBORO, ILL.—The Big Four Railroad is making arrangements to install a number of telephones along their road between this city and Mattoon.

ROCKFORD, ILL.—At a meeting of the board of directors of the Rockford Home Telephone Company, it was decided to double the capacity of the local telephone exchange and to pay up the 6 per cent. bonds new outstanding against the company. The reissuance of 5 per cent. bonds was voted as a substitute. The present equipment of the exchange is 2,000 lines. This capacity will be increased to 4,000 at an expense of between $50,000 to $100,000, which will affect all of the outside and inside apparatus.

STERLING, ILL.—The Interstate Telephone Company is making arrangements to rebuild its plant in this city. All lines will be made copper metallic.

FREDERICKSBURG, IND.—W. R. Trotter is superintending the work of constructing a telephone line in this vicinity.

NICHOLASVILLE, KY.—The Flemingsburg Telephone Company has begun work on a long distance line between Flemingsburg and Carlisle. The line will pass through Elizaville, Ewing, Cowan, Pleasant Valley, and when completed will afford a through and more direct connection with all points throughout Central Kentucky.

OWENSBORO, KY.—The Home Telephone Company is arranging to construct 12,000 feet of cable through the western part of the city. It will install a four party selective ringing system and make other improvements. The company now has 1,364 subscribers.

COUNCIL GROVE, KANS.—The Council Grove Telephone Company, recently incorporated, is putting in an exchange here and will cover the surrounding country with rural lines.

EXCELSIOR, MINN.—The Twin City Telephone Company of Minnesota, has its line completed to Excelsior and will for the present install a pay station. The company has promised that it will install an exchange in this village next year, when it will make an active canvass for its subscribers.

FAIRMONT, MINN.—The telephones for a new line, the Rutland Central, are to be run from Chas. Sloneker's place to Northrop. There are twenty subscribers and a first-class line is being put up. It will probably connect with the Granada central when it is completed.

ALTON, MO.—The Kinloch Telephone Company has started construction work on its toll line to Springfield.

ALBION, NEB.—W. W. Baker was up from Boone recently in the interest of the Independent telephone that is headed toward Albion from both north and south.

MONCTON, N. B.—The contracts for the new telephone building at Moncton have been awarded. The new building will be two story, brick, with wood basement.

BLUE SPRINGS, NEB.—Plans and specifications for the new office building for the Independent Telephone Company have been made and work upon it will be commenced soon.

HASTINGS, NEB.—The Hastings Independent Telephone Company has filed its acceptance of the franchise granted by the city council on June 28th. The company has engaged board for a large force of men and will begin construction work at once.

OMAHA, NEB.—The Plattsmouth Telephone Company is installing a 200-drop switchboard at the Live Stock exchange.

MONTGOMERY, N. Y.—There was a meeting here recently at which steps were taken for the organization of an Independent telephone company to construct a local system. A committee was appointed to investigate and report later. It is proposed to connect with the Orange County Telephone Company of Middletown, the Colonial Telephone Company of Newburg, and the Highland Telephone Company of Highland.

KENSAL, N. D.—A telephone line will be constructed from Kensal to McHenry.

MADISON, N. Y.—The Madison Mutual Telephone Company, which at present has 250 subscribers, has purchased the line between Morrisonville and Pratts and will use it in extending its system among farmers in that section.

ANN ARBOR, MICH.—The Washtenaw Home Telephone Company, which is an Independent company bucking the Bell people, has opened up connections with Jackson and will thus gain access to the western part of the State.

DULUTH, MINN.—The People's Telephone Company yesterday installed long distance service to Solon Springs. Hawthorne has also been added to the long distance line.

NICHOLS, N. Y.—At a meeting of the Nichols Independent Telephone Company several improvements were decided upon.

WATERVLIET, N. Y.—Mayor Hilton has notified the Home Telephone Company that it must have its local telephones in operation within one month or the franchise will be revoked.

KENSAL, N. D.—J. O. Johnson and H. A. Stonson, of this place, were in McHenry recently and made arrangements with business men of that town to construct an exchange to connect with the system at Kensal.

RATON, N. M.—The poles for 42 miles of the Johnson Mesa telephone line are in place, and by the 1st of August the line will be completed and in operation from Raton to Folsom.

SALEM, O.—A number of improvements will be made at the local plant of the Columbiana County Telephone Company under the direction of Manager C. Y. McVey, of Cleveland, and Manager W. F. Crossley, of Youngstown. A selective ringing system will be installed and a general overhauling of the entire system in Columbiana County. A new switchboard will be placed at East Liverpool having a capacity of 300 lines with 1,000 installed. A cable system will be installed at Seabring.

GAYSPORT, O.—B. D. Doan, of Young Hickory is constructing an Independent telephone line from Gaysport to Cannelville.

TORONTO, ONT.—A Government telephone line is now being built from North Bay to the Temagami district, along the line of the new Government railway. Train orders are given by telephone, and telephones are installed at the various gravel pits along the line. A Government telephone line is also being built from New Liskeard to Haileybury.

CORVALLIS, ORE.—Work on the new Independent line in this city has been somewhat delayed because of the inability to secure pins and cross arms.

LEHIGHTON, PA.—Jacob S. Hoffman is constructing a new line from Lehighton to Normal Square for the Lehigh Telephone Company. Contracts for a number of telephones at the latter point have been secured.

BROWNSVILLE, TEX.—The Brownsville Telephone Company has received its first load of poles. Manager Stegman announces that the system will be in partial operation within 90 days.

AUSTIN, TEX.—The stretch of country between San Antonio and El Paso is to be linked with the long distance telephone, a distance of 600 miles. The Huntington syndicate of California, which is promoting a long distance system from ocean to ocean, is to build the line and make connection with its holdings in Louisiana and Texas on one side, and New Mexico, Arizona and California on the other.

TRADE NOTES

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Chicago, Ill., has recently closed a contract with Ferensen & Crawford, Malone, N. Y., for switchboard equipment.

THE VOUGHT-BERGER COMPANY, of La Crosse, Wis., has been awarded a contract for a switchboard and one hundred installations, by the Barre Mills Telephone Company, of Wisconsin.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY reports a rapidly increasing demand for its platinum electrode transmitters, especially through the Central and Middle Western States.

JULIUS ANDRE & SONS COMPANY, makers of electrical supplies, with offices 225 West Water street and works 187 Second street, Milwaukee, Wis., are ready to send their new catalogue to any telephone company on application.

THE CONNECTICUT TELEPHONE & ELECTRIC COMPANY, of Meriden, Conn., report a big demand for their new and enlarged No. 8 catalogue, which is profusely illustrated with complete telephones and telephone parts. Every exchange man and electrical contractor should have a copy as the company has placed on the market many new and original telephone designs of a very high quality. Both bulletins and catalogues will be sent on request.

THE KNICKERBOCKER CONSTRUCTION COMPANY, of 15 Cortlandt street, New York, has been awarded the contract for the installation of the underground and aerial cables for the new Lewiston-Auburn (Maine) Automatic Telephone Company, amounting to over 100,000 feet. The cable is being manufactured by the Stromberg-Carlson Manufacturing Company, of Rochester, New York.

THE ROLFE ELECTRIC COMPANY, of Chicago, has issued a signed statement in which it gives notice that the license to manufacture under its patents by the American Electric Fuse Company has been revoked and transferred to Frank B. Cook, who now has the exclusive right to manufacture all circuit-protecting devices covered by patents granted or applied for owned by this company.

F. B. COOK, of 240 W. Lake street, Chicago, Ill., has issued a folder describing his No. 444 protector, also a type of test plug used for circuit-testing at the protector, and illustrations of the type L sectional and main distributing frames equipped with Strong sneak-current protectors. A very lucid description is given of the self-soldering heat coil which Mr. Cook manufactures and which is used in conjunction with the No. 444 protector. To all parties interested this bulletin will be mailed upon request.

G. M. GEST, the expert subway contractor, has been awarded the contract for the complete installation of an underground conduit system, including all the electrical distribution to service and house connections, for the South Bend Electric Co., South Bend, Ind. This work covers all of the main streets of that city and will be one of the most complete and modern conduit systems so far constructed. Work is to be completed at the earliest possible moment, and a large force of men will be employed on the construction. The Oliver Chilled Plow Co., which owns a private plant at the same place, has also contracted with Mr. Gest for the construction of its underground conduit system. While not so large as the system for the South Bend Electric Co., it will feed some of the most important parts of the city.

THE F. BISSELL COMPANY, of Toledo, Ohio, is the natural outcome of a wise and wholesome policy whose results are evident in the present progress of the concern, as shown by their last new wire catalogue. This catalogue embraces sixty-one varieties of wire, each of which represents many different gauges, thus making an exceptionally heavy total in this department. The range and assortment of the stock carried by the company is sufficient to entitle them unreservedly to the business of the community. Brains and enterprise have a cash value in these days, and there is no better way to testify to their existence than in the treatment of a business proposition relating to a special branch of trade. In this respect the F. Bissell Company has shown a special aptitude. Its wire catalogue with the extensive line of goods presented there, is certainly a good drummer, whose eloquent silence preaches quality and variety at all times.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR TRADE.—Good farm, well improved, 241 acres; value, about $12,500; for paying telephone plant. Address, Box 457, Oxford, Ohio. 218

A New Series of Telephone Books, entitled

"TELEPHONY"

IN SIX VOLUMES

By ARTHUR VAUGHAN ABBOTT, C. E.

Four volumes are now ready. They embrace the following subjects:

Part I.—THE LOCATION OF CENTRAL OFFICES.
170 pages, 33 illustrations.

Part II.—THE CONSTRUCTION OF UNDERGROUND CONDUITS.
190 pages, 62 illustrations.

Part III.—THE CABLE PLANT.
152 pages, 51 illustrations.

Part IV.—CONSTRUCTION OF AERIAL LINES.
263 pages, 140 illustrations.

Two remaining volumes will be ready in October (Orders taken now). They are:

Part V.—THE SUBSTATION.

Part VI.—SWITCHBOARDS AND THE CENTRAL OFFICE.

The price of each Part is $1.50, postage prepaid. The price of the entire set (six volumes) is $6.00, postage prepaid.

FREE TO OUR SUBSCRIBERS

How You can Secure the Entire Set Free:

Send us 20 **new** subscribers to The American Telephone Journal at $1.00 each, a total of $20 00. We will then send you, all charges paid, the six volumes free.

How You Can Secure One Volume Free:

Send us 5 **new** subscribers at $1.00 each, a total of $5.00. We will then mail the volume you desire free.

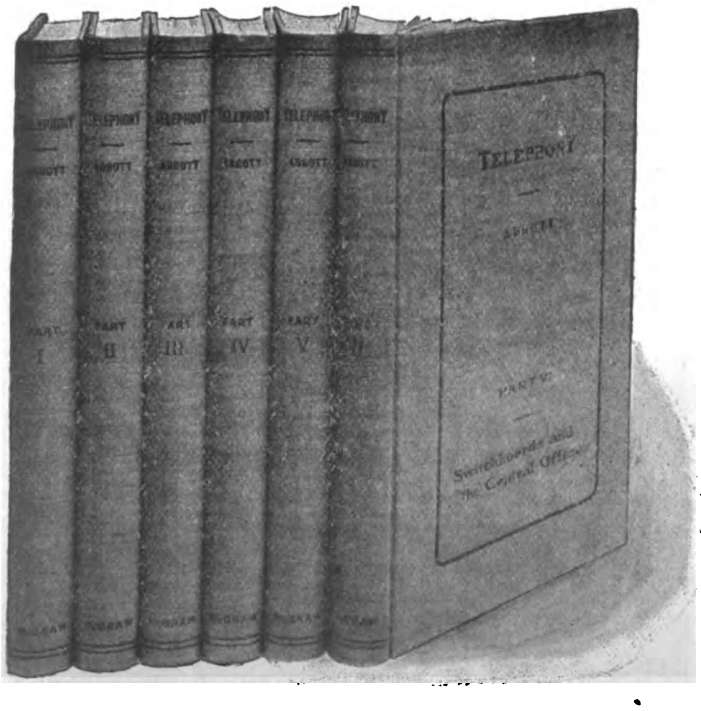
Another Way to Secure the Set:

For $7.00 we will give two yearly subscriptions to The American Telephone Journal, (one of which may be a renewal) and a complete set of six volumes.

For **$7.50** we will give three yearly subscriptions, one of which may be a renewal and a complete set.

For **$8.25** we will give four yearly subscriptions, one of which may be a renewal, and a complete set.

For **$9.00** we will give five yearly subscriptions, one of which may be a renewal, and a complete set.



THE PUBLISHERS IN ANNOUNCING THIS NEW WORK SAY:

"There is telephone literature galore that occupies itself with the discussion of the theory of receiver and transmitter, and a description of the various forms of apparatus used in building telephone exchanges. But there is little information that concerns itself with the engineering design of telephone plants. It is the attempt of the author in this series to prepare a manual that shall deal with the latter phase of the problem, with particular reference to a consideration of the economic features, which lead to the installation of the best plant for the least money."

Advise us at once which of these propositions you intend to accept, so that we can make the necessary arrangements.

THE AMERICAN TELEPHONE JOURNAL

Why Didn't He Want To?

We quote a letter received several weeks ago:

> "Enclosed find money order for One Dollar. Please renew my subscription at once for another year. I cannot afford to miss a single number
>
> "A. F. ADAMS,
> "Mgr. Waushara Telephone Co.
> "Berlin, Wis."

This corroborates just what we have been trying to tell— that The American Telephone Journal is the Best and most valuable paper for the telephone man.

If Mr. Adams "cannot afford to miss a single number" it stands to reason that every telephone man needs this paper. It is well to remember also that even should one number have been missed, it would only have been one out of fifty-two included in each yearly subscription.

Mr. Adams' letter also goes to show that manufacturers and supply dealers should be represented in every number of a paper that is so interesting to its readers.

ONE INSTANCE OF OUR SUCCESS

A certain Independent Telephone Co. in a large Ohio city was giving service to a hotel on a flat rate basis. The Company was finally persuaded to install two pay-stations at this hotel. In two months the stations were so full of money that they wouldn't work. On opening them they were found to contain $41.00. Forty-one dollars in two months as opposed to a yearly flat rate looks as though it were profitable to install pay-stations.

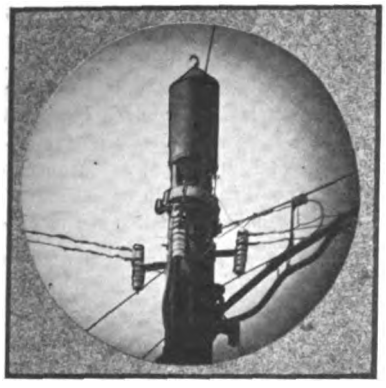
VOLUME 10 SATURDAY, AUGUST 20, 1904 NUMBER 8

MULTIPLE CABLE DISTRIBUTION

ARTICLE II.

By Edward A. Tyler.



THERE is another method of distribution from either underground or aerial cables, called "block" distribution. When this means is employed the cable to the block distributing pole can run either underground or on a pole line and the distributing pole is placed within a block as near the center as possible. Fig. 5 illustrates a loop box and a ring pole for block distribution. In block distribution the terminal boxes are usually of a larger capacity. This is because one pole has to serve a larger number of subscribers. As an illustration, assume a distributing pole in the center of a block. On each side there are the rears of houses that face on four streets. If the blocks are long it is evident that the number of possible subscribers' lines that will terminate at this pole is larger than the number that would usually do so on a loop line. In the latter case, if the number of subscribers became great enough, it would be a comparatively easy matter to tap the cable at some intermediate point and install a new terminal, whereas in the case of block distribution, if the possible growth had not been carefully estimated and a good margin of cable spares and terminals made available, an expenditure would be necessary to take care of new lines. The writer is acquainted with one instance in which half a dozen new contracts were delayed nearly four months because the block distribution was not large enough, and it was impossible to run in new cable on account of lack of right of way. Fig. 8 is an illustration to show one advantage to be gained by means of aerial distribution. Had open wire been employed it would have necessitated the running of insulated wire for a long distance on account of trees, and it is doubtful whether there could have been enough tree trimming to allow running the same number of open wires. The cable records for the system being described have some characteristic features.

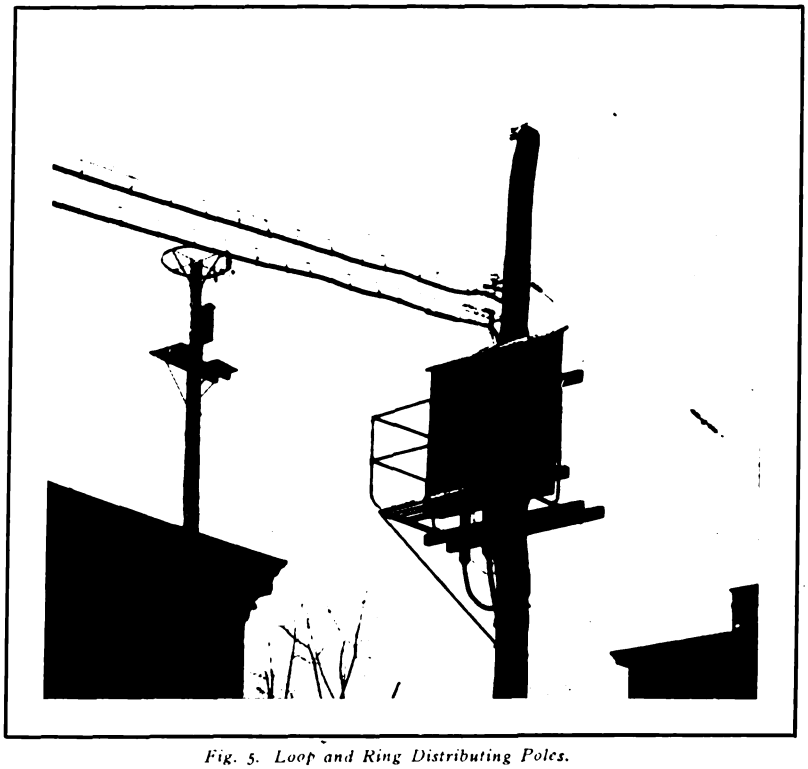


Fig. 5. Loop and Ring Distributing Poles.

The great value of multiple cable distribution is flexibility, and it is evident that the details of the various circuits, such as location and availability, must be clear and concise. With this end in view the form shown in Fig. 7 is suggested. The exchange is called Gerrard, and the underground cable No. 26. As four party line service is employed, opposite each cable pair number are four cross rulings which serve as a record of each party's connections on that line. The first vertical column is the loop column and the successive columns are for the distributing poles. Vertical lines are drawn through the spaces occupied by the various pairs to indicate the loop and distributing poles at which they appear. Referring to Fig. 7, the line under the loop pole heading passes through all the pairs, which shows that G 16 loop is common to all those pairs. This method of indicating the cable boxes at which the various pairs are available is both simple and easily understood. Another scheme sometimes employed for the same purpose is to use a mark such as a cross, but this method of designation is liable to lead to confusion, especially when the work of locating pairs is to be done quickly. Since each page of the cable records is the same there are generally from 10 to 20 vertical columns for distributing terminals according to the extent of the loop line. The size of the page varies, but 25 is considered an efficient number of lines to record on one page. In the illustration only ten are shown.

In the column under G 16-10 the vertical line passes through all the pairs from 1 to 10, indicating that they appear at this point. Pairs from 1 to 5 appear at pole G-16-20, and 2, 5, 8 are connected to the terminal box G 16, 25. Besides these terminals there are two others marked G-16-30 and G-16-40, at which none of the pairs shown appear. There are also four other spaces for terminal boxes which may be installed at some future time. In making provision for such a contingency a great deal of trouble is saved in making new records. The column to the extreme right is for the line order number under which the work of building the subscribers' lines is done.

Digitized by Google

In making the record of a new line it is customary to write the name, address and line order number in pencil, and to put a pencil mark opposite the party's name under the heading of the terminal to which his line is connected. In the case of cable pair No. 1 there are two parties *a* and *y* connected up, the *a* party being connected to terminal G-16-10 and the *y* party to G-16-20. In like manner the circuits of the other parties are indicated. By using pencil it is a comparatively easy matter to change the records at any time when necessary without mutilating the sheet.

If at any time a pair tests faulty it should be marked on the record. First, so that it may not be assigned for a new connection, and' secondly, to show the number of bad pairs in a cable. If the trouble cannot be cleared its location and nature should be written as a reference. When the trouble is cleared then the record should be rubbed out so as not to cause any delay. When a party on a line moves away to a point where it is impossible to use his old line conductors there are two options. One is to assign a new number and the other is to find out if making a drop will enable the old number to be used. As an illustration refer to Fig. 7 and use call number 1268*a* now working on pair 8 out of terminal G-16-10. This party moves to a location which is served from G-16-20 pole. At this pole pair 5 appears as well as at G-16-10 and G-16-25; now all that is necessary to do is to change the other parties from pair 8 to pair 5 at their respective terminals and for the wire chief to have the jumper on the main frame changed from 8 to 5. It often happens that two or more call numbers have their cable pairs changed to make room for a new subscriber.

Fig. 6. Terminal Record.

Besides the cable book another important set of records is that which gives the location of the various cable lines with loop and distributing poles. These are sometimes kept on cards or in a book especially ruled. Each underground cable should have a number of sheets by itself, each sheet being devoted to one loop line, under which heading the various terminal poles are marked. A specimen page is shown in Fig. 6, which will give a general idea. If a new contract is secured near Main and Norman streets, the wire chief looks up the terminal record and finds the nearest distribution pole. Turning to the cable record he can easily decide which pair to use.

From the foregoing it will be easily understood that the records of such a system form a most important adjunct; it is therefore necessary that they should be accurate, to enable the plant to be kept at the highest point of efficiency. Time and labor are very important factors in the successful operation of any system, and since to a great extent their values rely upon the accuracy of details, it is evident that they should be carefully arranged.

THE INSTALLATION OF TELEPHONE CABLES.

H. J. MINHINNICK.

BEFORE commencing the work of installing cables the superintendent may profitably reflect on the marvelous perfection and delicacy of the thing he is about to handle. A telephone cable having from 20 to 600 pairs with each conductor, showing an insulation resistance of several thousand megohms per mile, and any required electrostatic capacity from .08 to .12 microfarads per mile, is a triumph of modern engineering and manufacturing skill. This perfection of detail has been secured only at the cost of unremitting care at every stage of the manufacturing process, and if the cable, after final installation, is to remain in as good condition as when received much care and attention must be given during erection. While a modern cable will stand a vast amount of abuse without completely breaking down, every injury weakens it in some vital point. For instance, the electrostatic capacity depends largely on the amount of free air which separates the conductors—in other words, the looser the core the lower the capacity, and kinks, bends and flattenings which jam the sheath tightly against the core rob the cable of part of this, its most valuable feature, besides materially weakening the insulation resistance.

Beginning with unloading the reels, the too common practice of allowing them to run down an incline from the car or loading platform to the ground and bring up with a jar against blocking or other obstructions cannot be too severely condemned. They should be slacked down slowly and carefully so that no flattening of the sheath can possibly occur. The same precautions should be taken in loading and unloading the cable wagon. Under no circumstances should a cable be left alone with the sheath exposed. Lead pipe seems to present an irresistible attraction to the small boy and the loafer with their jack knives. The reel, if open, should be carefully and completely covered with a tarpaulin or, better still, a man left to watch it.

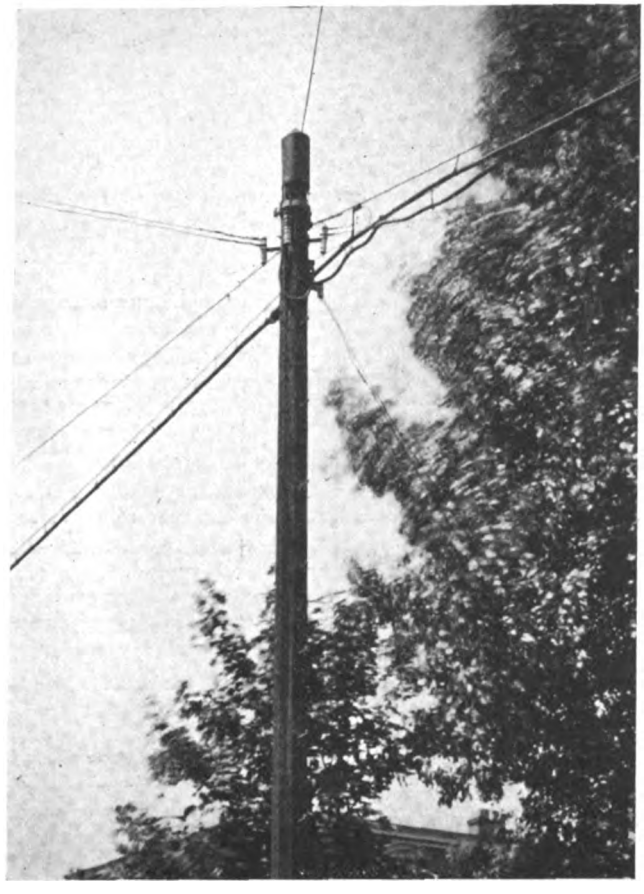

Fig. 8. Advantage of Multiple Cable Distribution.

"Multiple Cable Distribution." See preceding page.

In case of a large installation it will be necessary to store the reels till needed, and care must be taken that they are protected from wanton damage. In smaller installations the reels may be hauled at once to the spot where they are to be used, but in either case the time and place to test the cable is just before putting it into position and as near the scene of operations as possible.

No cable should ever be used without being first tested for grounds, crosses, continuity, capacity, conductor resistance and insulation resistance. The manufacturer guarantees that the cables leave him in perfect condition and, in case of future troubles, may take the ground that the damage was done in the process of installation. Hence the necessity for at least the simpler tests which are within the abilities of every cable user. The only apparatus required for such examination is three or four cells of dry battery and a good telephone receiver of the watch-case pattern fitted with a head band. If desired the battery may be increased to ten cells or more, and a galvanometer substituted for the receiver, but in either case the connections are the same. The sheath should be removed from both ends of the cable for about 6 inches and the core boiled out in paraffine. The conductors at one end are then carefully separated and spread out so that each is clear of all the others and the sheath. To effect this it will probably be found necessary to clip a short piece off each one. The conductors at the other end are stripped of insulation for 3 or 4 inches and bunched together, and a bare wire is wrapped closely around the sheath and the bunch of bare conductors running thence to one pole of the battery, the cells being connected in series. From the other pole of the battery a wire is run to one binding post of the receiver and to the other post is connected the testing wire. The man making the test places the receiver at his ear and withdraws one conductor from the bunch and touches it with the bare end of his testing wire.

The circuit is now as follows: (1) From the battery through all the conductors and also through the sheath of the cable to the open circuit at the far end; (2) from the battery through the receiver and the wire under test to the same open circuit. In other words, there is no circuit unless the wire being tested is (*A*) grounded to the sheath, or (*B*), crossed with some other conductor. Either of these conditions will cause the battery current to flow through the receiver, making a click more or less loud as the resistance of the ground or cross is great or small. It is to be remembered that on first touching the wire under test a slight click will be heard. This is caused by current flowing to charge the conductor owing to its electrostatic capacity. If, however, the conductor is free of ground this capacity click will entirely disappear after the second or third touching of the wires. If any click, no matter how slight, persists after repeated touchings the conductor is faulty and should be so marked. Succeding conductors are withdrawn one at a time from the bunch and the same process repeated till all have been tested. If a faulty conductor be found it should be replaced in the bunch until all are tested, as other wires may be grounded to it and, unless it were kept in circuit, these wires would test clear. Before marking a conductor faulty it is well to examine all connections and the open end of the cable to be sure that the fault is really in the

Digitized by Google

conductor and not in the apparatus or connections. If a galvanometer be used, on first touching the wire under a test a slight deflection will be observed due to capacity but subsequent touchings will not affect the needle if the conductor be clear. A permanent deflection indicates a fault.

The next step is the test for continuity. Reduce the battery to one cell and replace all conductors in the battery circuit as at first. Attach a pair of small cutting pliers to the testing wire and, taking the conductors at the other end of the cable, cut them one at a time. It is evident that the circuit is closed every time a wire is cut and that fact will be announced by a loud click in the receiver. The absence of this click denotes a broken wire. The foregoing tests can be made very rapidly, for four cells of battery will cause a perceptible click in a good receiver, or a galvanometer deflection, through an enormous resistance, and for rough testing no better method can be adopted.

Testing completed, the ends of the cable are cut off and sealed, for the only way to close the end of a cable is to solder it perfectly. The conductors should be driven down half an inch or more with a punch and the sheath neatly hammered down; then make a depression in the center of the end of the closed sheath with the punch, scrape the end bright with the shave hook, flux with tallow and see that the solder flows so as to close every part.

The tests for insulation resistance, capacity, etc., will not be gone into as they have already been elaborately discussed in these pages in the articles on electrical measurements by Mr. Arthur V. Abbott.

SOME REMARKS ON INSTRUMENT SETTING. ENTRANCE TO BUILDINGS.

By B. C. Wilhelm.

In bringing the line into the subscriber's premises the following rules must be observed: 1. The two conductors forming the circuit must be separated by at least 3 inches. 2. The holes through which the wires pass must slope upward as they pass towards the inside at an angle of 20 degrees to the horizontal. 3. The holes in question must be bushed with hard rubber, porce-

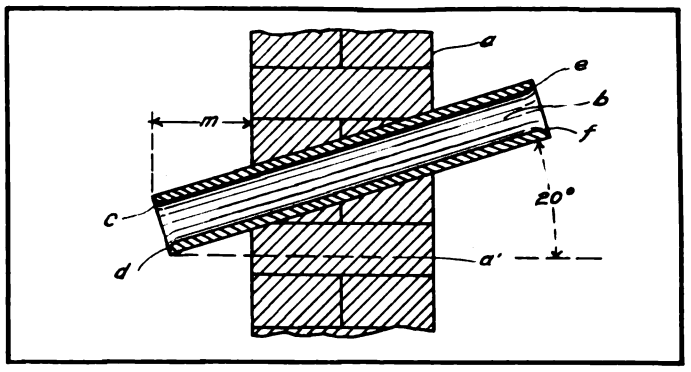

Fig. 1.

lain or some one of the fireproof insulating bushings that are on the market. The material used for the purpose of bushing the holes must, in addition to insulating qualities, possess sufficient strength and rigidity to withstand mechanical shocks, and be impervious to moisture.

Considering all the points in question, porcelain is the best material to use. In insulating qualities hard rubber is superior,

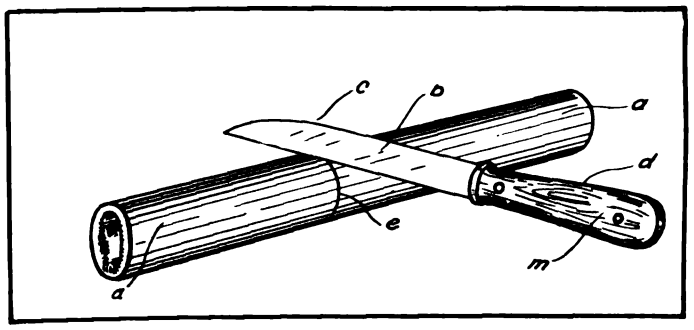

Fig. 2.

but it is much more frail than porcelain, and therefore more liable to be broken.

The holes drilled through the building for the reception of the busihngs must be of the proper size to make a binding fit, so as to prevent the rain from finding an entrance between the outer surface of the tube and the inner surface of the hole, into the interior of the premises. After the wire has been drawn into place, rubber tape must be wound around the wire and the end of the tube, to prevent the rain entering the space between the wire and the inner surface of the bushing.

In Fig. 1 is shown a hole bushed with hard rubber. Here the section of the wall is shown at *a a'*, and the tube at *b*. The dotted lines enclosing the angle of 20 degrees show the proper inclination. The distance of the end of the tube from the outer surface of the wall, denoted by *m*, should be about 3 inches. This tubing comes in lengths of about 2 feet, and it is customary for the instrument setter to "draw" enough of this material to suffice for a day's work; so that he must cut it up into the requisite lengths as he uses it. He can do this either with a hack saw or a sharp pen knife. In Fig. 2 is shown the method of cutting with a knife. The tube *a* is placed on a table, or other suitable flat surface and the knife blade *b* is pressed against it by grasping the handle *m* at *d*. The other hand is pressed down at *c* and the tube rolled along the table until a circular knick *e* is

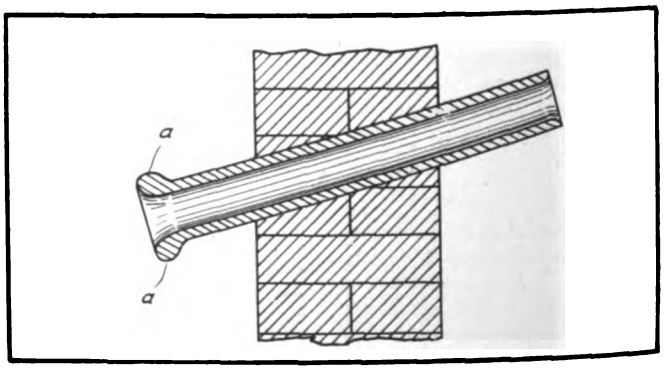

Fig. 3.

cut. When this knick has attained the depth of about 1/16 inch the tube is grasped at both ends and bent. If the knick has been properly cut, the tube will break cleanly at that point. If the hard rubber be heated slightly it becomes soft, and is much more easily cut. This practice, however, has the disadvantage of flattening the tube unless it is done very carefully. The instrument setter should never attempt to break the tube by striking it, as hard rubber is very brittle, and when so treated will shiver into fragments with ragged edges.

Turning again to Fig. 1, it will be seen that the inner edges of the tube are reamed out at *c, d, e* and *f*. This should be done with the knife, after it has been cut to the proper length, in order to remove the sharp edges which would otherwise cut the braid on the wire when it is pulled into place.

In Fig. 3 is shown a hole bushed with a porcelain tube. It will be seen that the tube is constructed with a swelling *a* at one end, and the edges are curved to prevent the braid covering of the

Digitized by Google

wire from being injured as the wire is pulled through. Porcelain tubes cannot be cut by any of the tools that the instrument setter may have at his disposal, so that when this form of bushing is used a tube of the requisite length must be procured.

In Fig. 4 is shown the method of running the wire through the hole. Here the walls shown at *a a'*, and the tube at *b b'*. The wire is shown coming down from above at *c*, being held in place

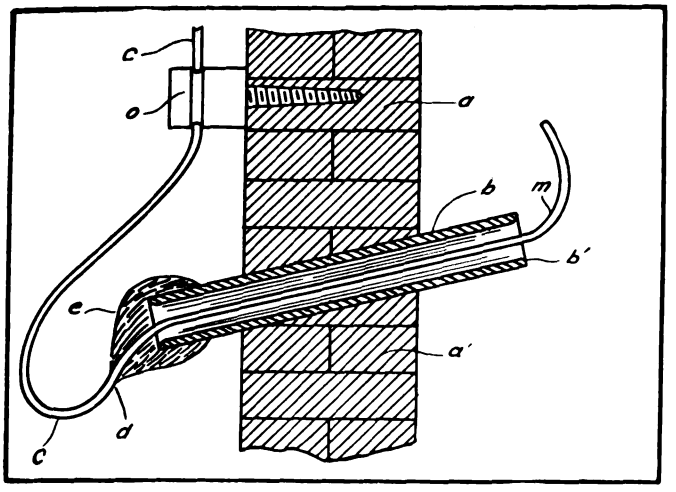

Fig. 4.

by the split knob insulator *o*. It bends around at *c'* into the drip loop *d*. The layer of rubber tape, alluded to above, is shown at *e*. The wire passes through the tube and bends up at *m*.

When the protection apparatus is placed upon the outside of the building, the drop wire ends at this point, and the line is carried inside by means of leading-in wire. The method of doing this is shown in Fig. 5, where *a* represents the drop wire coming down the side of the building, being supported on split knob insulators and entering the iron box *b* surrounding the protection. The ground wire is shown emerging from the center hole in the bottom of the box, and running to the earth on the regulation insulators. The two leading-in wires *c c'* are brought to the two bushings *d d'* and taped in the proper manner. The drip loops are shown at *n n'*.

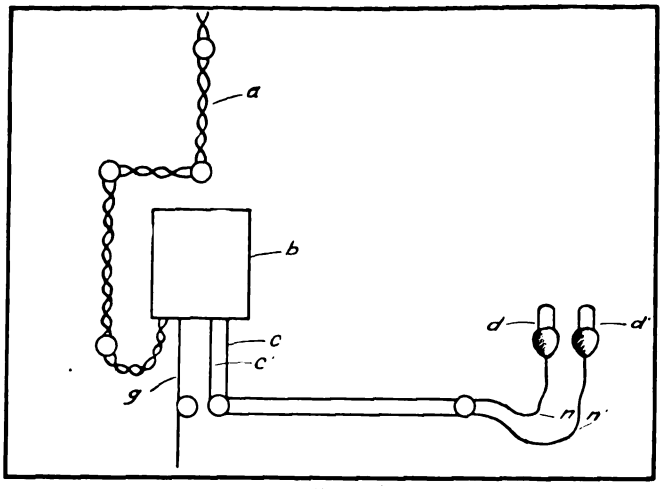

Fig. 5.

The ground wire should never be brought into the building, wherever it is possible to secure a good ground outside. In some cases it is necessary to break this rule, in order to obtain a good ground connection. When it is necessary, however, the entrance must be effected through a separate hole, bushed in the manner already described, and the end of the bushing taped in the regulation manner mentioned above.

ELECTRICAL RESISTANCE AND MEASUREMENTS.

By E. L. Hardin.

THE telephone business, more than any other, necessitates accurate and varied measurements, and the average engineer and electrician may quite readily acquire the knowledge and skill to make the ordinary tests that are necessary with the various instruments which have been designed to meet the different requirements. The practical telephone electrician has to measure electrical resistances, electro-motive forces, capacities of condensers, cables, etc., and each of these several quantities is measured by comparison with certain standards which have been ascertained by repeated experiments. However, we will only consider the measurement of resistances.

Resistance may be defined as that which limits the flow of electricity in a circuit, due to its length, cross section and the material of which it is composed.

For instance, a wire of a certain size of iron or copper will not have the same resistance for 100 feet as for 1,000 feet. Neither will 100 feet of copper wire of a given size have the same resistance as 100 feet of iron wire of the same size. In other words, the greater the length of wire, other things being equal, the greater the resistance, and the greater the cross section of the wire the less the resistance. As far as the geometrical dimensions are concerned the relationship is rigid and scientific, but when we consider the material of which the wire is composed data obtained from direct tests is the only reliable information at the disposal of electricians. Copper, iron, aluminum, and in fact all the metals differ from each other in resistance for equal lengths and equal cross sections.

This is entirely due to their difference in character and has not as yet been explained. It is also known that if a metal is heated its resistance increases, and if it is cooled its resistance diminishes.

It has been necessary to adopt some standard of resistance by which all other resistances will be compared and their value estimated.

From a practical every-day standpoint it might be said that 1,000 feet of No. 10 copper wire, B. & S. gauge, would represent an ohm, but this is not an absolutely accurate value. The exact value of the ohm may be obtained from a column of mercury 106 centimeters high with a cross section of 1 square millimeter. It is a matter of importance for all serious students of electrical tests to make a thorough study of the standards of resistance.

There are four units at present, namely, the Siemens unit, the British Association unit, the Legal Ohm, whose value has just been given, and the last and most accurate, called the International Ohm.

The only difference between the Legal Ohm and the International is not in the cross sections of the mercury columns, both being 1 square millimeter, but in the length of it. In the Legal Ohm this is 106 centimeters; in the International Ohm, 106.3 centimeters. A centimeter is about .4 of an inch and a millimeter 1-25 of an inch, for purposes of ready reference.

Resistances in a circuit may be of two kinds: First, the resistance of the conductors themselves; second, the resistance due to imperfect contacts from which a large percentage of the common telephone troubles find their origin. In order to measure resistances the law of resistance, commonly called Ohm's Law, must be known. This law, discovered by Dr. George Simon Ohm, is the cornerstone of that structure represented by all the theory and practice in electrical engineering. Ohm's law may be stated either verbally or symbolically in algebraic characters. Is is as follows: The current in any circuit is proportional to the electromotive force and inversely proportional to the resistance. By this is meant that the flow of current will increase if the volts applied to a circuit are increased, and the current will diminish

Digitized by Google

if the resistance of a circuit is increased while the volts remain constant. This relationship is shown by the formula,

amperes = volts ÷ ohms; or if C = current in amperes; R = resistance in ohms; and E = electromotive force in volts. Then $E = CR$ or $C = \frac{E}{R}$ or $R = \frac{E}{C}$. Knowing any two of these we may find the third.

These facts may be tabulated in the following manner:

Amperes = volts ÷ ohms.
Volts = amperes × ohms.
Ohms = volts ÷ amperes.

In getting amperes volts are divided, and in getting ohms volts are divided, in one case by ohms and in the other case by amperes.

The resistance of a conducting body may be measured in many ways, but there are three principal methods in practical use. First,

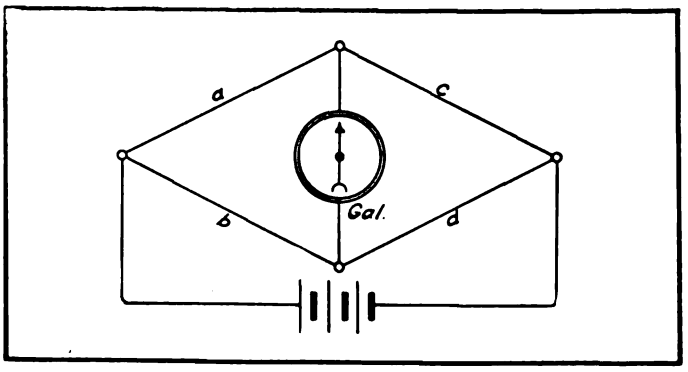

Fig. 1.

by the use of the Wheatstone bridge, slide-wire bridge and the direct reading ohmmeter, which are only modifications of the Wheatstone bridge. Second, by the fall of potential method, which is done with a voltmeter. Third, by the use of a sensitive or high-resistance galvanometer in series with a battery, generally used to measure high resistances such as the insulation resistance of wires and cables.

For general resistance measurements the Wheatstone bridge and voltmeter tests are most suitable, being very accurate, and with little practice great skill may be attained in using these instruments. To understand the working of the bridge, one should understand the underlying principles of its construction. The two laws upon which it is based is first, that no current will flow between points of equal potential; and secondly, the drop of potential along the various parts of a conductor is proportional respectively to the resistances of those parts.

The idea to be conveyed by the phrase "drop of potential" is expressed by that form of Ohm's law known as $E = C \times R$. If two circuits are of equal resistance they will carry the same current when the same electromotive force is applied. At points midway in each circuit a point will be found at which the "drops" are equal. The reason is obvious, when the resistance and current in each current is considered.

Suppose two circuits are connected together at their ends. If both are of copper and of equal length and cross section the same current will flow in each when a battery is connected to the aforesaid ends. An indicating instrument, such as a galvanometer for instance, connected to the middle of each wire, will show no current because the $C \times R$ effect in each up to that point is equal.

This is understood from the sketch, where we have *a c* as one wire and *b d* as the other wire, at the middle of each of which a galvanometer is connected. If *a c* is 10 ohms and *b d* 10 ohms then a current of 5 volts send ½ an ampere through each branch. If the arm *a* represents 5 ohms, the drop in it up to the point where the galvanometer is connected will be $5 \times ½ = 2½$ volts drop. This is also true of the *b* arm, whose drop is likewise $5 \times ½ = 2½$ volts. It is easy to see that with 2½ volts at each connection the galvanometer takes no current. If, however, the resistances of *a* and *b* are different, and also *c* and *d*, then a new principle must be employed, upon which the use of the Wheatstone bridge depends. In line with this principle, the use of the bridge is based upon the fact that when three of its arms are known the fourth can be calculated.

In Fig. 1 we have a diagram of the bridge, in which *a*, *b*, *c* and *d* represent resistance arms and letting *c* = the unknown resistance, we will get the following solution:

$$a : b :: c : d \text{ or } \frac{b \times c}{a \times d} \text{ or } c = \frac{ad.}{b}$$

New let us consider the measurement of resistance by the use of the voltmeter:

In Fig. 2, we use a key, 100 ohm shunt coil, battery with an output of 30 volts and a double scale 0 to 30 and 0 to 150 direct reading voltmeter. The test for resistance is made by the following formula:—

Let X = unknown resistance to be measured.
B = battery voltage.
D = deflection of voltmeter.
R = combined resistance of voltmeter and shunt.

Then $X = \frac{B - D}{D} \times R$.

For example, referring to Fig. 2, we will pull key lever to make contacts *a* and *b*, and we will get a reading of 15 volts; then pulling the key lever in the opposite direction, to make contacts *c* and *d* we get our battery voltage, which will vary from time to time. Now, we must calculate the combined resistance of the voltmeter and shunt. The rule for finding the combined resistances of two resistances in a divided circuit is the product of the two resistances divided by their sum. Then supposing the internal resistance of the voltmeter is 2,700 ohms when applying

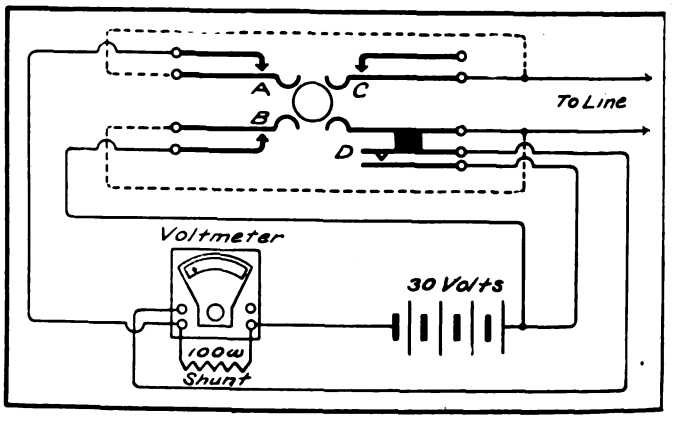

Fig. 2.

the rule, we will find that the combined resistance in this case is 96.4 ohms. Substituting the quantities we have:—

$$\frac{30 - 15}{15} \times 96.4 = 96.4 \text{ ohms.}$$

TELEPHONIC IMPROVEMENTS IN GREAT BRITAIN.

FOR a number of years the British telephone experts have placed great faith and confidence in the ring through principle; that is, the operator simply connects two parties together and the calling subscriber does his own signalling. To the American engineer this method of operating may appear antiquated, but from all accounts received, in a majority of instances, the service has been of a good character. Since the advent of central energy operation with the increased simplicity and rapidity of operating, it has been found advisable to adhere strictly to the American practice in respect to the control and supervision of connections. At the present time upwards of $3,000,000 is being spent in the United Kingdom for telephone extensions and improvements, and it can be confidently expected that within the next few years the telephone service of Great Britain will be as thorough and up to date as that of any other country in the world.

QUERIES

Questions on any subject relating to telephony will be answered on this page.

THE PARTY RINGING KEY.—(405.)

Enclosed is the sketch of a key I have; can it be used for two party ringing; if so, show connections? T. L.

The key you illustrate is adaptable for two party ringing, the connections being shown in Fig. 405. The wiring should be as shown; that is, the wires from the listening key, which is placed on the answering side of the key, connect with the inside springs on the *A* side and the calling circuit is connected to the middle springs on the *C* side.

One side of the generator should be grounded and connections made between it and the outside springs of the key, as

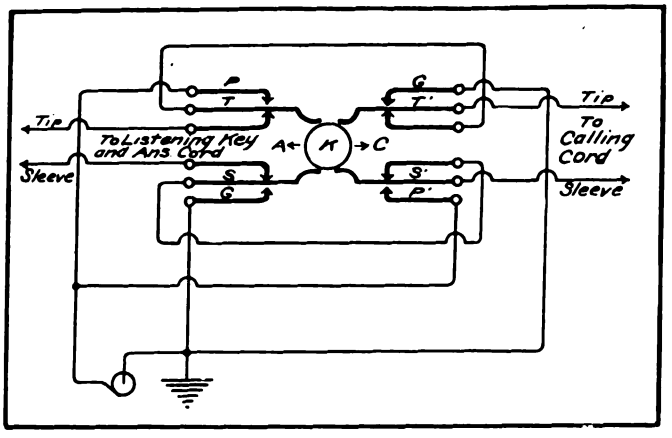

Fig. 405.

shown. Now, if the key is pulled in the direction of *C* it will cause the button *K* to move in the direction of *A*, causing the springs *T* and *S* to make contact with the ringing contacts *P* and *G*, respectively.

If the key is pulled in the direction of *A*, then the roller *C* causes the springs *T'* to make contact with *G'* and *S'* with *P'*.

By following out the circuits it will be seen that under the first condition the grounded side of the generator is connected with the sleeve side of the line and in the second condition it is the tip side that is grounded.

METALLIC CIRCUITS.—(406.)

We have several grounded circuits run with No. 14 copper wire. As the lines are very noisy and there is considerable cross talk, I suggested to the company to make all the circuits metallic. They say they can't stand the expense of new copper but are willing to get iron wire. What I would like to know is this: Would it be better to take down enough of the copper wire make one-half copper and then run iron for the remainder, or to let the copper wire stand and run the iron wire the entire length of the circuit? P. L.

We fully agree with your suggestion to your Company to make all of the circuits metallic. Past practice in telephony shows conclusively that first class service can only be secured by means of carefully designed and properly built metallic circuits.

It is to be regretted that the Company feel that they cannot afford a copper circuit and we believe that in the long run they will find it by far the cheapest policy. Copper wire is almost everlasting and requires but small annual maintenance expense. Iron, on the contrary, rusts rapidly, and even under the best circumstances the interest on the capital invested in the copper is much less than the annual depreciation of the iron wire line.

We would certainly not advise the removal of any of the copper wire which you now have up; on the contrary, if the Company will not approve of the necessary expense to make the lines copper metallic and are only willing to indulge in the penny wise and pound foolish plan of constructing them of iron, it would be better to allow what copper is in existence to remain and fill out the balance with iron. Making the circuits metallic with iron will undoubtedly give you better service, but with this expedient you cannot expect the lines to be as quiet as they would be with copper wire, for the reason that the magnetic qualities of iron wire are entirely different from copper and are more likely to contribute to the existence of cross talk.

PROTECTING POLES.—(407.)

We have several toll lines which run for considerable distances, one of them for 15 miles, another for 7 miles. Should the poles be equipped with lightning rods? If so, how often? Also, should the lines be fused? It is at present protected with heat coils and carbons. B. G.

Telephone companies almost universally adopt the practice of equipping the poles of aerial lines with lightning rods, while on the whole it has been found a wise precaution, the number of lightning rods to be put on, will depend somewhat upon the situation. In mountainous countries, where thunder storms are frequent, protection should be introduced more freely than in countries where lines are running over a level plane, and in a climate where thunder storms are of rare occurrence. In some countries it is considered best to have at least one lightning rod per mile, and where the exposure is great, it is wise to introduce three or four.

TYPES OF PINS.—(408.)

We would like you to furnish us the details of various pins used on telephone lines. N. Tel. Co.

There are both iron and wooden pins used in telephone construction. Of the latter there are three types each used for different purposes. These are illustrated in Fig. 408, together with dimensions. *A* is termed the line pin; *B*, the transposition pin, and is used when transpositions are to be made, and *C* is used for terminals. Iron pins vary slightly in design, but in general con-

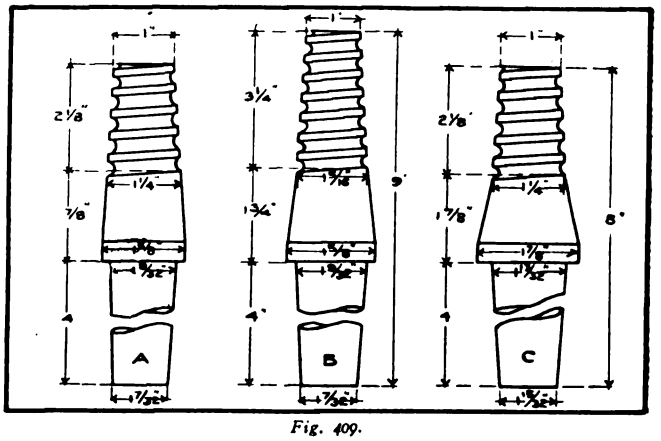

Fig. 409.

sist of an iron or steel bolt which has a wooden cap so made as to allow the insulator to be screwed on.

POWER TO RUN GENERATORS.—(409.)

Please let me know if there is any difference in the power necessary to run a pulsating electric generator and an ordinary direct current generator, both machines being exactly alike. The reason I ask is that it seems to me that the breaks and self induction either help or retard the power that turns the armature. F. H.

In answer to your query, we beg to advise that while theoretically there might be a slight difference in the amount of power consumed in a pulsating ringing current from that of the ordinary alternating current, it will not be noticeable in practice. While the shape of the wave has something to do with the power expended in the ordinary ringing generator, the friction and windage of the machine, together with the power required for the brushes, and the losses of the armature and field coils are so much greater than the amount of power required in the ringing current, as to entirely mask any difference due to shape of wave.

The Editor's Page.

AN INDEPENDENT EXAMPLE.

THE history of telephony on the Pacific Coast is unique. Separated by the breadth of a continent from Boston and the baleful influence of the Bell, completely dominated by the brililant, though erratic Mr. Sabin, rich in population, richer in material wealth, and richest in a people who understand, appreciate and demand the telephone, the strip of territory from Seattle to the California Gulf, and from the coast to the Rockies, presents the most inviting of telephonic fields. For nearly two decades the Sunset Telephone Company possessed this, almost the most attractive telephonic territory in the United States. There were no signs of a rival. The Sabin-Hampton express system was, by its inventors, loudly declared to afford the quickest, best and cheapest service that could be given. The ten-party line and the nickel telephone, claimed by the indefatigable Mr. Sabin to be the only method of serving the small user, were born and bred in San Francisco. But the old story, told in the ancient past of the Jewish captivity, had to be repeated, and a few years ago the Independents wrote upon the Rocky Mountain wall the *"Mene mene tekel upharsin"* of the Pacific States Telephone Company, and now from Crescent City to San Diego the Independents are working.

Take as an illustration what has been done in Los Angeles. This is one of the most flourishing and interesting of Californian cities, having a population of approximately 125,000. For a number of years the Sunset Telephone Company telephoned this town, and with their best efforts, according to recent statistics, had secured approximately 12,000 instruments, or about one instrument to over 14 persons. A couple of years ago, or thereabouts, the Independent interests took hold. To-day they have a main office located at 246 South Hill street, to which extend 9,120 main lines, with 411 private branch exchange trunks, serving 14,301 telephones. There is also a branch office at Hollywood, where there are 132 lines in operation, and the office at Grand avenue opened August 1st with 2,000 lines, making a total of 11,252 lines, serving in round numbers 15,000 instruments. In connection with the branch offices there are 74 private branch exchanges, carrying from 10 to 250 lines each.

Over and above the subscribers actually in service the company has over 5,000 contracts now pending for which it has, as yet, been unable to secure the necessary substation apparatus. These subscribers, however, will be served as rapidly as the telephones can be obtained so that it is probable that within the next six months the Independent interests will serve upwards of 20,000 telephones. To-day the Independent instruments outnumber the Bell.

Of all the peoples in the United States the Californians are of the most loyal and open-hearted type. Excellent friends, they are equally good foes, and had the Sabin-Hampton express system, with all its frills and furbelows, furnished a service which was even remotely satisfactory; had its owners displayed but a moderate appreciation of the rights of the public; had they been in the least alive and responsive to the demands of California subscribers, and had they indicated a sincere endeavor to meet the requirements of their patrons, it would have been impossible for the Independents to make such a record. But statistics are stubborn, and it is now an incontrovertible fact that the Independents lead. What has been here accomplished is only an indication of what may be done in every California town.

THE QUICK ANSWER.

THERE is something said somewhere about the soft answer that turneth away wrath. In the telephone service it is the quick answer that prevents wrath. And prevention is a good deal better than turning away. There is nothing so exasperating to the average telephone user than a slow answer from the exchange—unless perhaps it be the total disappearance of the operator after having answered. On the other hand there is nothing so exhilarating to the subscriber than a uniformly quick answer. If he gets that he feels that there is something doing, that there is go and smartness about the service. It is a good thing to cultivate such a feeling among your subscribers. A subscriber who is accustomed to invariably prompt attention from "central" goes to the telephone with a confident feeling that he is going to be well done by.

It is worth much money to a telephone company to imbue its customers with a feeling of confidence that this will happen. Once the call has been answered the subscriber feels that business has started. It may take some time to get the second party on the line, but every user of the telephone service knows that the telephone company cannot drag people to the telephone; it can only ring the bells and trust to the general common-sense of the public for prompt attention to the call. The promptness of the answer to the original call, however, is absolutely under the control of the telephone company, and it is mainly by the promptness or slowness of this operation that the telephone-using public judges of the service. If the answer is uniformly quick the public finds the service good. If the answer is slow—sometimes quick, but generally slow—the public finds the service bad. And there is a good deal to be said for this point of view. We do not contend that a quick answer alone constitutes good service. Obviously there is a good deal more in the service than that. But if the plant is of such a nature and the general efficiency of the operating staff is so good that the answer is uniformly quick, the remaining operations are likely to be conducted with efficiency also. From the public view, however, the point is that with the operator's answer to the call the business of getting the connection really begins. Until the operator answers the subscriber is merely waiting on the doorstep, so to speak, and he knows that the operator is just the other side of the door. Consequently, although he is generous in his appreciation of promptness, he brooks delay with much impatience.

This being so, and it will not be disputed by any user of the telephone service that it is so, what measures must a telephone manager take to give his subscribers the quickest possible attention to their calls? He must have a good line plant, so that all signals effectively reach the exchange and false signals do not; he must have efficient signals and he must have a thoroughly well trained, efficient and smartly supervised operating force. A good line plant, let us hope, goes without saying nowaday. On the training and supervision of the operating staff too much stress cannot be laid. The operating staff can make or mar the service, or at any rate, they can make all the difference between a passably good service and one that is thoroughly smart and highly satisfactory to the subscribers. The wise manager will inform himself continuously of the quality of service supplied by making continuous tests of the service, so carried out that the actual service as experienced by the public is tested. In this way only can the manager be sure of what his customers are getting.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

THE TOWN'S ULTERIOR MOTIVE.

THE town of Owen Sound, Ontario, was given some sharp raps over the knuckles from Chief Justice Meredith in a judgment given in the suit of the Bell Telephone Company for an injunction to restrain the town from interfering with the laying of cables upon certain streets.

The town forbid the company laying a conduit across Poulett street to their new offices on the ground that the road could not be restored to its original condition. In regard to this objection his Lordship said:

"The road is but a macadamized one, and one that is often opened for far less generally useful purposes. Any objection to the work on this ground is purely a subterfuge to cover some ulterior purpose, and that purpose is plain, namely, to coerce the company to pay to the town a tax upon their business, which the town has no sort of legal right to demand. Their objection to the work is not made in good faith, but for a purpose *ultra vires* and wholly unwarranted.

"Parliament has clearly and distinctly given the plaintiffs power to carry their wires over or under public streets, but has made that right subject to certain rights. These latter rights must be exercised in good faith, and for a legitimate purpose, and should be reasonably exercised. Instead of that they have been unreasonably exercised in bad faith and for a purpose not authorized within the power of the defendants, so that whatever those rights may be the company is entitled to succeed in this action. The defendants will therefore be perpetually restrained from interfering with the work of the plaintiffs in carrying their wires to their new offices under, instead of over, the highway.

"Upon the broad question of the power of the municipal councils under the amended Federal Act, the extravagant claims of Owen Sound, that it rests with the town to determine as they see fit where and how the company shall construct their lines, seems to be quite unwarranted by the Act."

TELEPHONE LINES REAL PROPERTY IN ILLINOIS.

THE last General Assembly of Illinois passed a law making the property of telephone companies, particularly the lines and poles, real instead of personal property. Under the old law the property of telephone companies was considered personal; as such it could not be mortgaged to raise money. The only way money could be borrowed was by giving chattel mortgage which was good for only two years. This made money hard to get and the rate high. It is now possible for a railroad company to issue bonds, secured by real estate mortgage, and borrow money at a lower rate. Assessing officers and boards of review throughout the State are considering the question of raising assessments of telephone companies because of the change.

RIGHT TO CUT POOLROOMS OFF.

JUDGE SCOTT in the Supreme Court of New York has stated that he would not grant a mandatory injunction restraining the New York Telephone Company from interfering with the telephone service which it has contracted to give to the New York and New Jersey Distributing Company, known as the "Racing Syndicate." He said if any contract to furnish the service had been violated the remedy was an action for damages for the violation. "This court never issues mandatory injunctions if it can possibly avoid doing so," remarked Judge Scott, "and in this case you can bring an action to recover damages for any injuries you may have sustained." Counsel for the company, in opposing the motion, submitted affidavits of the police to show that the applicant company was supplying a poolroom with racing news, which brought forth the rejoinder from petitioner's solicitors that as the telephone company had not made any objection to sending out racing news for years, there was no reason why it should do so now.

Judge Scott, however, looked upon the change of view of the telephone company with some commendation, saying: "Even the late repentance of the telephone company is to be encouraged instead of discouraged. If it believes its property is being used for unlawful and immoral purposes the telephone company has the right to refuse to live up to its contracts. It is not the duty or right of any equity court to compel the company to do what it believes to be wrong."

CONSOLIDATION OF TELEPHONE COMPANIES.

IN an expropriation suit the Cumberland Telephone and Telegraph Company sought to acquire the right to erect and maintain its lines over the right of way of Morgan's Louisiana & Texas Railroad and Steampship Company. The court ordered a jury of freeholders to be drawn to assess the value of the right of way to be taken. On the day fixed for impaneling the jury, the defendant appeared and challenged the venire. The motion to quash was overruled and defendant filed an exception to the result and an answer. The trial resulting in a verdict for the plaintiff, the defendant appealed.

The principal objection of the defendant to the result was that the evidence did not show the alleged corporate capacity of the plaintiff company. The plaintiff corporation was formed as the result of the consolidation of three previously existing telephone companies. The legal existence of these companies was not questioned, but it was urged by defendant that, subsequent to their incorporation, the State of Kentucky adopted a new constitution containing the following provision: "No corporation in existence at the time of the adoption of this constitution shall have the benefit of future legislation without first filing in the office of the Secretary of State an acceptance of the provisions of this constitution; that in 1893 the legislature of Kentucky adopted a general law relating to private corporations and authorizing consolidations, but excluded from its benefits all corporations which had failed to comply with the requirements of the above section of the constitution; and that the evidence did not show that the constituent companies consolidated under the name of the plaintiff had complied with this condition precedent." The court held that when corporations assert rights dependent upon their legal existence, they must prove compliance with conditions precedent required by the organic law of their domicile. It therefore reversed the verdict and remanded the case for further proceedings, giving the plaintiff an opportunity to prove its compliance with the constitutional requirement in case it could do so.

Another objection of the defendant was that the jury was illegally drawn because the jurors were required to be freeholders. Upon this point the court held that the law requiring a jury of freeholders in expropriation cases, being a special statute enacted in a particular manner, was not affected by the general statute subsequently enacted, providing for the drawing of jurors for the trial of civil and criminal cases, the defendant having contended that the latter statute controlled the subject. Cumberland Teleph. & Teleg. Co. vs. Morgan's La. & T. R. & S. S. Co. (111 La., 36, S. 352).

MUST SHOW UP BOOKS.

SPECIAL JUDGE E. A. ELY, sitting in the circuit Court at Evansville, has decided that the Evansville Telephone Company must show its books, papers, subscription list, and all other matters pertaining to its affairs, to the attorney of the plaintiff in the suit of Edward Meyer against the company for the appointment of a receiver. Ten days were given the officers in which to comply with the court's request.

Digitized by Google

IN THE OPERATING FIELD.

WHAT IS A PARTY LINE?

A PECULIARLY interesting case involving the judicial interpretation of just what is meant by a "party telephone line" has been brought in the Cuyahoga County, Ohio, courts by the filing of a request by the Cuyahoga Telephone Company and the Dime Savings and Banking Company for a court construction of the agreement between the bank and the telephone company.

The case grew out of a $3,500,000 bond transaction in which the bank, according to the agreement, gave the company a trust deed, and was to act as trustee of the bond transaction. That was in 1898, when the company was in need of funds for construction, and $2,000,000 was at once realized on the agreement for this purpose.

It was further provided that additional sums of money were to be paid over from time to time as the work of constructing and extending the system went on. The bank claims that according to the agreement desk telephones and party lines were to count only as single connections as showing the growth of the company's subscription list.

The Cuyahoga Company now claims that it has fulfilled the prescribed conditions so that it is now in a position to ask for a further installment of $125,000. It asserts that the connections in dispute are of such a nature as to fall within the terms of the agreement as to being separate connections.

The bank demurs to this claim of the company and the court is asked to decide just what was the scope of the term "party line" according to the agreement between the bank and company in 1899.

FLORIDA TELEPHONE DEVELOPMENT.

A MEETING of the directors of the Peninsular Telephone Company, of Tampa, Fla., was held recently at the office of the I. H. Ditwiler Company, Toledo, Ohio. A proposition for enlarging the system, which was discussed at a meeting there some time ago, was closed, and another proposition for the extension of toll lines and connecting with other systems was taken up.

Among the out-of-town directors attending the meeting were J. H. Goeke, S. A. Hoskins and W. G. Brorein, of Wapakoneta, Ohio. These gentlemen are also interested in several other telephone companies in Florida and Texas.

CITIZENS' COMPANY OF COLUMBUS INCREASES STOCK ISSUE.

THE Citizens' Telephone Company of Columbus, Ohio, has increased its capital stock from $750,000 to $1,250,000. The entire increase will be issued in preferred stock of 5,000 shares at $100 each. The holders of the preferred stock are to be entitled to receive a cumulative dividend at the rate of 6 per cent. per annum, payable semi-annually, out of the profits of the company, in preference to any dividend. The holders of this stock, in case of insolvency or dissolution, will be entitled to receive from the remaining assets, after the payment of liabilities, the full amount of the par value. The increased capital will be used for the extensive improvements that are being made and others that are contemplated.

TELEPHONE GIRLS' CONVENTION.

A CONVENTION of the telephone girls of the Consolidated Telephone Company was recently held in the offices of the company at Clarksburg, Va. The towns of Fairmont, Elkins, Belington, Philippi, Salem, Brown, Buckhannon, Weston and Clarksburg were represented, there being altogether twenty-six young ladies present. Fairmont was represented by Supt. J. Walter Barnes, Misses Elizabeth Kinkead, Edith Pickett and Nola Arnett.

At the morning session at 10:30 o'clock matters pertaining to the interests of the company were considered, different subjects were discussed of relative value to the service, and an opportunity was given for the operators to become better acquainted with one another. At the conclusion of the morning session the girls, escorted by Supt. J. Walter Barnes, went to the Waldo Hotel, where an elaborate dinner was served. All expenses of the convention, dinner, outing, etc., were defrayed by the telephone company.

In the afternoon the operators went to the park and had an outing. On their return in the evening another session was held and adjournment was made. The convention was in every way a success, and was quite enjoyable to all who attended.

TROLLEY ROAD ADOPTS TELEPHONE SYSTEM.

THE Cleveland, Painesville and Ashtabula Railway, an electric traction line running through Northeastern Ohio, has a telephone device that is new to that section of the country. At various points along the line miniature switchboards are fixed to the poles that support the trolley wires at such a height that they can easily be reached from the doors of the cars. Each car carries a portable telephone instrument. To call the dispatcher's office for orders it is only necessary for the cars to stop at one of the poles where the instrument can be plugged in, when the conductor is able to call up the dispatcher and talk without leaving the car. The system is said to be a great improvement over the old way of having the instrument attached to the pole some distance from the track.

NEW SWITCHBOARD FOR TIFFIN INDEPENDENT COMPANY.

THE Home Telephone Company of Tiffin, Ohio, is installing a modern lamp signal central energy switchboard with an installed capacity of 1200 and an ultimate capacity of 2,200. The rapidly increasing Independent telephone business in this locality has led to this valuable innovation.

It is confidently expected by the officers of the company that these and other improvements which are being made will make this exchange one of the most up-to-date in the Independent field. Every effort is being bent toward the early completion of the work as the number of new contracts awaiting service is increasing rapidly.

MEETING OF THE CITIZENS' TELEPHONE COMPANY.

THE report of Secretary Fisher of the Citizens' Telephone Company of Grand Rapids, Mich., shows a heavy increase in business for the last year. The net gain in telephones for the year was 2,357, and the Sparta exchange was annexed during the period and has become an important part of the system, which now controls 1,116 miles of wire for its toll system, 1,471 miles of copper metallic circuits, and 982 miles of iron metallic circuits, making a grand total of 2,453 miles of toll circuits with 4,906 miles of wire.

The number of city telephones in service is 5,605, the total Grand Rapids connections 328,168, an increase of 39,596 over the preceding year. The total amount of stock outstanding is $1,609,280.

It was announced that the company had purchased the telephone system at Allegan, which includes that city, Hopkins Station and

Digitized by Google

Otsego, giving eighty-three miles of new toll lines. No additional improvements were recommended for the coming year.

The following officers were re-elected: President, Charles F. Rood; vice-president, Edward Fitzgerald; secretary, E. B. Fisher; treasurer, William J. Stuart; directors, Philip Graham, Robert D. Graham, C. E. Perkins, L. J. Rindge, E. G. Studley, J. B. Ware and Gaius W. Perkins; executive committee, President Charles F. Rood and Secretary E. B. Fisher *ex-officio* members; E. G. Studley, C. E. Perkis and R. D. Graham.

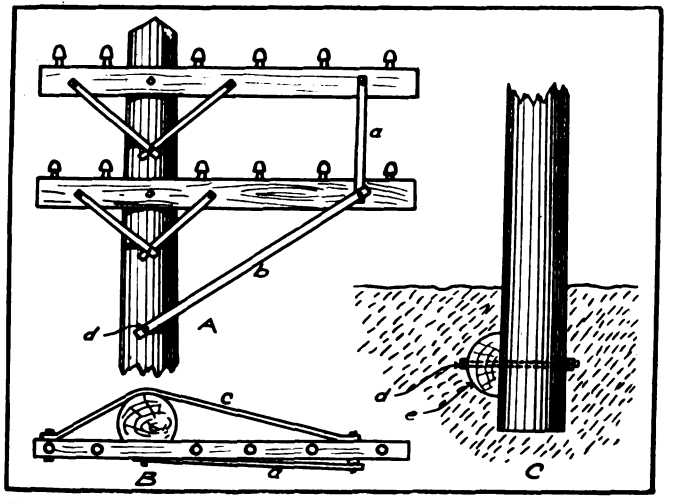
No change was made in the active management of the local exchange, the officers reappointing General Manager C. E. Tarte, Superintendent of Construction Albert Stacey and Superintendent of Equipment Edmund Land.

CONSTRUCTION STARTED ON SAN DIEGO INDEPENDENT SYSTEM.

THE Home Company of San Diego has started construction work on the new telephone system. Bids for the construction of an exchange building will be called for within a short time. Underground conduits are being laid in all the principal streets. Construction on pole lines for suburban connections are being done as fast as possible, so that when the exchange is ready for operation there may be as little delay as possible in making connections with subscribers.

SPECIAL CONSTRUCTION.

SPECIAL methods of construction are often necessary to overcome difficulties in line work. In the accompanying figure is illustrated the correct method of fastening cross-arms where the line wires are liable to interfere with trees. The method of bracing the cross-arms is shown in figures *A* and *B*,



If the work is carried out as shown, the cross-arms will be as secure as if they were spaced in the ordinary manner.

In Fig. *C* is shown the application of what is termed a *key*, which is often used in conjunction with the above method of placing cross-arms to prevent the pole being pulled over by the strain of the wires, and thus neutralizing the advantages which are sought to be gained.

NEWS FROM TORONTO.

AT a recent meeting of the Board of Control of Toronto it was decided that any Independent company which wished to secure a franchise must make an initial cash deposit with the city of $100,000. This is subject to reduction to $50,000, at the rate of $10,000 for every $100,000 expended in the installation of a plant, a final reduction to $25,000 to be allowed as soon as $1,000,000 has been expended on the plant. The $25,000 will remain on deposit at 4 per cent. interest, as a permanent guarantee that the contract will be carried out.

The Board decided to recommend that the contract be for a period of seven years instead of five years, thus allowing the company two years for the installation of enough of their plant to operate for 3,000 to 4,000 telephones. Provision is made for renewal of contract for five-year terms.

Another important condition is that which provides for the payment to the city of 5 per cent of the revenues of the company.

In the provision for the sale of the company's plant to the city, it is set forth that the company shall receive 10 per cent. additional to the valuation of arbitrators, if the company has been operating only five or seven years, but nothing additional shall be added if the franchise has obtained for longer than seven years.

TELEPHONES IN PERSIA.

THAT the rapid march of progress is not only Westward, but Eastward as well, is evident from the usage of the telephone in far off Persia.

Conditions in Oriental countries are often of such a nature as to permit the use of the telephone where the telegraph would not be considered. Asiatics generally are of a very secretive nature, consequently no amount of argument will convince them that the telegraphic message is considered secret. In the case of the telephone this is different, and consequently it is coming into great favor.

Teheran, the capital, and Ispahan, the largest cities in Persia, have telephone systems which are operated by a Belgian company, the apparatus being of either Russian or Belgian manufacture.

PRAISE FOR UTAH INDEPENDENT COMPANY.

A NUMBER of subscribers of the Utah Independent Telephone Company, of Salt Lake City, Utah, have been interviewed in reference to the efficiency of the service given them by this concern. They spoke in the highest terms of the new enterprise, and seemed highly pleased with the service rendered in comparison with the Bell Company.

THE CUMBERLAND AT PRINCETON, IND.

GENERAL dissatisfaction against the Cumberland Company at Princeton, Ind., has caused the city council to order the wires and poles of that company torn down unless it applies for a franchise. Since June 23d the company has been operating without one, and it is the general opinion that it intends to await the decision at Evansville before making an application. As it is apparent that it will be ousted from Evansville, which is the metropolis of southern Indiana and northern Kentucky, a Cumberland franchise would be almost worthless in any of the smaller cities.

The city of Princeton has also notified the Cumberland company that the franchise to do business in Princeton is worth $1,000 a year. Princeton has 8,000 inhabitants, and is now a rapidly growing city since the discovery of oil there in great quantities. It has an Independent telephone system with 220 miles of poles. The subscribers to the Independent company outnumber the Cumberland's list three to one. It is stated that if the Cumberland company refuses to pay $1,000 for the franchise that the Independent company there will make a contract with the city for that sum in return for an exclusive license.

NEW SUBSCRIBERS FOR CUYAHOGA.

THAT the citizens of Cleveland appreciate the new system installed by the Cuyahoga Company is evident from the fact that since the new switchboard has been in operation over 2,450 subscribers have been added to the list. This is an average of 21.35 per day, including Sundays. During the month of June the average of daily installation of new connections had increased to 24.64.

EXTENDING TOLL LINES IN OKLAHOMA.

A MEETING of the members of the Southwestern Telephone Association was recently held at Wichita, Kans., and ways and means were discussed for increasing the toll line systems of Oklahoma. The meeting was a quarterly gathering, and consisted of two sessions, one held during the morning and one in the afternoon. About fifty managers of Independent telephone lines in Oklahoma and Kansas were present.

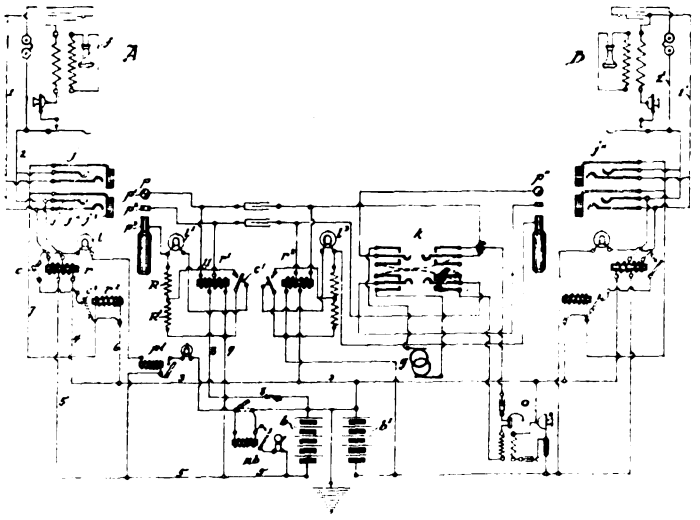
TELEPHONE PATENTS

TELEPHONE EXCHANGE SYSTEM.

J. P. Downs, of Cleveland, Ohio, patents (No. 765,822) and assigns, by mesne assignment, to John F. McDonnell, of Cleveland, Ohio, a telephone exchange system. This invention relates to improvements in common battery telephone exchange circuits. The objects are to reduce or obviate the objectionable click in the receivers, to render the system more economical by reducing current consumption, to make the relays more positive in action and to balance the circuits more accurately. The results are obtained by maintaining a closed battery circuit when the same is once established through the subscriber's set, and by shunting into the circuit the additional relays and other pieces of apparatus, and by opening, instead of shunting, the supervisory signal circuits. The circuit is shown in the accompanying illustration. When the subscriber removes his receiver the circuit is closed from positive side of battery through conductors *3*, *4*, one-half of the



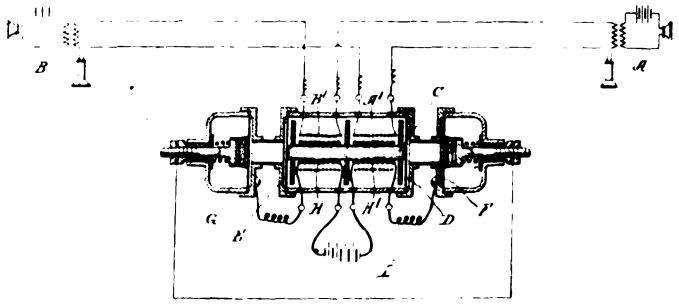
relay *r*, conductor *2*, through substation conductor *1*, other half of relay *r*, conductor *5* to positive poles of battery. The line relay is energized, closing the lamp circuit at *c*. The circuit through the supervisory *r'* controlling the lamp *l'* will be closed through tip and sleeve *p' p2* by contact with springs *j1 j2*, the relay is excited and opens the normally closed lamp circuit at *c'*, thereby extinguishing the supervisory lamp *l'*. Current flows from positive pole of battery *b* over conductor *8* to half of relay *r'*, tip of plug, substation instrument, conductor *1*, sleeve *p2* and other half of relay, conductors *9* and *5*, to positive pole of battery. Lamp relay *r2* is energized, opens circuit of signal lamp *l* at contact *c2*. Circuit being from positive pole of battery *b*, conductors *3* and *6*, through winding of relay *r2*, conductor *7*, test ring resistance *R* and parallel with *R'*, conductor *11*, conductors *9* and *5* to negative pole. The rest of the circuit can be easily traced.

IMPROVED TELEPHONE DIRECTORY.

F. Drowns, of Malden, Mass., patents (No. 763,093) an improved telephone directory This device consists in placing underneath the rubber mouthpiece fastened to a transmitter a circular paper disc upon which the names of the frequent subscribers are printed, thus forming a proper directory.

TELEPHONE REPEATER

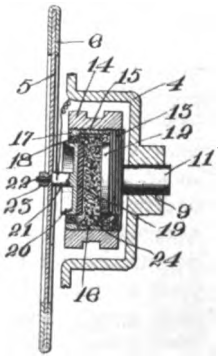
D. H. Wilson, of Chicago, Ill., patents (No. 766,155) and assigns to George W. Kretzinger, of Chicago, Ill., a telephone repeater. The object of this invention is to provide a telephone repeater which is arranged as shown in the accompanying illustration, in which there is a core, *C*, upon which is wound a coil, *A'* and a coil *B'*, these coils being connected in the main line which connects the instruments *A* and *B*. The line is continuous from one set of instruments to the other, and one of the coils is in one branch of the line and the other in the other branch. The telephone receivers *D* and *E* are associated with the core *C* that



forms the controlling magnets for the receiver diaphragms. Opposite to the receivers are the transmitters F and G, arranged to receive the sound waves from the receivers. A primary coil is wound upon the core *C* and connected to the transmitters *F* and *G* and is made of two sections *H* and *H'*, the battery being connected between the two sections. Thus messages can be transmitted in both directions over the same line. When station *A* is being used current passes through coils *A'* and *B'* energizing core *C* and causing the receivers to be operated. They act upon the transmitters and vary the current through the sections *H* and *H'*, which induces the current in *A'* and *B'*. Receivers *D* and *E* work simultaneously when both are used, also the transmitters *F* and *G*. It will be seen by this construction that the talking current is reinforced by means of the repeater.

TELEPHONE TRANSMITTER.

D. C. Jackson, of Madison, Wis., patents (No. 764,055), a telephone transmitter. This invention relates to improvements in microphonic transmitters and is illustrated in the accompanying figure. The inventor provides a threaded collar *14* into which the electrode *13* is screwed. This is the rear electrode, and is supported by the bridge *4*. The front electrode *19* is attached to



the plunger *20*, which is fastened to the diaphragm. This plunger is surrounded by a fibrous packing *18* which prevents the granules which are retained between the two electrodes from escaping from the chamber which is formed by the two electrodes and the collar *14*.

SELECTIVE SIGNALLING SYSTEM.

William M. Davis, Chicago, Ill. Patent No. 766,224. Assigned to Stromberg-Carlson Telephone Mfg. Co. An Improved Selective Signalling System.

We have recently had occasion to notice a patent granted to Mr. Davis for selective signalling system based upon providing at the central office various kinds of current, such as alternating current of various frequencies, and direct pulsating current, positive and negative.

The patent now under consideration is an extension and addi-

Digitized by Google

tion to the former patents, and relates entirely to the method of arranging the sub-stations so that they shall be responsive to the various kinds of currents. Mr. Davis secures this result by "ringing ground and talking metallic," and by placing the stations either on one side or the other of the line, and by supplying them with various combinations of condensers and inductance coils, so that the different stations shall be receiving a different kind of current.

TELEPHONE SYSTEM.

William M. Davis, Chicago, Ill., patents (No. 766,223) and assigns to the Stromberg-Carlson Telephone Mfg. Co., Rochester, N. Y., an improved telephone system.

This invention is shown in the accompanying illustration. At the sub-station the inventor provides an induction coil, whose windings, *3* and *4*, are placed in series with the transmitter *2*, while the receiver *1* is arranged as shunt around the winding *4*. There is the usual ringer *6* and condenser, the hook switch *5*

Fig 2.

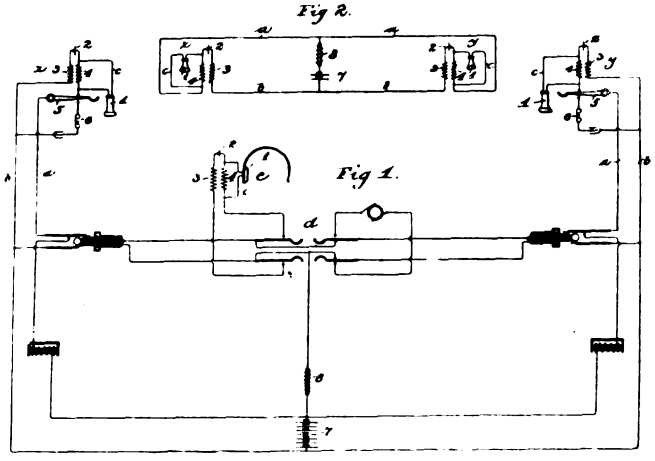


Fig 1.

being arranged to close the ringing circuit when in its lower position and open it when the receiver is removed, while the talking circuit is thus closed. A common battery, *7*, is provided with a retardation coil, *8*, as shown. The inventor claims that by this arrangement of the receiver, transmitter and windings of the induction coil, which are respectively equal in resistance, improved transmission is obtained.

TELEPHONE BOX.

Charles C. Hughes, Baltimore, Md., patents (No. 766,354) an improved telephone box.

The object of this invention is to provide an improved mechanism in which the sub-station apparatus may be enclosed. The inventor assembles the apparatus, such as the hook switch, transmitter, etc., upon the cover of a box. The box has no bottom but is secured to the wall, and inside thereof the circuits are brought in and terminated. The cover and the box are provided with knife switches so arranged as to operate both to close the circuits and to secure the cover to the box.

SERVICE-METER FOR TELEPHONE EXCHANGES.

James L. McQuarrie, South Orange, N. J., patents (No. 766,375) and assigns to Western Electric Company, of Chicago, Ill., an improved telephone service meter.

The object of this invention is to provide a service meter so arranged that the subscriber can contract for a certain predetermined number of messages, which the meter will automatically record, and that after the pre-arranged number has been exhausted the meter will register the excess number of messages and notify the central offices thereof. This invention is shown in Figs. 1, 4 and 5, in which Fig. 1 is a front elevation, Fig. 4 a section, and Fig. 5 the switchboard circuit. In Figs. 1 and 4 there is a counting train, *a*, which is operated step by step by a pawl-and-ratchet mechanism actuated by manual push button, *b*. In connection therewith is a gear-train, which is advanced step by step as the counting train is moved. The push-button *b* operates the lever *b'*, carrying the pawls b^2 b^3 that operate the counting and gear train. The lever *b'* is held normally in a retracted position by spring *c*. The ratchet wheel *d* of the gear-train is actuated by the pawl b^3 and carries a pinion, *d'* which meshes with the large gear wheel *e*. As the counting train is advanced step by step the gear train is rotated.

An insulating stud, *f*, carried upon gear wheel *e* engages contact spring *g* and separates it from the contact-anvil *g'*, when the gear wheel reaches a predetermined point in its rotation. A pair of contact springs, *h h'*, are normally closed by an insulating stud, *k*, carried upon the lever *b'*. When the push-button *b* is operated the stud *k* is moved and spring *h* raised by its own elasticity. A gong, *1*, is provided, having a tapper, *1'*, actuated by the ratchet wheel *d*, so that each time the button *b* is pressed the counting train is advanced *1* step and the gong *1* is struck. The central office circuit has no peculiarities.

The subscriber manually operates his service-meter and records each call by the push-button. When the service meter is actu-

Fig 5.

Fig 1.

Fig 4.

ated gong *1* is sounded and can be heard at the central office, so the operator knows from hearing the gong that registration has been duly made. When button of service meter is pressed both shunts *6* and *7* open and buzzer *m* is included in the circuit. After the full terminal number of calls have been made the stud *f* is advanced till it engages spring *g* and opens shunt *6*. The buzzer is then transversed by current, and so transmits a signal which will be heard by both the operator and subscriber. This signal indicates that further service will be in excess of predetermined number of calls.

TELEPHONE APPARATUS.

Christian Hülsmeyer, Düsseldorf, Germany, patents (No. 766,355) an improved telephonogram apparatus.

The object of this patent is to produce an improved apparatus for the transmission of signals by means of a beam of light. The essence of the invention consists in providing a mirror, which is mounted upon the armature of an electro-magnet, so that the mirror shall oscillate with any change in the magnetic field, said changes being produced by a sound as in a telephone receiver. In the path of the beam of light a slit or aperture is provided in an opaque plate, so that as the beam vibrates more or less rays will pass through the slit, depending upon the position of the mirror. At the receiving station any form of device which is sensitive to light, such as a selenium cell, may be employed as a receiver.

Digitized by Google

THE WEEK'S MESSAGES

FINANCIAL.

BIRMINGHAM, ALA.—A special meeting of the People's Home Telephone Company has been called for September 1st for the purpose of voting on a proposition to cancel the present authorized issue of bonds of $100,000 and to authorize instead an issue of $200,000 first mortgage 5 per cent. 20 year gold bonds to be secured by trust deed of all the company's property and franchises. The proceeds of this issue of bonds will be used to pay off the present indebtedness of the company and provide funds for future extensions of their plans.

CHICAGO, ILL.—The Runzel Lenz Electric Manufacturing Company has been organized to manufacture switchboard cables and telephone and switchboard cords.

JACKSONVILLE, ILL.—The Illinois Telephone Company has increased its capitalization from $100,000 to $500,000.

PALO, MICH.—The Palo Telephone Company has increased its capital stock from $6,000 to $10,000. The new money will be used in extending rural lines.

CLEVELAND, OHIO.—The better feeling toward Independent telephone securities on the Cleveland stock market was noted last week. It is said that this is more marked at present than for a long time.

ELECTIONS.

SAVANNAH, GA.—At the recent annual meeting of the stockholders of the Georgia Telephone & Telegraph Company, officers were elected as follows: President and general manager, W. A. Bisbee; vice-president, J. H. Estill; treasurer, C. S. Kenyon; secretary, W. V. Davis.

FRANCHISES.

TORONTO, CANADA.—Tenders for a telephone franchise will be received on or before October 1st.

CARRABEIL, FLA.—Mr. W. C. Lewis, of the First National Bank of Tallahassee, and Dr. Moore, of Tallahassee, have been granted a franchise by the local city council to construct a local system with long distance connection with Thomasville, Georgia, and Tallahassee.

SO. McALESTER, IND, TER.—The Schooler Brothers have been granted a franchise to operate a common battery telephone system in this city, in competition with the old telephone system.

EDWARDSVILLE, ILL.—E. W. Burroughs, Albert Miller, George C. Stullken and others have petitioned the supervisors of Madison County for franchise over the public highways of the county.

PARKER, KANS.—The Parker Telephone Company has been granted a franchise and will install a local telephone exchange. It is capitalized at $2,000.

PRESQUE ISLE, ME.—The Farmers' Telephone Company, of Robinson, has been granted a franchise by the selectmen.

SKOWHEGAN, ME.—The Somerset Farmers Co-operative Telephone Company and the Central Main Telephone Company have both petitioned the selectmen for local franchises. The Farmer Company is an Independent line and the latter company has the direct backing of the Bell Telephone Company. It was organized on account of the success of the Farmers' Company. It is thought that the Independent company will be granted the franchise.

WILLMAR, MINN.—The Tri-State Telephone Company was granted the right to run a line through town and install a pay station.

OMAHA, NEB.—The city council had decided to defer consideration of the matter of granting a franchise to an Independent telephone company for two weeks.

HIGHSTOWN, N. J.—The Farmers' Telephone Company has applied to the city council for a franchise.

GRANDVILLE, N. Y.—The Grandville Telephone Company has declared a semi-annual dividend of 3 per cent, the balance of the earnings were added to the surplus account. Two hundred and sixty new telephones have been installed in the past year. The old officers and directors were re-elected.

OWEGO, N. Y.—The York State Telegraph Company is endeavoring to establish an exchange here by means of the franchise granted the Binghamton Telephone Company to stretch a wire or cable through such street or streets as the village may allow and under the supervision of the trustees.

FARGO, N. D.—The Tri-State Telegraph & Telephone Company has petitioned the village of Fargo for a franchise giving it the right to build its lines through the village.

COLUMBUS, OHIO.—The Citizens' Telephone Company has increased its capital stock from $750,000 to $1,250,000.

EASTON, PA.—The Easton & Bethlehem Telephone Construction Company has petitioned the borough council of Fountain Hill for a franchise.

BONHAM, TEX.—The city council has granted a franchise to the Phenix Telephone & Telegraph Company. Twenty-five or thirty telephones will be installed at once.

COMBINATIONS.

WINSLOW, ILL.—The Freeport Telephone Company's plant in Winslow has been purchased by Crosby & Blaisdell, who will connect it with their extensive system.

HERON, ILL.—The Farmers' New Era Telephone Company recently organized, has purchased from the Citizens' Telephone Company the line in Alden and Hebron Townships and the north of Greenwood Township. The exchange will be installed at Hebron. Geo. Hunt is president of the company.

LOSANTVILLE, IND.—The Parker City Telephone Company has purchased the local telephone plant from A. L. Cox for $1,200.

PETERSBURG, IND.—P. K. Heuring has sold his interest in the Independent telephone company to C. H. Webb.

SLAYTON, MINN.—Geo. H. Woodgate, of Slayton, has purchased a telephone line running from this place to Cameron Township from F. F. Robinson. Mr. Woodgate intends to connect the line with Hadley and Slayton.

MORRISTOWN, TENN.—The property and franchise of the Citizens' Telephone Company, of Morristown, will be sold on September 12th under a deed of trust to secure J. W. Fisher a note for $7,000.

LA CROSSE, WIS.—The La Crosse Interurban Telephone Company has purchased the Barre Telephone Company's plant.

PERSONAL.

MR. BROWN, electrical engineer, of Indianapolis, Ind., has charge of the work of installing the new switchboard of the Home Telephone Company in Tiffin, Ohio.

EDWARD ERB has been appointed manager of the Wisconsin Telephone Company's exchange at Racine.

J. W. GLASS has been appointed superintendent of construction for the Pacific States Telephone Company, at Oakland, Cal.

MR. E. M. JENKINS has been appointed manager of the Wabash Telephone exchange at Vincennes, Ind.

GREGORY McINERY has been appointed manager of the Central Union exchange at Savanna, Ill.

J. W. SMITH has been appointed manager of the telephone plant of the Union Electric Company, at Moline, Iowa.

W. B. THOMPSON has been appointed manager of the Home Telephone Company at Hamilton, O.

NEW COMPANY NOTES.

BELVIDERE, ILL.—The Boone County Telephone Company has been incorporated with a capital stock of $2,500. The incorporators are F. W. Plane, I. W. Barningham and S. Hicks.

FARMINGTON, ILL.—The Farmington Telephone Company has been incorporated with a capital stock of $1,000. The incorporators are: J. W. Connelly, F. S. Vandesloot and A. H. Fash.

OCOYA, ILL.—The Eppard's Point Telephone Company has been incorporated with a capital stock of $2,500, by W. E. Fisk, W. W. Osborn, W. Wagner.

ST. JOSEPH, ILL.—J. J. Woodin, of Louisiana, is in St. Joseph arranging for the installation of a telephone system. The St. Joseph Telephone Company has been organized and will be incorporated. It is backed by prominent residents of this town.

IDAVILLE, IND.—The Idaville Co-operative Telephone Company has been incorporated to give telephone service in this vicinity. The officers of the company are W. Pearson, Delphi, president; T. B. Grime, Idaville, vice-president; J. Reff, Idaville, treasurer; L. Read, Idaville, secretary; F. Roger, Idaville, manager.

CYPRESS, IND.—The Cypress Independent Telephone Company has filed articles of incorporation with the county recorder. The capital stock is $8,000. The directors are: John F. Edmund, president; John A. Neal, secretary and treasurer; Edgar S. Levy and L. B. Sinkle.

MANNING, IA.—The Manning Telephone Company has been incorporated with a capital stock of $2,500, by W. B. Swaney and others.

LAWRENCE, KANS.—The Lawrence Home Telephone Company has been incorporated with a capital stock of $125,000.

HENDERSON, MINN.—The Henderson Telephone Company has been incorporated with a capital stock of $10,000, by Hans Ems, W. H. Leeman, Lionel A. Guilbert, John F. Dempsey, Phil. J. Hemler, Allois W. Heberle, August Ney, Alfred C. Blasing and William N. Theissen.

ST. PAUL, MINN.—The United States Railway Signal & Telephone Company has been incorporated with a capital stock of $1,000,000. It will manufacture the Johnson-Ballard electric signals. The incorporators are: James A. Ballard, Horatio A. Johnson, and Angelo H. Sprague.

KEARNEY, NEB.—The Kearney Telephone Construction Company has been incorporated with a capital stock of $100,000.

HENNIKER, N. H.—The Henniker Telephone Company has been incorporated with a capital stock of $40,000.

COLUMBUS, OHIO.—The Franklin County Telephone Company has been incorporated with a capital stock of $150,000. The incorporators are: Isaac B. Cameron, Seth L. Rose, Charles F. Johnson and Ralph Reamer.

TURIN, OHIO.—The Hahne Telephone Company has been incorporated. It will have headquarters in Turin.

BEMD, ORE.—The Deschutes Telephone Company, of Bemd, has been incorporated with a capital stock of $3,000 by P. L. Tompkins, George C. Steineman and W. E. Guerin, Jr.

JUNCTION CITY, TEX.—The Junction City Telephone Company has been incorporated with a capital stock of $5,000, by T. B. Phillips, M. E. Blackburn and T. J. Bailey.

CAMBRIA, WIS.—The Cambria Co-operative Telephone Company has been incorporated with a capital stock of $1,000, by H. W. Thomas, C. Hecker and E. D. Lord.

HUDSON, WIS.—The Hudson Prairie Telephone Company has been incorporated with a capital stock of $3,000, by George Turner, Arthur McDiamid and G. E. Holden.

MISCELLANEOUS.

POINT ATKINSON, B. C.—It is reported that a telephone line will be built from here to Vancouver.

Digitized by Google

WASHINGTON, D. C.—The cabinet at a meeting this week discussed the advisability of the Government installing its own telephone system in Washington. The local Bell Telephone Company is preparing to raise its rates and several of the cabinet officers called attention to the company's demands. The cabinet finally placed the matter in Secretary Morton's hands for investigation. Some of the officers thought it would be cheaper for the Government to construct and operate the inter-department telephone system.

ORLEANS, IND.—The Hoosier Telephone Company has installed a new switchboard.

PORTLAND, IND.—The Bryant Telephone Company has severed connections with the Bell Company and secured toll connections with the United Telephone Company.

PRINCETON, IND.—The Independent exchange at Princeton, Ind., is quarantined on account of a case of smallpox which developed while one of the operators was in the office. The remaining girls, six in number, will be compelled to stay in the building for ten days. Arrangements have been made for sleeping and eating quarters in the rest room of the building.

CITY OF MEXICO, MEX.—James Menzies, of Boston, is completing arrangements for a telephone system here.

HART, MICH.—Since the first of May over 100 new telephones have been added to the Hart exchange of the Lake Shore Telephone Company. Fully half of the newly installed telephones are in farm houses.

SARANAC, MICH.—The Saranac Telephone & Improvement Company has decided to construct lines out of the village. The first line will run north, and work will be commenced as soon as enough contracts can be secured.

BENBORO, MO.—W. A. Clow has completed a new telephone line from here to Ewing. The line has ten subscribers and is thirteen miles long.

KANSAS CITY, MO.—The Home Telephone Company has petitioned the county court to put its telephones in the county offices.

MEXICO, MO.—The Union Telephone Company has installed a new switchboard here. This company now owns exchanges at Laddonia, Rush Hill, Benton City, Worcester and Mexico.

MILTON, MO.—The Milton Telephone Company has installed a new switchboard recently. The capacity now is 300 lines, not including the country lines.

RICHMOND, MO.—The Richmond Telephone exchange has recently been connected to Kansas City. The Home Telephone Company furnished the capital.

NEW LONDON, MINN.—The New London Central Telephone Company has completed its system. A hundred line switchboard has been installed with Stromberg-Carlson instruments.

LINCOLN, NEB.—The Automatic Telephone Company is making large additions to the number of its subscribers by means of well placed newspaper advertising.

ALLIANCE, OHIO.—The Starke County Telephone Company suffered a loss of about $7,000 by the partial destruction of its switchboards through fire. The origin of the fire is not definitely known but is thought to have been caused by the contact with high tension circuits.

PITTSBURG, PA.—The Pittsburg & Allegheny Telephone Company has recently received a shipment of over 200 pole cable terminals and 100 more are ready for shipment. The company is using some of these terminals for its McKeesport exchange, the balance being for some of its other exchanges.

YANKTON, S. D.—At the meeting of the county commissioners a resolution was adopted giving the Independent Telephone Company, of Yankton, permission to use the roadways through the county for the purpose of setting poles for a long distance telephone line. The president of the company is E. A. Bruce, and J. J. Wagner is secretary.

BRIDGEPORT, W. VA.—The Belmont Telephone Company is arranging to secure toll connections with all points in Ohio.

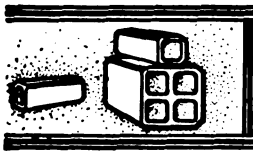
RACINE, WIS.—The Citizens' Telephone Company now has over 2,000 telephones in operation.

UNDERGROUND.

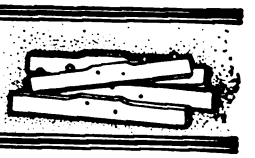
LEAVENWORTH, KANS.—The city council has granted a new franchise to the People's Telephone Company for twelve years. The company agrees to place its wires underground in the business portion of the city and to make improvements amounting to about $30,000.

MOUNT CLEMENS, MICH.—The local telephone company is placing its wires underground.

DOYLESTOWN, PA.—The Delaware & Atlantic Telephone Company will install underground conduit system in Doylestown.



New Construction in the Field



LOS ANGELES, CAL.—The Home Telephone Company is building a line from Pasadena that will connect with the Home system at Glendale.

RIVERSIDE, CAL.—Work will be started on the new Independent exchange about September 15th.

SINCLAIR, ILL.—The Lighter-Arcadia Telephone Company is constructing another line from Sinclair to Yatesville.

QUINCY, ILL.—The Adams Pike County and Hannibal Telephone Company has been incorporated with a capital stock of $7,000, by Wm. H. Breckenridge, John W. Buttz, Samuel S. Inman and Charles H. Rankin.

VIRDEN, ILL.—The Kinloch Telephone Company is erecting a telephone line in this town.

IONIA, IA.—The Interstate Telephone Company will construct a line from this place to Nashua.

MOLINE, IA.—The Union Electric Co. is planning a number of extensions and improvements to the telephone system.

SPENCER, IA.—The Spencer Telephone Company has commenced work on its system.

WAVERLY, IA.—J. W. Bangs, of Cedar Falls, and C. H. Varrows are canvassing for subscribers and making arrangements for the construction of several rural lines in this vicinity. Very advantageous terms have been made for the connection with the U. S. Telephone Company's central office in this city.

BOWLING GREEN, KY.—The Home Telephone Company is building a line to Smith's Grove.

CORTLAND, ME.—The Northeastern Telephone Company has arranged to install an exchange at Windham.

GRAND RAPIDS, MICH.—The city has authorized General Superintendent Meyer of the Board of Public Works to prepare plans and estimates of the cost of installing a telephone exchange for the use of the department.

OCEANA, MICH.—The Lake Shore Telephone Company will install an exchange at Pentwater.

BENSON, MINN.—The Tri-State Telephone Company has completed the line to this point which is to run from St. Paul to Grand Forks.

FAIRMONT, MINN.—A telephone line is to be constructed by the farmers east of this place.

FRANKLIN, MINN.—A local telephone company is building a line south on Lone Tree.

GLENCOE, MINN.—The Norwood-Young America Telephone Company is making a number of extensions, including a line to Coney Island.

BOVINA, MO.—The Mutual Telephone Company, of this place, by a meeting held recently, decided to purchase a new switchboard, to be installed at once.

ST. JOSEPH, MO.—The Seneca Telephone Company is reconstructing its pole line here.

BIG TIMBER, MONT.—The Northern Telephone Company is extending its system to take in all the ranch country north of the Yellowstone Park.

CHAPMAN, NEB.—The Independent Chapman Telephone Association is preparing to construct lines to Archer and Prairie Creek. Lines are contemplated to other parts of the country to connect with other Independent systems.

ST. JOHN, N. B., CANADA.—The New Brunswick Telephone Company is constructing a line from Grand Falls to Edmunston and one from St. John to Fredericton. A new line will probably be constructed from Fredericton to Chatham.

LAWTON, N. D.—Lawton citizens intend to put in a telephone exchange.

ELMIRA, N. Y.—The York State Telephone Company is building a line from here to Binghamton by way of Spencer, Owego and Union.

DARIEN, N. Y.—The Darien Telephone Company has connected the Corfu Exchange with East Pembroke. Two other lines to Darien, and a third to Alexander are contemplated.

MARION, N. Y.—The Wayne-Monroe Telephone Company has secured thirty contracts in this village and will establish a local exchange.

PINGREE, N. D.—Buchanan Brothers are building a telephone line from Jamestown to Buchanan.

ADAMSVILLE, OHIO.—The work of completing connections between here and Janesville by the United States Long Distance Company is nearly finished.

HAMILTON, OHIO.—Manager Thompson, of the Hamilton Home Telephone Company, announces that the company will entirely rebuild the Scipio line in the near future. This line was purchased from the Scipio Telephone Company.

OXFORD, OHIO.—The Oxford Telephone Company has contracted with the Miami University to install a private branch exchange with twenty-two telephones and two trunk lines connecting with the Oxford exchange.

TOLEDO, OHIO.—A meeting of the directors of the Peninsular Telephone Company, of Tampa, Florida, was held recently at the office of the I. H. Detwiler Company. A proposition for enlarging the system was closed and another proposition for the extension of toll lines in connection with other systems was taken up.

DUSHORE, PA.—The Sullivan & Wyoming Telephone Line and the Sullivan County Telephone Line have agreed to establish a union exchange at Dushore.

INDIANA, PA.—At a meeting of the Farmers Telephone Company it was decided to string a line from Indiana to Plumville and Punxsutawney, Lines between Penn Run and Indiana, Uniontown ad Cookport, Coolspring and Knoxdale and Cookport and Douglas became members of the company. The company's system now embraces about 800 miles of lines in Indiana, Jefferson and Armstrong Counties. Several new lines are in course of construction.

READING, PA.—The Conestoga Telephone Company has completed its line to Birdsboro by way of Morgantown, White Bear, Churchtown, Geigertown, Joanna and Elverson.

PHILADELPHIA, PA.—The Pennsylvania Railroad will use the telephone in its block signal system on the new West Philadelphia line instead of the telegraph.

PHILIPSBURG, PA.—The Huntington and Clearfield Telephone Company has built a line from Peale to Snow Shoe to connect with the lines of the United Telephone and Telegraph Company.

LAKE PRESTON, S. D.—A new rural telephone line is being constructed from this place north and west of town. It is said another line will be built to the farming community west and south.

BRYAN, TEX.—Stephen Moss, J. O. Tucker, and E. E. Wilson are constructing a new line from Bryan to connect with Wheelock, Henry Prairie, and other towns. It will connect with the Franklin line.

EDGE, TEX.—The stockholders of the local telephone company are preparing to improve the line which extends from Edge to Bryan, a distance of eighteen miles.

LOCHHART, TEX.—The Commercial Telephone Company has arranged to install a telephone system in this city.

MACY, TEX.—Marvin Hunt, of this place is rebuilding his local telephone line.

MONTPELIER, VT.—A meeting of the Montpelier Telephone Company was held recently and plans were discussed for the construction of a line. The poles have been set for some time, but the wires have never been strung. It is thought now that the work will be pushed forward to completion.

WINCHESTER, VA.—T. H. Nevitt, of Harrisburg, Pennsylvania, chief engineer of the United Telephone & Telegraph Company, is here making final arrangements preparatory to erecting an entire new plant in this city. A new switchboard will be installed and all wires run in cables.

WHEELING, W. VA.—The Belmont and National Telephone Companies will extend their lines to Galord. Quite a large number of subscribers have been secured along the line.

Digitized by Google

TRADE NOTES

THE F. BISSELL COMPANY, of Toledo, Ohio, has published a new and complete bulletin on wire that is up to date in every respect. This bulletin will be mailed to any telephone company upon request.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Chicago, Ill., reports that times have never been better for this season of the year, and it is with difficulty that it is able to keep up with orders.

JULIUS ANDRAE AND SONS COMPANY, of Milwaukee, Wis., has recently issued a new catalogue. This catalogue is up to date in every respect and includes descriptions of all the apparatus, tools and material this company has for sale. To all parties interested this catalogue will be mailed free upon request.

THE INTERNATIONAL TELEPHONE MANUFACTURING COMPANY, of Chicago, has received an order from the corporation officers of the town of Neepawa, Canada, for a complete new telephone exchange equipment and all necessary appurtenances, construction material, cables, etc., to completely re-eqiup and rebuild the local system.

THE CONNECTICUT TELEPHONE & ELECTRIC COMPANY, of Meriden, Conn., report very large sales on their automatic intercommunicating telephone, which is now fitted for branch office exchanges with connection to city service and is adapted either for connection to local or common battery systems. The company has issued a bulletin describing this instrument which will be sent on request.

W. N. MATTHEWS AND BRO., 619 Carleton Building, St. Louis, are the distributing agents for the Stombaugh guy anchor. To interest the people at large who have any use for guy anchors, this firm has been distributing some remarkably good advertising matter in the shape of folders. The latest is entitled "Unkel Sam's Publicity Buro," by Mr. National Reputation. The phraseology is typical ot the backwoods farmer but the strength of the argument is as strong as the anchor which Mr. Reputation says "kum putty near pullin' Ithaca frum off'n the map ov Nu York." Those interested should send for the folder and find out how this happened.

THE T. AND A. SELECTIVE CALL COMPANY, of Geneseo, Ill., has recently placed on the market a selective call system which possesses some unique features. The apparatus is so designed that when attached to an ordinary generator pulsating as well as alternating current can be secured. By means of a specially designed relay at the exchange a subscriber can signal any party on a party line without calling the operator, or call the operator without signaling any of the subscribers. In tests made over lines of the Kewanee Home Telephone Company the results obtained were of the most successful character, the number of parties on a line making no difference in the operation of the apparatus. The company has gotten out a folder which illustrates and describes the apparatus very thoroughly. To companies operating party lines we would suggest their securing a copy.

THE VOUGHT-BERGER COMPANY, of La Crosse, Wis., has issued a very complete and comprehensive catalogue describing the various appliances and apparatus it makes. The catalogue is made up in the loose leaf form so that additional pages can be added as received. One very commendable feature is the shape and size, 4 x 7 inches, which makes it very convenient to carry around. Every article or appliance necessary for a telephone system is illustrated in a first-class manner, and the general design of the catalogue is such that a separate page is used for each article. Amongst the many pieces of apparatus illustrated are the various types of switchboards this company manufactures, of which there are thirteen; central energy and magneto telephones in various styles, the Pendant telephone, a type made by this firm exclusively; intercommunicating systems, hook switches, transmitters, receivers, cabinets, lightning arresters, distributing frames, heat coils, fuses, adjustaphones, pay stations, pole changers, calculagraphs, telephone booths, cable boxes, and also ball adjusters for portable electric specialties. The latter part of the catalogue contains copies of letters received from telephone companies which have been satisfied customers. This catalogue should be secured by all parties interested in the operation of telephone systems.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

A New Series of Telephone Books, entitled

"TELEPHONY"

IN SIX VOLUMES

By ARTHUR VAUGHAN ABBOTT, C. E.

Four volumes are now ready. They embrace the following subjects:

Part I.—THE LOCATION OF CENTRAL OFFICES.
170 pages, 33 illustrations.

Part II.—THE CONSTRUCTION OF UNDERGROUND CONDUITS.
190 pages, 62 illustrations.

Part III.—THE CABLE PLANT.
152 pages, 51 illustrations.

Part IV.—CONSTRUCTION OF AERIAL LINES.
263 pages, 140 illustrations.

Two remaining volumes will be ready in October (Orders taken now). They are:

Part V.—THE SUBSTATION.

Part VI.—SWITCHBOARDS AND THE CENTRAL OFFICE.

The price of each Part is $1.50, postage prepaid. The price of the entire set (six volumes) is $6.00, postage prepaid.

FREE TO OUR SUBSCRIBERS

How You can Secure the Entire Set Free:

Send us 20 **new** subscribers to The American Telephone Journal at $1.00 each, a total of $20 00. We will then send you, all charges paid, the six volumes free.

How You Can Secure One Volume Free:

Send us 5 **new** subscribers at $1.00 each, a total of $5.00. We will then mail the volume you desire free.

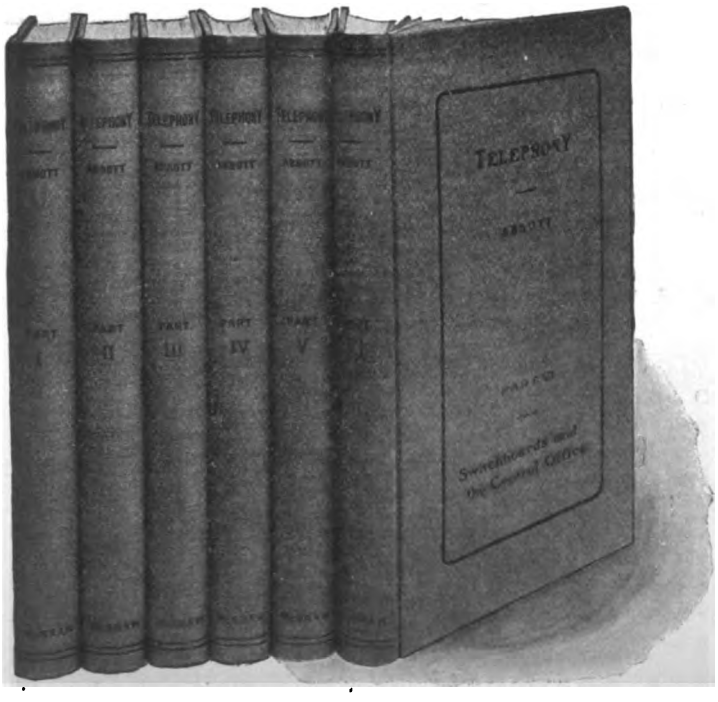
Another Way to Secure the Set:

For $7.00 we will give two yearly subscriptions to The American Telephone Journal, (one of which may be a renewal) and a complete set of six volumes.

For $7.50 we will give three yearly subscriptions, one of which may be a renewal and a complete set.

For $8.25 we will give four yearly subscriptions, one of which may be a renewal, and a complete set.

For $9.00 we will give five yearly subscriptions, one of which may be a renewal, and a complete set.



THE PUBLISHERS IN ANNOUNCING THIS NEW WORK SAY:

"There is telephone literature galore that occupies itself with the discussion of the theory of receiver and transmitter, and a description of the various forms of apparatus used in building telephone exchanges. But there is little information that concerns itself with the engineering design of telephone plants. It is the attempt of the author in this series to prepare a manual that shall deal with the latter phase of the problem, with particular reference to a consideration of the economic features, which lead to the installation of the best plant for the least money."

Advise us at once which of these propositions you intend to accept, so that we can make the necessary arrangements.

THE AMERICAN TELEPHONE JOURNAL

A New Subscriber

Who is an officer of a NEW Independent Company writes as follows:

"Some few months ago I became interested in Independent telephony and was induced to subscribe for The American Telephone Journal. It is the very best publication with the most desirable information I ever saw. No telephone manager can afford to be without it on his desk. On these lines I enclose a check for another new subscriber."

E. B. HEYWOOD,
Claremont Telephone Co.,
Claremont, N. H.

The fact that a subscriber who has been receiving the Journal less than two months, and who is engaged in a new line of work, so appreciates this paper, is, we think, one of the best recommendations of its worth, and explains its widespread popularity

***Important Notice...*THE EDITOR DESIRES TO CALL SPECIAL ATTENTION TO THE "OPEN LETTER" WHICH APPEARS IN THIS ISSUE ON PAGE 136. IT CONTAINS MATTER THAT WILL INTEREST EVERYONE CONNECTED WITH THE INDEPENDENT TELEPHONE BUSINESS.**

ANDRAE
"Giant" Telephones

Are equipped with a generator which will ring through a resistance equal to forty telephones on a 35-mile line—the most perfect generator made. The steel we use in its construction is harder to work than that in other generators and costs at least six times as much per pound; but it will last six times as long as others. At the same time our methods of manufacturing enable us to sell it cheaper than others. .. .. ..

Write for descriptive literature and prices, or better still order a sample telephone. If not exactly as represented send it back. .. ..

Our new catalogue is ready. Will be glad to mail a copy to any Telephone Company sending request.

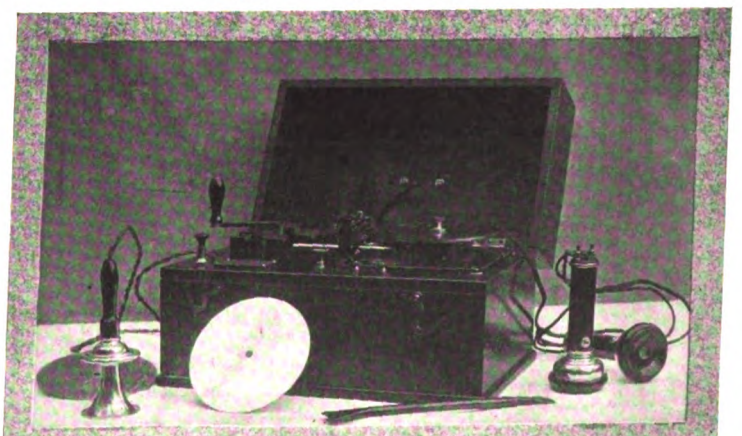
SOME NEW FACTS ABOUT THE POULSEN TELEGRAPHONE

By Dr. Alfred Gradenwitz.

Editor's Note.—The following article dealing with some recent improvements in the Poulsen telegraphone, has been specially prepared for The American Telephone Journal by Dr. Alfred Gradenwitz, who has exceptional facilities for acquiring the latest and most authentic information regarding this somewhat remarkable invention. There appear to be many cases where a record of a telephonic conversation would be of great value. In case a subscriber cannot be found it is often of great advantage to leave a message for him. In many instances business is transmitted over the telephone of which a record would, in the future, be of the greatest value to prevent misunderstandings. To achieve such a result has been the dream of many an inventor, so far, with imperfect success. The telegraphone appears to combine both the sensitiveness and accuracy which is necessary for the purpose, and to The American Telephone Journal it seems one of the coming improvements which the operating companies would do well to study as promising a means of furthering the usefulness of the telephone as a wide reaching and extensive system.

A COUPLE of years ago an invention termed the "Telegraphone" was announced, whereby it was possible to record and audibly reproduce telephone messages. Though seemingly of much promise, few practical applications resulted; but now the discussion of this interesting apparatus is being revived. This, we think, is due to the fact that the inventor has been engaged in continuously improving his apparatus, and having put it in a definite form, a concern under the firm of "Aktieselskabet Telegrafonen" has been started in Copenhagen, so that the apparatus is soon likely to enter an industrial stage.

Fig. 1. Parts of Plate Apparatus.



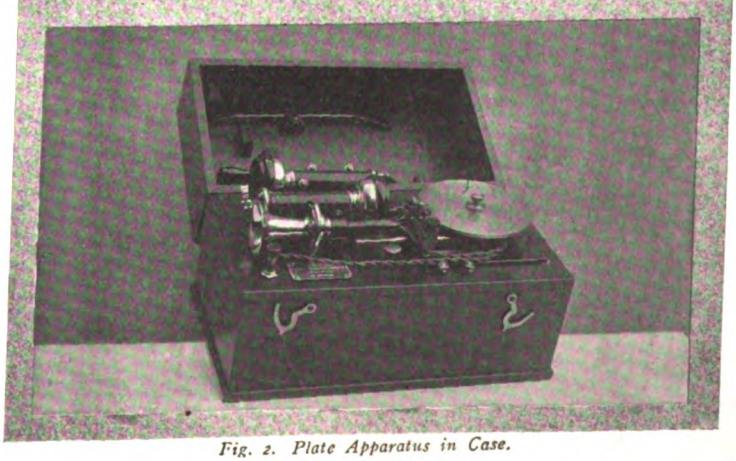


Fig. 2. Plate Apparatus in Case.

The problem or recording and reproducing the human voice has been solved in different ways. Beside the well-known types of phonographs and gramophones, where the record is made mechanically by the movement of an oscillating point, there are some optical and electromagnetical devices, presenting in the first place the advantage of being free from any disturbing secondary noises, so as to reproduce the human voice without any alteration. The former type of apparatus, embodied by Ruhmer's *photographophone*, uses the photoelectric properties of selenium cells, which, though apparently of great promise, are still in an experimental stage. The *electromagnetic phonograph*, as invented by a Danish engineer, Mr. V. Poulsen, to whom I am indebted for information and illustrations contained in this article, is based on the following principle:

On a cylinder there is wound a steel wire or steel band, running in front of the poles of an electromagnet, to the poles of which a microphone is connected. On speaking into the microphone, induced currents produce continuous variations in the field strength of the electromagnet and coils causing changes in the magnetism produced by the latter in the steel wire. This magnetism is permanent and serves to register language. Reproductions are made as follows: The steel wire bearing the electromagnetic record is drawn along before the poles of a similar electromagnet inserted into the circuit of a telephone, so that the process will be repeated in inverted order, acoustic vibrations analogous to the original vibrations being produced in the telephone membrane.

A special advantage of the telegraphone in all its different forms is the ease with which the record may be erased. It is only necessary to saturate the steel wire with magnetism by drawing it in front of a more powerful magnet, so as to compensate any magnetic "level differences," the wire becoming as susceptible of further records as it was before.

The efficiency of the reproduction is specially important; the reproduced language currents are, as a rule, much weaker than those operative in recording. Both in recording and in reproducing, there are losses of energy, due in the former case to the demagnetization of the wire, in the reproduction to the imperfect utilization of the lines of force. The demagnetization of the wire should therefore be prevented as far as possible; both *the speed* and *material* of the wire play a very important role in this connection. The higher the speed with which the record material is drawn along before the electromagnet, the greater will be the length of the sound wave registered and the smaller the demagnetization. In the case of the electromagnet being a one-pole magnet, the efficiency increases with the speed. The conditions are somewhat different if a two-pole magnet is used, so as to form

Digitized by Google

the record by a magnetization transverse to the direction of motion. If the speed used has once attained such values that the length of the wave exceeds the length of the elementary magnets of the record material, the transversal demagnetization will become pre-eminent so as to make any further increase in the speed useless. With ordinary telegraphone apparatus, low speeds are necessary for practical reasons, so the record material should be magnetically as *hard* as possible.

In the reproduction much is lost by the imperfect utilization of the lines of force of the record. In order to obtain effects as satisfactory as possible, the pole of the iron core is wholly covered by the windings, as shown in Fig. 4, the iron cores usually consisting of a piece of soft annealed iron wire, about one mm. in diameter and eleven mm. in length.

As the record consists in variations of the magnetization of the steel, it is invisible, the mechanical stress produced by magnetization in the record material being so small as to be wholly negligible.

With telegraphonic reproduction of the human voice, a characteristic difference as compared with ordinary phonograph reproduction is at once noted; the reproduced sounds are wholly free from any disturbing scratching and other secondary noises, being soft and continuous, like those of the best telephone apparatus.

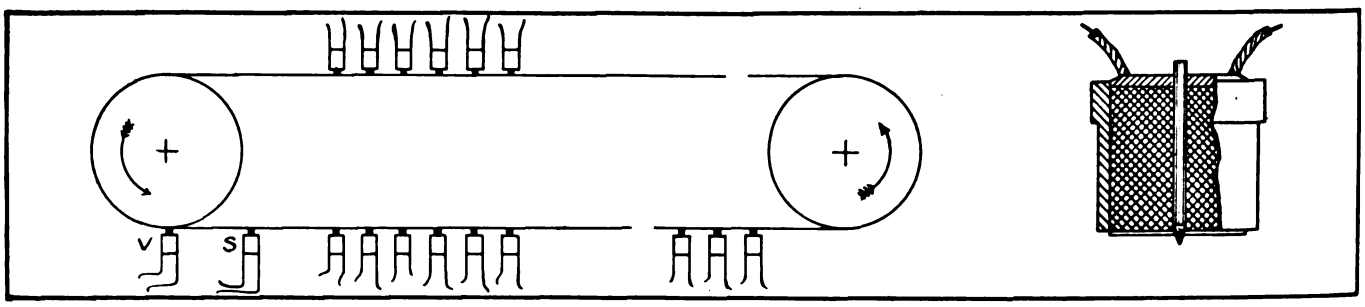
The records may be reproduced more than 10,000 times, without any diminution in the intensity or deformation being noted; the magnetism being really permanent, the record, so to say, is ever-lasting. Still, the record may, as above explained, be easily and rapidly erased by a comparatively strong magnetization of the whole record material. Moreover, the record once made may, if its intensity is sufficient, be transmitted to another record material so as to give a somewhat weaker copy. It has recently been suggested to use the telegraphone to enforce telephone currents by adding synchronous currents from a sufficient number of copies. Though satisfactory results have not so far been attained, Poulsen hopes to arrive at a solution of the problem by the use of better material and higher speeds.

If different speeches are subsequently recorded on the same record material without any previous obliteration, all may afterwards be heard at the same time; as pointed out by the inventor's assistant, Mr. P. O. Petersen, it is possible to record simultaneously two different speeches on the same material and yet hear them apart. In fact, after recording one speech with a two-pole magnet, the two coils of which are, for example, connected so as to have recording poles of opposite signs, the speech will not be heard on connecting the coils so as to give poles of the same sign; the other speech may, however, now be recorded and on afterwards using poles of unequal signs, the former speech will be heard and the latter be imperceptible. The two speeches will thus be reproduced only in the case of the mutual connections of the wire coils being the same as when the record was made.

A special application of the telegraphone is the so-called *telephone newspaper,* being an apparatus by means of which the same speech, the same piece of music, etc., may be distributed to any desired number of auditors. An endless steel band (see Fig. 3) is laid round two rotating discs, which draw the band before an electromagnet that records the news; the latter are afterwards carried before a large number of so-called *"reading-magnets"* arranged in a long series, one behind the other, each being in connection with a different telephone line. The record band eventually passes in front of an obliterating magnet, *V,* whence it again passes before the recording magnet, and so on.

In the first type of telegraphone above described, the record material consists of a steel wire wound in the form of a helix on a cylinder. This apparatus gives excellent reproductions; it, however, has a low capacity in proportion with this volume. In the so-called *coil apparatus* there is used a steel wire of a very small diameter (about 0.25 mm.), running from one coil to another, and passing on its way three or more pairs of magnets or two-pole magnets. The central pair of magnets is used for records and reproductions, whereas the external pairs are *obliterating magnets,* out of which, however, only one pair is operated at the same time. The apparatus is arranged so as to effect obliteration simultaneously with making a record, as the wire passes in front of the operative obliteration magnet before it reaches the recording magnet. The apparatus may be used in both directions, possessing a speed as high as three meters per second and a capacity of about forty-five minutes. There is an index showing the portion of the wire used at each moment. In the *band apparatus,* steel ribbons wound from one disc to another in many layers are used. These ribbons are only about 0.05 mm. in thickness and three mm. in breadth. As in coil instruments, this type of apparatus affords a very considerable speaking capacity in proportion to the volume.

About one year ago Mr. Poulsen began using a new form and arrangement of the record material analogous to those used in connection with mechanical phonographs. A polished reflecting cylinder of magnetically hard material and of similar dimensions as the well-known wax rollers is used, the speed being about 0.5 meters per second, and the pitch of the screw formed by the record about 0.3 mm. On account of these small dimensions the pole of the electromagnet must be of necessity nearly pointed. Similar cylinder instruments will give beautiful reproductions, provided the cylinder be made from suitable material. Mr. Poulsen uses in this connection preferentially Böhler steel. Electrolytic iron, with certain additions, seems as well to be suitable record material.



Figs. 3 and 4. Disc Apparatus.

Now, in the latest form of apparatus, these steel cylinders are replaced by thin steel plates, being less expensive and more convenient. A similar plate apparatus (see Figs. 1 and 2) was recently presented by the inventor to the Northern Technical and Hygienical Congress in Copenhagen. The steel plate, being susceptible of receiving records on both sides, may readily be exchanged, its dimensions (thirteen cm. in diameter, 0.5 mm. in thickness) allowing of its being put into an envelope and sent by post anywhere, in order to be reproduced on a similar apparatus. The electromagnet is arranged so that the iron core, being a piece of pointed iron wire, may easily be changed with another, in the case of a pole being worn out.

The telegraphone seems to be specially valuable in connection with the telephone in large offices, where the conversations that take place may be recorded; in small offices it may be used at the same time to give and to receive notice in the absence of the subscriber. In America such notices have been recorded on a coil apparatus located in the house of a New York subscriber, the sender being in Washington. The reproduction was extremely distinct, in spite of the great distance over which the record was made. As the telephone companies of different countries often use different arrangements, the same type of telegraphone may not be universally suitable, certain modifications in the arrange-

Digitized by Google

ment of the circuit, as well as in the switching mechanism, being necessary. Poulsen therefore hopes to develop some other application of the telegraphone before those connected with telephony.

In the first place, there should be mentioned the easy and rapid means of recording correspondence alluded to, which is afforded by the latest type. Plate apparatus, with greater plates capable of of stronger acoustic effects, are likely to become useful in connection with instruction in language, singing and rhetoric.

In addition to the phonetic application of the telegraphone already described, this ingenious instrument seems to be fit for recording and reproducing any signals consisting in variations of a magnetic field. In this connection the telegraphone has been used to record wireless telegraphy dispatches, though the results so far obtained are not very satisfactory.

DISTRICT MEETINGS OF OHIO INDEPENDENT TELEPHONE ASSOCIATIONS

THE first district of the Ohio Independent Telephone Association held its meeting for the purpose of organizing and electing an executive committee at the Hotel Euclid, at Cleveland, O., on August 16th.

The meeting was attended by sixty-five managers of Independent companies in the district which comprises the counties of Ashtabula, Cuyahoga, Lorain, Erie, Huron, Medina, Lake, Geauga, and Trumbull. Verbal reports were made by all the managers present. In addition to the representatives of the district there were present President Beam, of the State Association; W. F. Laubach, of Akron; J. B. Rhodes, of Zanesville; G. H. Methien, of Lima; R. E. Hamlin, of Toledo; D. E. Sapp, of Mt. Vernon, and Ralph Reamon, treasurer of the State Association.

Mr. Jas. B. Hoge, chairman of the district, outlined the plan of organization for the State—each company to be entitled to one delegate to the district association for each 100 telephones or 100 miles of toll line in their system, the districts to hold semi-annual or quarterly meetings for the purpose of considering matters of importance to the district; the districts to elect annually one delegate to the State convention for each 1,000 telephones or 1,000 miles of toll lines, the State Association to consider subjects of importance to the Independent telephone companies of the State. The president of the district organization to be one of the vice-presidents of the State Association; in case this plan should meet with the approval of a sufficient number of the Independent telephone interests of the United States and should be adopted by a national association, each State could then be organized along the same lines, and each State at their annual meeting elect delegates to the national association, this meeting to be based on one delegate for each 10,000 telephones or 10,000 miles of toll line. The national association would then consider points of special importance to the Independent telephone interests of the United States and take action upon such business as might be submitted to them by the various State organizations.

Mr. Hoge gave as the four principal points to be considered by the district the following:

1. Importance of all companies adopting certain standards of equipment and operation.
2. Division of territory.
3. Guarding against a second Independent company entering the field.
4. Organizing to prevent any Independent companies becoming licensees of the Bell.

Mr. Frank L. Beam, President of the State Association, urged the importance of thorough organization along the lines suggested. Each of the companies represented was given an opportunity to make a report, and all expressed themselves as being in sympathy with the movement and promised to give the organization their hearty support. From figures given it developed that in many counties of the State there is scarcely any Bell competition, that company having no exchanges and only a few toll stations in some counties, in others the Independents have many times the number of telephones operated by their competitor. Mr. Beam spoke of the counties of Knox, Licking, Delaware and Morrow, which corner at a point near Centerburg, O., and which he and his associates have developed quite extensively. The total number of telephones operated by the Independents is 7,922 as compared with 1,685 by the Bell. In Morrow county alone the Independents having 1,500 telephones while the Bell have no exchanges and only three toll stations.

After a short talk by Mr. Clapp, engineer for the conference committee, a large map showing the long distance lines of the six companies comprising the conference committee with their connections from Pittsburg to Topeka, Kansas, was displayed. A number of designs of the shield adopted by the Ohio Independent Telephone Association and the Conference Committee of Independent Long Distance Telephone Companies as the emblem of Independent telephony for use on pay station signs, stationery, etc., were exhibited.

Mr. C. L. Norton was elected secretary for the district and the following executive committee appointed:

S. R. Newberry, from Ashtabula county; W. B. Woodbury, Cuyahoga county; E. L. Coen, Erie county; Dr. Pomeroy, Geauga county; D. Calhoun, Huron county; C. M. Grauel, Lake county; A. V. Hageman, Lorain county; B. Hendrickson, Medina county, and Washington Hyde, Trumbull county.

The second meeting of the Ohio Independent Telephone Association was held at Toledo, O., at the Boody House, on August 17.

The counties represented were Williams, Fulton, Lucas, Ottawa, Sandusky, Seneca, Wood, Henry and Defiance. These counties compose District No. 8.

After Mr. R. E. Hamblin, vice-president of this district, and acting chairman of this district, had called the meeting to order, a motion was made that Mr. H. B. Taylor, auditor of the Toledo Home Telephone Company, be made temporary secretary of the meeting; later, by a motion that was made and carried he was unanimously elected permanent secretary.

Addresses were then made by Mr. Frank L. Beam, President of the Ohio Independent Telephone Association; Mr. J. B. Hoge, vice-president of District No. 1; Mr. M. B. Overly, general manager of the United States Telephone Company; Mr. D. E. Sapp, vice-president of District No. 9; Mr. Morrison, connected with the Toledo Home Telephone Company, and Mr. Cyrus Hulling, of Columbus, O.

The thorough knowledge of the Independent situation that was brought forth in the addresses were of such character that the most beneficial results will be the outcome. Following these addresses, the secretary called the roll of the individual representatives of the counties mentioned. The information obtained of the conditions prevalent in this district was carefully noted, and the immense amount of enthusiasm displayed for a co-operative spirit made the meeting very spirited, and a great success.

The executive committee that is to represent each county was not selected Wednesday, inasmuch as the conditions of this district are of such importance that the chairman thought it advisable to weigh the matter and select, after due deliberation, representatives whose work would be most beneficial to the county that they would represent.

Mr. Stinson, operative manager of the Toledo Home Telephone Company, gave a very interesting talk on the many benefits that they have voluntarily offered to their patrons at Toledo. Judge Donnelly, of Henry county, and Mr. O. L. Spangler, of Williams county, besides other representatives, made addresses, in which they set forth the conditions that were associated in the territory that they represented.

EIGHT MONTHS' OF THE AUTOMATIC AT DAYTON

By H. P. Miller, *General Manager of the Home Telephone Company.*

H. P. Miller,
General Manager.

THE Home Telephone Company, of Dayton, Ohio, was organized in 1901. The officers are J. T. Barlow, president; J. C. Reber, secretary and treasurer, and H. P. Miller, general manager. The plant was built during 1902 and 1903, the work being completed and the installation of instruments begun in July, 1903. No charge was made for services until October 1st of that year; at that time there were 1,800 telephones connected; the growth since then has been steady, until now there are over 3,500 stations connected.

Dayton has a population of about 100,000 people, and is one of the most important cities in the State; therefore, the exchange has been constructed with a view of taking care of future growth, as the following description will show.

The company owns its own building, which is of pressed brick, five stories high, modern in all its equipments and built for the purpose for which it is used. The automatic switches are located on the top floor and are amply provided with light afforded through skylights and from three sides. The automatic installation consists of 6,000 switches, so arranged that an ultimate of 19,000 can be connected. The toll board is located on the fourth floor and consists of seven positions, one of them being equipped for rural lines. On the fourth floor are located the general offices of the company, contract office, wire chief's equipment and the protector mount. Underground cables are brought into the building in the usual way through a shaft. There is an underground cable capacity entering the office for 6,600 circuits with vacant ducts sufficient to bring in as many more.

The underground plant consists of twelve miles of trench and eighty-two miles of conduit. The aerial construction within the city is entirely cable, no cross-arms or open wire being used except in very thinly settled suburbs. Ten, twenty-five and fifty-pair terminal heads are used and each cable pair in the exchange is multipled on an average of three times. The Hall can-top for distributing purposes is used, made by the Mountain State Electric Company, of Wheeling, W. Va. Three-braid twisted duplex is used exclusively for drop wire and insulated weather-proof wire is used for return ground, so that the chances for outside trouble are reduced to a minimum.

The past winter was a very severe one for telephone plants in this section of the country, so that the efficiency of this class of construction has been well tested. The small amount of trouble which has shown up proves that it is an economy to use this method of construction. The outside troubles have averaged about thirty cases per day for the past eight months; this includes instrument, line and cable plant. Switchboard troubles average about ten cases per day; in all a total of forty cases per day, or an average of a fraction over one per cent. The troubles with the automatic switches at this rate do not average as much as the item of cord trouble alone would be with a manual board.

The cost of operating, maintenance, fixed charges, including taxes; general expense, including salaries of solicitors securing new business, for the past eight months has been at the rate of $44,413 per annum; dividing this by an average of 3,000 stations, which would be fair on an eight months' basis, the cost per station is a fraction less than $15 per annum. The total revenue per station is now $30.50 per annum. The rates charged are $40 per annum for business, no discount, and $28 per annum for residence, with a discount of $1 per quarter if paid before the fifth of the month.

A manual exchange of 3,500 stations, at the salaries paid in this section, could not be operated for less than $65,000 per year. The increased cost of operating and maintenance of this exchange, when it reaches 5,000 or more stations, will be very small, as it will not be necessary to add any additional men in the switchboard room and no more to the clerical force; the only increase would probably be an addition of two inspectors on the outside. The maintenance force now consists of five switchboard men, who look after the switches day and night; five inspectors on the outside, a wire chief, assistant wire chief, trouble clerk, cable record work and information operator. A city foreman and his force of linemen are used almost entirely for the installation of new subscribers.

The method of handling the toll business is very simple. The subscriber wishing a toll connection calls 6131, just as though he were calling another subscriber. The switch connected with his instrument selects or picks up the first trunk to the toll board which is not busy, lighting the lamp signal before the recording operator, who answers him with a cord and plug in the usual manner. There are twenty trunk lines from the switches to toll board, so that there is no chance for a subscriber not coming in to the recording operator promptly. By this method the "B," or switching operator, which is always necessary with the manual equipment, is done away with. When a long distance call comes for a subscriber, the line operator inserts her plug into a jack, which is connected with one of a series of trunks going to the switches, operates her dial for the number she wishes to call—each operator's position on the toll board being equipped with a calling dial—and picks up the subscriber direct, just as though another subscriber had called him.

Home Company's Exchange Building.

Digitized by Google

The rural or farmer line service is handled in a similar way. The subscriber on a country line calls in by magneto, signals the rural operator, who answers and calls the automatic subscriber with the dial located on her switchboard position. The city subscriber calls as he does for a toll connection and the rural operator makes the connection and rings the country station in the usual manner.

The service is giving universal satisfaction to the public, as the steady growth of the plant would indicate; in fact, the subscribers are enthusiastic. A few months since, the Automatic Electric Company, of Chicago, sent out about 200 letters to the subscribers in Dayton at random, asking them to give an expression of opinion as to the service; over 200 replies were received, and they are all of such a nature that they could be used as testimonials. Next to Grand Rapids, Mich., Dayton has the largest automatic telephone installation in the world.

THE FRANCHISE QUESTION AT EVANSVILLE

A RECENT statement that the mayor of Evansville, Ind., had instructed the Board of Public Works to pass a franchise submitted by the Cumberland Telephone Company has again brought to the front a situation in the Independent field which illustrates to what ends the Bell Company will go to secure the desired results. A résumé of the situation may be of interest to those of our readers who are not acquainted with the facts.

In the year 1902 the franchise under which the Cumberland Telephone Company had been operating expired and since that time the company has continued to maintain its system.

A suit was brought by the Cumberland Company against the city soon after the expiration of its franchise in 1902 to restrain it from cutting down its poles or otherwise interfering with its operation. A temporary injunction was secured by the company and the case was taken before the Federal Circuit Court to have the injunction made permanent.

In 1903 there was formed in Evansville a so-called municipal telephone company, capitalized at $100,000. Extensive plans for the installation of a city system were prepared, and a franchise was readily granted this new company. About $10,000 was spent in giving the company a start when a Democratic attorney brought suit against the "municipal" company as illegally existing, secured a verdict from the State Court of Appeals dissolving the company and revoking the franchise.

Four months ago an Independent company, called the Citizens' Telephone Company, applied for a franchise. The administration indorsed the new company because it promised to pay off the debts of the defunct "municipal" company, but the terms of this franchise were objectionable and it was withdrawn.

There was then presented to the Board of Public Works a petition for a franchise by the Home Telephone Company. This company offered the city $3,500 a year for a twenty-five-year franchise, and submitted a very fair proposition in regard to the rates to be charged. The rate question is probably one of the most important of any, in respect to public opinion; it being generally understood that no franchise could be granted that did not specify that subscribers on a four-party line should not be charged more than $1 per month.

Everything began to look favorably for the Home Telephone Company's franchise being brought up for discussion before the board at an early date, when an intimation was made to the Mayor, the Board of Public Works and the city councilmen, that the Cumberland Company was about to make a proposition that would be of interest, and for them not to take up the Independent company's petition. The inside information was that delay was valuable, as it would let public sentiment die out in the demand for the $1 telephone, and as a private inducement, so it is said, the Cumberland Company would make good all losses incurred by the city officials in the "municipal" venture.

The tip was effective. The Home Telephone Company's franchise has never been recognized as received, its defects have never been pointed out to the stockholders, and they have never been called before the board to ask if they would make a change inserting a clause covering the $1 telephone. What the objection of a seemingly favorable board was to the passage of the franchise has never been found out. The public were at a loss to understand the move, and they demanded action as they did not want to be left without a telephone service this winter.

On July 30 came the announcement that the Cumberland Company would, on the following Monday, present a petition for a franchise. The move was entirely unheralded and unlooked for by the public, but it cleared up the mysterious disregard of the Home Telephone Company's franchise by the administration.

When it became known that the franchise had been presented to the Board of Public Works and a copy placed on file in their office, the newspapers telephoned and asked for a duplicate. They were told that but one copy had been field, and were offered the privilege of copying it. C. N. Katterjohn, of the Cumberland Company was then communicated with and asked for a copy. He replied that the franchise had not been presented to the board. When the reporters again went to the Board of Public Works they were met with the statement that the franchise had been withdrawn.

On the thirty-first the Evansville *Courier* made a prompt exposure of this underhand move which further strengthened the antagonism of public sentiment against the Cumberland.

The exposure had good results. The franchise was not presented the next day. Instead, inquiry at the Cumberland office met with the response that it was all a mistake, and that the scare the *Courier* had started was a bugaboo.

Three days had passed when the announcement was made from the Mayor's office that the Cumberland Company would present a franchise at the Saturday's meeting of the board and that it would be passed. The Mayor then left for St. Louis.

This information caused a secret meeting of the business men of Evansville to be called, at which a committee was appointed to call on every member of the Board of Public Works and find out his intention as to the franchise. Four were found absolutely non-committal. A fifth stated that "he was no slave to the administration and that he would resign his position before he would be accused of openly selling out to the Cumberland Company by espousing their franchise, should it be presented." The apparently hostile attitude of the majority of the members of the board caused a vigilance committee to be formed, the object of which was to oppose any move the members of the board might make to act favorably on the Cumberland franchise.

From an editorial published in the Evansville *Courier* of August 6th, we quote the following, which thoroughly expresses the feeling of the public:

> We regard a monopoly of the telephone service of Evansville as worth from $5,000 to $10,000 a year for a period of no more than twenty-five years, and a competitive franchise as worth $3,500 a year.
>
> We are opposed to granting a franchise for a longer period than twenty-five years, and to any franchise that does not restrict the maximum rates, insuring the poor man a telephone service at a rate within his means.
>
> To grant a franchise at the present time would be to fail to realize its full value.
>
> To grant a franchise for a period of forty-five years would be a crime against the future and greater Evansville.
>
> To grant a franchise placing no limitations on the rates would be a crime against the people in whose interest the franchise must be made.
>
> To grant a monopoly for $2,250 a year would be a crime against the financial interest of the city, selling a thing of value for a half, a third or a fourth of its worth.

In another editorial the *Courier* says:

> We desire to point out to the people of Evansville that the interests of the city and of the people are being betrayed by the servants they have elected as trustees and guardians of their interests in the deal that has been made, all the terms of which have not been made public and never will be.

On Saturday, August 7th, the date set for the passage of the Cumberland franchise, the Mayor appeared unexpectedly whilst the Board of Public Works was in session and just at the time when the Cumberland's attorney laid the franchise on the clerk's table. The absence of one of the members of the board and the presence of the vigilance committee probably caused the Mayor

Digitized by Google

to reconsider his position, for, after a hurried talk with each of the members, in which he was told of the storm his announcement that the franchise should be passed had made, he instructed the president of the board to announce that there was no business to be taken up and the board to adjourned, the franchise being pigeon-holed. Another meeting was adjourned, there was no business but the Mayor would not allow any action to be taken in the matter.

In comparison with the Independent franchise, which the board has had before it for three months, the Cumberland petition appears at a great disadvantage, it being evident that its acceptance would be nothing less than robbery.

The Home Telephone Company offers the city in return for an exclusive franchise for twenty-five years $3,500 a year and also sets forth a reasonable schedule of years $3,500 a year and also Cumberland Company asks for an exclusive forty-five-year franchise and agrees to pay $2,225 a year. It makes no statement as to the rates to be charged, but does agree to pay the costs of the suit against the city. Since the general opinion is that its suit will be decided in favor of the city it is apparent that its offer in this regard has no value.

Commenting upon change in attitude of the city administration in favor of the Cumberland Company the Evansville *Courier* asks:

Why does the administration propose to give the telephone company a franchise that leaves the people wholly unprotected against exorbitant charges for nearly half a century?

The mayor's only excuse for favoring it is that the city is deriving no compensation at the present time from the telephone franchise. But he ought to know that the city will have a rightful claim for compensation during all this time the company is operating without a franchise, under the protection of the court.

The people of Evansville are now fully alive to the situation and threaten, if the Cumberland is granted the exclusive franchise, to impeach all the city officials who have anything to do with this scandal.

Compliments of THE SOUTH BEND HOME TELEPHONE COMPANY

IN UNION THERE IS STRENGTH.

PROGRESSIVE Independent telephone companies throughout the country have learnt by experience the truth of the old adage, "In union there is strength." As a result throughout the country associations have been formed for the purpose of strengthening the mutual interests of the various Independent companies that are members. One of the most progressive as well as aggressive of these alliances is the Northern Indiana and Southern Michigan Toll Line Association. The fifteen companies which form its membership have a total of 18,500 subscribers in a territory where the Bell formerly held full sway.

At a recent meeting of the association the above cartoon, which is a clever adaptation of one published by THE AMERICAN TELEPHONE JOURNAL, December 5th, 1902, was gratuitously distributed. Attention is called to the list of companies together with their individual number of subscribers, so that some general idea can be gained of the strength of Independent telephony in that part of the country. In this particular instance the effective toll-line systems of the association have caused the overthrow of the Bell monopoly, and so thorough has been the construction of the network of lines that the power of the modern Gulliver has been completely nullified.

QUERIES

Questions on any subject relating to telephony will be answered on this page.

LINE LEAKAGE—(410).

Why does our toll line 15 miles in length, transmit so poorly in wet weather? L. K.

We would advise an immediate examination of the line to discover the existence of broken insulators, dirty insulators and branches touching the wire. Leakage on lines is a common occurrence, as shown in *a, b, c, d, e, f,* in spite of the fact that each insulator possesses an enormous resistance that can only be measured in millions of ohms. The situation is something like that illustrated, where each pole carries an insulator and an incrustation due to dust, and moisture gradually forms a film over the

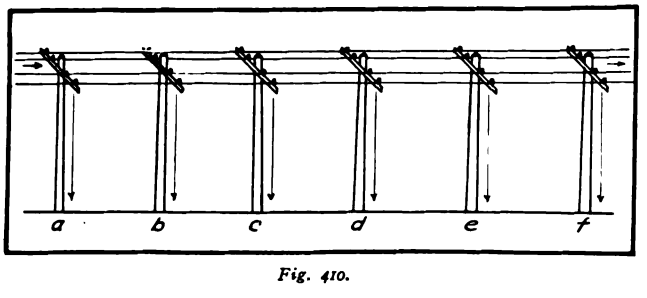

Fig. 410.

surface of the insulator through which a minute current leaks away to the pin and pole and finally to the earth. It would be difficult in any case to remove this fault except by an inspection of the line systematically. If the insulation resistance of one insulator is 5,000,000 ohms on the average, then on an estimate of 40 poles to the mile for 15 miles there would be $80 \times 15 = 1{,}200$ points of contact between insulators and wire. The insulation resistance would be $5{,}000{,}000 \div 1{,}200 = 4{,}250$ ohms total line resistance. For double the length of line the resistance diminishes in proportion until with a very long line and wet weather the insulation resistance may be so low that clear speech is impossible.

CURRENT FOR BRANCH EXCHANGE—(411).

How can we overcome the following difficulty? We supply private branch exchanges with battery from central office potential 24 volts. Some of the leads run as high as 50 ohms resistance, consequently when the exchange has several pairs of cords in use the voltage drops so low that transmission is very poor. E. H. R.

In reply to your query we beg to advise that there are only two ways that we know of to remedy the difficulty of which you speak. One is to locate at the private branch exchange a small storage battery which shall be continuously charged over the leads which you know that by giving this battery sufficient capacity it will be able to supply the demand when several pairs of cords are in use and will be recharged by the current which flows during hours when the switchboard is not in use. The other method is that of providing good conductors of lower resistance. If your present leads are in cable this may be accomplished by using several pairs in multiple arc. If aerial wire is used the same expedient may be resorted to, or heavier wire installed.

CAPACITY OF CABLE POLE FUSES—(412).

What should be the capacity of cable pole fuses for magneto and also for common battery lines? S. L.

The object of the cable pole fuses is to protect the wires in the cable from excessive currents in case the open wire line shall become crossed with an electric light wire or other conductor carrying dangerous quantities of electicity. As the cable conductors are only insulated with paper, it is obvious that when they become unduly heated the insulation will be burned out and the cable ruined, so that it is necessary to provide a fuse, whose carrying capacity is such that it will melt and open the line before the insulation of the cable conductors can be injured. On the other hand, if too small a fuse is used, it may often accidentally break and thus cause trouble to subscribers and expense in replacing it, so that it is necessary on the one hand to provide a small enough fuse to protect the cable and on the other hand a large enough one to avoid frequent accidental ruptures. Experience indicates that from common battery work, a fuse having a carrying capacity of from 5 to 7 amperes is desirable. This provides protection to the cable wire and does not often accidentally break. For magneto exchanges it is customary to use one from 3 to 5 amperes, because as there is no battery upon the line, a more sensitive fuse can be used, without too great a probability of accidental interruptions.

SERIES LINE—(413).

We have a series line carrying about ten telephones. These instruments all work well when used on a line alone, but when connected with a bridged line they seem dead. Can you give us any reason for this and tell us how to remedy it? A. T. Co.

From what you state the trouble is due to the fact that a series line will not give good transmission under any circumstances. This is due to the fact that the ringer coils of the bells at each station not in use act as retardation coils and reduce the transmission qualities of the line. Since this is true of every instrument on a series line, it is quite possible that the trouble is not noticed till the series line is connected to a bridged line, when the party on the bridged line notices the difference at once between the talking qualities of the series instrument and one on his own line. This is due to the fact that in the case of bridged instruments the ringer coils, being bridged across the line and not in series, offer no hindrance to the rapidly vibrating voice currents. We would recommend replacing the series instruments with bridging ones, which will undoubtedly clear the trouble.

CONDUIT ENVELOPE—(414).

What are the standard dimensions for the concrete envelope surrounding a vitrified clay conduit? G. L.

There are no standard dimensions since the position of the conduit with reference to its surroundings, varies. Where there

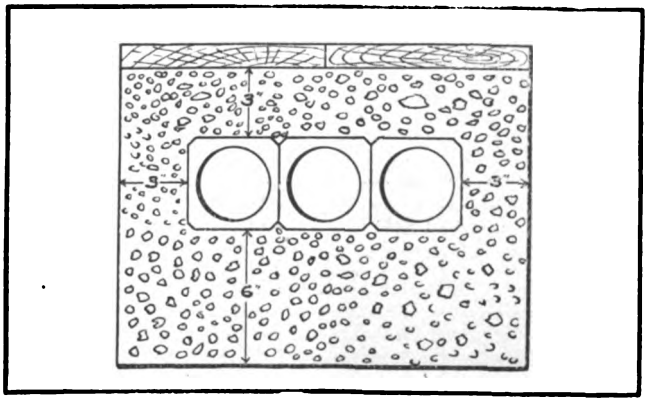

Fig. 414.

are no other underground structures to interfere the general dimensions of the concrete envelope are as illustrated in Fig. 414, and these may be taken as standard.

BATTERY WIRE CORRODED—(415).

A wire connected with our battery is corroded. The battery is compound, partly of wet and partly of dry cells; would this cause the trouble? J. E. S.

It would not. There is some local trouble in connection with the wire. The insulation may have been allowed to become damp and mouldy, or sal ammoniac or some other corrosive agent may have gotten on it. Examine the lead carefully and you will find that the trouble started from some such cause.

THE TWO TELEPHONE BUGABOO.

THE editor believes that he can make no better use of the editorial page this week than to reproduce, practically in full, an open letter "To the Public," just issued by the Independent Company that is seeking a franchise in Green Bay, Wis.

For two years the people of Green Bay have demanded telephone competition, and for two years the Bell people have been fighting the proposition in the customary manner—misrepresentation, brow beating, misuse of the newspaper columns, and underground work directed against the investment of capital. It is the same fight at Green Bay that is being waged at Omaha, where a competing company has asked for a franchise; at Milwaukee and other places. The Omaha papers for months have been full of carefully prepared articles purporting to be "special correspondence" from other cities where two telephone systems are in operation. In reality, of course, these articles are paid for by the line at high rates out of the "defense fund" the parent Bell Company is distributing these days with so lavish a hand. It is evident that the Green Bay Independents do not intend that the Bell Company shall mislead the people there, and the open letter is the first in a series of newspaper communications that are designed to set the matter before the people in a straightforward manner.

There is material here that may be used to advantage by other Independents that are compelled to meet this sort of warfare. The "Open Letter" answers the "two telephone" bugaboo in a masterly manner.

The Bell Telephone Company started business, through various licensed companies, such as the Wisconsin Bell Telephone Company, in 1878. After twenty-six years of absolute monopoly we find the Bell Company giving telephone users in Green Bay the same class of service with the same identical kind of instruments as that company originally installed when starting in business twenty-six years ago. The Bell Company, therefore, has done nothing voluntarily to better equipment or improve service for the people of Green Bay. Yet they charge here for such inferior apparatus and class of service materially higher rates than they do for their improved service and improved instruments in other Wisconsin cities where they have been forced by competition to make a change in both equipment and rates. Prior to the efforts of competition to secure a foothold in Green Bay and give its people the resultant benefits of competition, the Bell Company claimed they were "up to date" here, and resisted improvements desired by the city.

Now they are fearful of competition they change their tactics or promise to. They ask, "What do you want," and say "We will be good." Are the people going to be fooled by such eleventh hour repentance. Over 75 per cent. of the cities in the United States, the size of Green Bay, have turned the Bell Company down by granting franchises to Independent telephone companies. These cities are now enjoying the resultant benefits of competition in improved service, lower rates, double and treble the number of people to talk with, the telephone generally within the reach of the masses. With such a record can anyone question that competition is a good thing?

Is the two telephone talk a valid argument?

Were it so, would not the people of Ohio, Indiana, Illinois, the people of all the other States, the people of Wisconsin generally outside of this east shore strip, have found it out seven years ago and would not Independent telephony have been throttled at its birth? Would the Independent movement, a business men's movement, if you please, all over our country, have succeeded as it has, popularized itself as it has, extended as it has, if the two telephone idea and argument was logical? Would an Independent company, composed of reputable business men, of practical experience, of unquestioned personal and financial standing, be hammering at the portals of Green Bay to invest their capital in competition, if such a contention was well founded? It is exploded Bell Company ammunition. It is about all they have. They know better. It appeals to you on first thought without full and impartial consideration. It temporarily deceives the people where competition is not understood, but rebounds as a most disastrous boomerang on the Bell Company after competition gets established and is in operation. Don't, therefore, be deceived. Don't withhold from the Independent telephone movement that credit accorded to them elsewhere. There is nothing for the city or citizens to lose. There is certainly lots to be gained. In your own State—Wisconsin—in the following sixteen cities: Madison, La Crosse, Janesville, Racine, Sheboygan, Superior, Wausau, Merrill, Appleton, Ashland, Baraboo, Beloit, Kenosha, Marshfield, Monroe and Portage, the Independent companies have a total list of 14,700 subscribers as against 6,900 Bell. Besides there are fifty cities and villages of from 1,000 to 5,000 inhabitants that have Independent exchanges only. There are further, over 7,000 Independent farmer subscribers. In the city of Madison the Independent company has over 2,200 subscribers, and also connects with over 1,000 farmers in Dane County, and some 200 toll stations. The Bell Company has about 500 subscribers in Madison. In Racine, the Citizens' Independent Company has over 2,000 subscribers and reaches over 1,000 more in surrounding towns and villages. In Racine 175 citizens are stockholders in the Citizens' Company, and practically the whole citizenship of the city is enthusiastic in praise of and loyal to the Independent company. In the State at large there are some 200 Independent companies, operating 350 exchanges with 35,000 subscribers and over 1,000 toll stations at the present time, and rapidly extending. Does this situation in Wisconsin look as though competition was a harmful thing and the two telephone bugaboo a valid representation? What is true in this State is also true, and more so, in most of the other States, with the Independent movement going steadily forward. The Bell Company poohpoohed and belittled the movement at the start. They can't keep up with it now and will never catch it. The people have thrown off the yoke of Bell oppression and mistreatment. As before stated, over 75 per cent. of the cities in the United States of 20,000, the size of Green Bay, now have Independent telephone companies operating successfully. The cities of Boston, New York, Washington, New Orleans, Milwaukee and San Francisco are the only cities having more than 200,000 population in which telephone competition has not yet been established. Cincinnati recently capitulated, and an Independent company is now building in Chicago. The Independent Consolidated Telephone Company, of Wisconsin, is building its long distance lines to the city limits of Milwaukee, and, backed by the people, will demand entrance to that city, which will soon be granted, despite the efforts of the Bell Company to keep competition out. What is the situaution in Kansas City, the home of the president of the Wisconsin Bell Telephone Company? In Kansas City conditions before competition were similar, and even worse, than in Green Bay, and relief asked for by its citizens was persistently denied. Competition there has changed conditions entirely. The New Home Independent Telephone Company has built three magnificent exchange buildings, is sweeping the city on public patronage, and already connects with more cities and towns over toll lines in western Missouri and eastern Kansas than does the Bell Company. The number of Independent telephones in operation in the towns referred to is 40,231, as against 9,605 Bell telephones.

In the State of Kansas, in which the Missouri and Kansas Bell Company operates, the number of Independent telephones now in service exceeds 50,000, while the Bell Company has less than 9,000.

ITS HOLLOWNESS EXPLAINED.

Appended to this address to the public are a number of letters from cities that enjoy telephone competition. They round out the case for the Independents. We reproduce two of these letters herewith, one from the Mayor and the other from the leading banker of Madison, Wis.:

"MADISON, Wis., Aug. 8, 1904.

"The effect of competition between the Bell and the local company has been very beneficial to our citizens by reducing rates and increasing the number of subscribers, because of reduced rates, and the local Independent company has so large a number of subscribers that the public, as a whole, do not find it necessary to take both telephones.

"L. S. HANKS,
"President the State Bank."

"MADISON, Wis., Aug. 2, 1904.

"The Bell Company don't cut very much of a figure in the local service. In fact, I do not think the Bell telephone is used in very many private residences. It is true the Bell is used in some of the larger stores, and they have recently made quite an effort to increase their patronage, but so far as I can learn they have not been very successful in this. The Dane County Independent system seems to give universal satisfaction, and I do think competition has increased the number of subscribers.

"W. D. CURTIS,
"Mayor."

In the face of testimany such as this, the Bell Company ought to find it difficult to shut out competition.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

NEED NOT CUT WIRES.

THE city ordinance requiring the Duluth Telephone Company to cut its wires to provide passageway for the removal of a building has been declared unconstitutional in a decision on law points rendered by Judge Windom at Duluth, Minn., and Manager C. M. Mauseau, who had been arrested for failure to comply with the provisions of the ordinance was discharged.

Mr. Mauseau was twice ordered by the city council to open the company's wires on East Third street. Notice was served on the company to that effect, but Mr. Mauseau refused to comply and was arrested.

Declining to enter a plea, Mr. Mauseau filed a demurrer, charging that both ordinances under which the action was brought and the council resolution ordering it enforced were unconstitutional. In the demurrer the defendant maintained that the ordinance was invalid because the title did not suggest its provisions, and that the title and body of the law did not agree. Judge Windom sustained the demurrer.

INSPECTION OF TELEPHONE POLES.

IN an action by a lineman against a telephone company, by which he was employed, to recover for an injury received by the breaking and falling of a decayed pole of chestnut wood, on which he was to place a cross-arm, it appeared that he had worked at such employment for less than a year, and only in defendant's service, and that the line on which he was working was an old one, the poles having been set for eleven years. There was evidence tending to show that plaintiff had not been warned of the danger or instructed to inspect the poles before climbing them, and that he was preceeded by the foreman and another whose duty it was, under the rules of the company, to make the inspection, but that they did not do so. The court held that a positive duty rested on the defendant company, both to warn the lineman and to require an inspection. The evidence being in conflict as to the performance of such duties, the court decided that both questions were properly submitted to the jury. The foreman was held to be not a fellow-servant of the lineman in regard to the inspection, but a vice-principal, representing the company. The company could not escape the obligation by delegating the duty to the foreman or to any one else, and was, therefore, liable to the plaintiff for his injuries. Cumberland Telep. & Teleg. Co. vs. Bills, 128 Fed., 272.

WAR REVENUE ACT.

THE New York Telephone Company has failed in its attempt to recover from the collector of internal revenue certain amounts that it paid on its telephone business under the War Revenue Act of June 13, 1898. During the period for which the taxes were collected, there were in existence in the city of New York contracts for limited telephone services, made by the plaintiff with its subscribers, by which it agreed to transmit a given number of messages for a stated sum which averaged 15 cents per message; for instance, when the number of messages was limited to 600, the price paid was 10 cents for each message in excess of 600. The tax imposed was one cent for each message for which a charge of 15 cents or more was made. The amount for which the company sued was $21,492.75, and interest.

The company contended that the plaintiff could have so drawn the contract as to avoid the payment of the tax, that the law was intended to cover only messages sent from a public pay station, and argued that the private installation, directory listings, and other advantages, distinguished the messages upon which the taxes were paid from those intended to be covered by the law. The contracts define a local message as follows: "A local message is a personal communication, five minutes or less in duration, from said station to another station connected with an exchange of the company in said borough." The court said that the contract was perfectly plain, that there was no ambiguity nor necessity for interpretation, nor room for construction. If the contracts under discussion had been drawn for the express purpose of bringing them within the terms of the act, language more apt could scarcely have been selected. The court considered that the privileges accorded the subscriber were only the necessary ingredients of an agreement to transmit the 600 messages. About the act the court found nothing ambiguous, and would not consent to take into consideration the legislative intent in order properly to interpret the enactment. "What the law-makers intended to do is immaterial when what they actually did do is free from doubt." New York Tel. Co. vs. Treat, 130 Fed., 340.

NUMEROUS 5-CENT JUDGMENTS.

THE justice courts of Chicago still continue to render judgments against the Chicago Telephone Company for the nickels dropped in the slots of the toll stations in cases where connection with the party called is not secured. Constable John Small recently won his third 5-cent judgment against the Chicago Telephone Company. He told the justice that he dropped a nickel in the slot and the operator disconnected immediately after he began the conversation. Costs were $4.65.

CONDEMNING MINERAL LAND.

THE Supreme Court of Kansas has given an instructive decision in a condemnation case brought to take land for a railroad right of way. An appeal was taken from the award of commissioners in the assessment of damages. The complaint was that the theory of the trial court, in presenting the issue, to-wit, the amount of damage suffered by the owner of the land by reason of the taking as presented to the jury by the instructions, was misconceived, or at least not fully and fairly presented. The bill of particulars alleged that the land sought to be appropriated was used for mining purposes and the evidence clearly and without contradiction showed that practically its entire value consisted in the minerals lying within 100 feet or more beneath the surface. The evidence presented the issue whether these minerals might not, to a large extent, be removed from underneath the right of way without interfering with the right of the company to use it as such right of way. The theory upon which the trial court proceeded was that the permanent taking of the right of way for the railroad practically amounted to a complete and permanent deprivation of all the rights of the plaintiff therein and of the beneficiary use thereof.

Commenting upon this theory the court said that it was ordinarily the correct one, or so closely approaching it that its adoption was not material error, because ordinarily the beneficial use of land is found solely in the surface thereof. The more correct rule is, "the measure of damage caused by the appropriation of a right of way of a railroad is the difference in the value before the appropriation and immediately thereafter." This rule is open to the consideration of the jury, all of the elements remaining with the fee going in mitigation. In the present case the railroad company obtained no right to remove any of the subjacent minerals. They all remained the property of the owner of the fee. The railroad company obtained the right to surface support. The owner of the fee, therefore, might not remove any of the subjacent strata necessary thereto, but, subject to this right of surface support, might remove all of such subjacent matter.

The court's instruction was therefore erroneous, because the jury estimated the damages as though the railroad company was becoming the absolute owner of the right of way and everything beneath it. Mo. K. & N. W. R. Co. vs. Schmuck (Ka.) 76 Pac., 836.

IN THE OPERATING FIELD.

GOVERNMENT TO OWN TELEPHONE PLANT.

AS a result of a Cabinet meeting held recently, Secretary Morton, of the Navy Department, will immediately commence an investigation as to the advisability of the government installing an Independent telephone system connecting all the departments and bureaus of the Federal establishment. It has been suggested that the project, if carried through, may ultimately extend the proposed service to the citizens of the District. The whole question, however, is in abeyance, and no action will be taken upon it until after the Secretary of the Navy makes his report. He will receive recommendations from the various heads of departments and an opinion from the Attorney General as to the laws relating to the subject before he decides upon what course he will advise in the matter. Mr. Morton declined to discuss the subject after the Cabinet meeting, preferring to wait until he would have had an opportunity to look into the situation carefully.

The instructions to Secretary Morton to examine into the question of establishing an Independent system by the government were brought about by a discussion at the Cabinet meeting of the proposed new schedule of rates submitted by the Chesapeake and Potomac Telephone Co. for the coming year. Some of the officials of the departments consider the rates out of proportion to the service.

ORANGE AND SUSSEX INDEPENDENT TELEPHONE MEETING.

THE quarterly meeting of the Orange and Sussex (N. Y.) Independent Telephone Company was held at Washingtonville recently. Those present from the Orange County Telephone Company, of this city, were A. B. Wilbur, M. B. Wolf, W. C. Ramsdell and John McWilliams.

The other companies represented were the Colonial of Newburgh, the Highland of Washingtonville, the Warwick Valley of Warwick, and the Farmers' Union of Sussex.

Most encouraging reports were made concerning telephone matters, showing that the various companies were enjoying a large degree of prosperity.

There were various discussions regarding toll rates and points for increasing the efficiency of the service.

The next meeting will be held at Port Jervis on November 3.

INTERSTATE APPLIES FOR FRANCHISE IN OMAHA.

APPLICATION has been made to the city council of Omaha, Neb., for a twenty-five-year telephone franchise by the representatives of the Interstate Telephone Company, of Dubuque, Iowa. The applicants guarantee a system of at least 2,500 subscribers with a monthly rate of $3 for business and $1.75 for residences on individual lines. Copper metallic circuits will be installed and the city is offered a royalty of three per cent. on the company's gross receipts. The company's lines at present extend across Iowa to the neighborhood of Council Bluffs, and provided the Omaha franchise is obtained application will be made for a franchise in Council Bluffs.

HANAMO TELEGRAPH AND TELEPHONE COMPANY ISSUES A HAND-BOOK.

THE Hanamo Telegraph and Telephone Company, which operates a system of toll lines in Northwestern Missouri, has issued a hand-book describing its system from both financial and telephonic standpoints. This company holds contracts for toll line service with the Home Telephone Company, of Kansas City, which operates exchanges in Kansas City, Mo., and Kansas City, Kan., having a capacity for 10,000 subscribers; Leavenworth, Kan.; Topeka, Kan.; Springfield, Mo.; Joplin, Mo.; Fort Scott, Kan., and Lincoln, Neb., and by means of its contracts with these exchanges it has connection with St. Louis, Mo., where there is an exchange of 20,000-line capacity.

It is also privileged by means of these contracts to extend its lines and make connections with Omaha, Neb.; Sioux City, Iowa; St. Paul and Minneapolis, and all points west, including Chicago.

The purpose of this company, as set forth in the hand-book, is to furnish toll line connections for all Independent companies that may wish them, including the so-called farmers' lines or mutual companies.

The financial part of the book is devoted to the extent of the territory the company can cover from which to draw its income, and also to the high grade of construction which it has so far installed and will continue to do. The company's charter is given in full, together with a copy of the revised statutes of the United States dealing with telegraphs.

WILL MADE BY TELEPHONE.

THE will of Charon Briggs, of St. Louis, Mo., which was made by telephone, was filed in the Probate Court recently.

The instrument was made over telephone for the reason that the testator was confined in the St. Clair contagion hospital with small-pox. Two days prior to Briggs' s death he expressed a desire to make his will. Dr. A. L. Reuss, the county physician, suggested that Briggs telephone his wishes to Mrs. Eliza Hill, the matron of the county farm, and have her take them down in writing and attested by the attendant at the hospital.

THE TELEPHONE ON THE FARM.

AS an illustration of the value that is placed upon the telephone by the farming communities of the Central States, the following incident may be of interest: A farmer who had a telephone connection with the local telephone company of Norwalk, Ohio, wished to purchase another farm a mile or so distant. Before doing so he called upon the manager of the telephone company to find out how soon a telephone could be installed at the farm house he wished to buy. When told not before a year he decided to wait rather than do without the telephone service.

Another farmer in the same locality, wishing to sell his property, made special note in the advertisement that there was "splendid telephone service in the house." Incident to these remarks it might be stated that the service furnished is common battery, with selective ringing.

MUST AMEND ITS COMPLAINT.

THE demurrer of the defendants in the suit of the Rocky Mountain Bell Telephone Company against the Utah Independent Company for an alleged infringement of the copyright law in using the telephone numbers adopted by the plaintiff was sustained by Judge Hall recently on the ground that the complaint did not set forth what loss would result to the plaintiff in case the Utah Independent Company did use its telephone numbers. The court granted the Bell Telephone Company ten days in which to amend its complaint.

A PROGRESSIVE NEW YORK COMPANY.

THE Wayne-Monroe Telephone Company, which was organized in September, 1903, is one of the most progressive companies in New York State. The company began operations with sixty subscribers in the town of Walworth. The line was then extended to Ontario, where it now has sixty-five telephones. Later the system took in the towns of Williamson, with one hundred and six subscribers, and Macedon, with

Digitized by Google

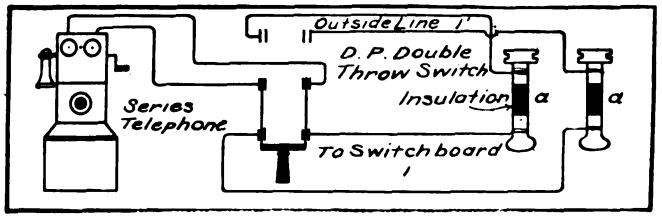
eighty. At present the company is extending the system to Sodus, where is has already secured contracts for one hundred and thirty telephones; Wolcott, Red Creek, Fair Haven, and from Williamson to Palmyra by way of Marion, which will give the system connections with Buffalo, by way of Rochester.

AN EASILY-MADE TEST SET.

By A. L. DeRonde.

IN making tests to determine the nature of trouble and also its location it is necessary that there shall be some means employed to separate the exchange circuits from the line. In general this division of circuits is made at the main distributing frame at the side directly connected to the cable head of the outgoing lines. Usually some sort of a jack is provided which can be inserted between the connecting springs in place of the heat coils, the leads from this test jack being connected with the testing apparatus. Some time ago I was connected with a company that had installed a new heat coil arrester frame. Since no test plug was provided, I devised the following arrangement, the description of which may be of interest to others:

Referring to the Figure, *a a'* are two heat coils, from which the wire and fiber sleeves have been removed, *b b'* are two pieces of twisted electric light cord, one pair being connected to the line side of the coils, the other to the switchboard



side. On a wall is mounted a series telephone and alongside of this is a double-pole double-throw switch. The telephone was connected to the center of the switch as shown in the illustration, and the leads from the heat coils connected to the outside springs, the switchboard terminal of the heat coils to one side and the line terminals to the other. In using this device remove the regular heat coils and insert the test ones in their place; then, by throwing the switch to close the line terminals, the outside circuit can be tested, and by closing the telephone to the switchboard leads the exchange circuits can be tested.

In locating trouble this method is far superior to bridging a telephone across the line because the locality of the trouble can be determined at once and thus a great deal of time can be saved. The description given is to show the application of this method of detail, but it is evident that the construction can be changed to meet different conditions and that the use of a specially designed jack may be employed in the place of the dummy heat coils.

INDEPENDENT IN PREFERENCE TO BELL.

THE stockholders of the Sangamo Valley Telephone Company held a meeting at Williamsville, Ill., recently to determine whether they would connect their system for long distance business with the Central Union Telephone Company.

C. H. Rottger, representing the Bell Company, and F. W. Kelley, representing the Interstate Company, were present, and each addressed the meeting in behalf of their respective companies, and by over a two-thirds vote the Sangamo Valley Company decided to connect with the Interstate Company. The Sangamo Valley Company is operating at this time nearly 100 telephones and is extending its lines and adding more telephones all the time, and will be a valuable addition to the Interstate's large list of toll connections.

SOME MICHIGAN FACTS.

THE value of the Independent telephone system in the State of Michigan is well illustrated in the case of the village of Alma. Before the Union Company started in business Alma had less than twenty-five telephones; the rates charged were $48 for business houses and $36 for residences per year. Since the advent of the Union Telephone Company upward of 300 subscribers have been secured for its system and the rates reduced to less than one-half. The toll line service of the Union company is in almost every respect far superior to the Bell, at the same time the charges are much less, notwithstanding the fact that the Bell Company has reduced its rates to compete with its Independent rival. This large development has also been equalled in every town where the Union Company has established a system, and to-day a subscriber to an Independent exchange can communicate with over 1,000 towns and cities and over 60,000 subscribers in the State of Michigan.

SOUTHEASTERN KANSAS ASSOCIATION MEETING.

THE members of the Southeast Kansas Telephone Association, comprising Chautauqua, Wilson, Montgomery, Neosho, Labette, Crawford and Cherokee counties, in Kansas and Indian Territory, held the second convention of the organization at Joplin, Mo. The adjustment of the toll line service rates and difficulties associated with this department of the business was the chief business transacted.

The officers of the organization are: President, G. H. Spangler, Chetopa; vice-president, E. W. Dow, Baxter Springs; secretary and treasurer, M. L. Robeson; executive committee, W. M. Stetson Cherryvile; A. Dudley.

The meeting was a representative gathering of all the leading men in this section of the States. Those in attendance were: E. W. Dow, Baxter Springs; G. H. Spangler, Chetopa; Fred H. Brown, Parsons; John Rings, Oswego; Harry Farris, Chicago; P. J. Sheppard, Chicago; G. W. Cooper, St. Louis; J. K. Williams, Galena; L. C. Adams, Cedarville; M. Robeson, Galena; James A. Patmor, Kansas City; M. L. Robeson, Galena.

The principal business of adjusting rates on the long distance lines was discussed at length. It seems a double rate has existed and the meeting yesterday was for the purpose of making rates equitable and harmonious throughout this section of the State and Indian Territory. The operators have agreed on most of the points of difference and all matters were settled yesterday.

TELEPHONE SYSTEM FOR TORONTO.

THE city of Toronto will receive sealed offers up to noon on Saturday, October 1st, for the installation and operation of a telephone system in the city upon terms and conditions which may be obtained from the City Clerk, City Hall, Toronto. All bids must be accompanied by a cash deposit or marked check for the sum of $5,000 and made payable to the order of the City Treasurer. This deposit is required to guarantee to the city the fulfilment of the accepted bid of any party, in accordance with the contracts and terms of the specifications. Those desiring to submit bids should address them to the Mayor, Thomas Urquhart, who is chairman of the board of control. To be certain that the bids have been delivered they should be sent registered. It should be understood by all parties participating in this matter that the city does not bind itself to accept any tender.

INDEPENDENT FRANCHISE GRANTED IN ASBURY PARK, N. J.

E. H. SNEDEKER, late general manager of the New York & Long Island Telephone Company, has secured a franchise for an Independent plant at Asbury Park, N. J. Several other applications had been brought before the board of freeholders, but without success, the reason being that two systems were unnnecessary. After a hard fight extending over two months, during which time a petition signed by 239 out of the 250 Bell subscribers for an Independent company was presented to the mayor and city officials as evidence of the necessity of a competing company, the franchise was granted. The conditions imposed are that a system shall be installed and in working order within ninety days, and that a tax shall be paid for the franchise. It is expected that the new system will start with 300 subscribers.

Mr. Snedeker has also applied for franchises to operate competing systems in Long Branch, Ocean Grove and Neptune township.

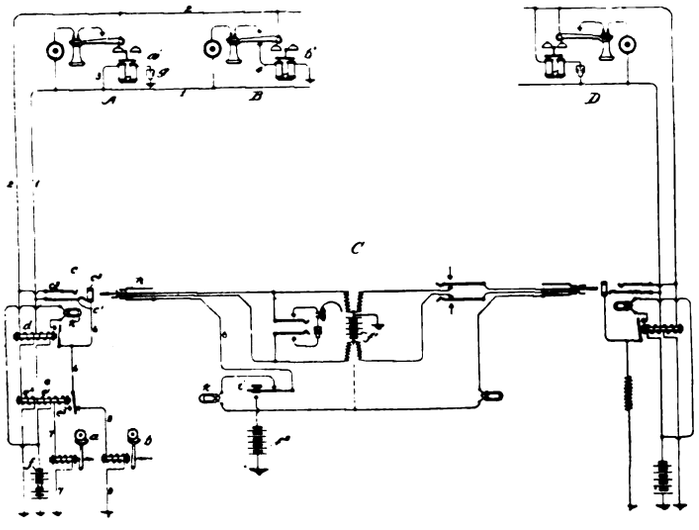
TELEPHONE PATENTS

MEASURED SERVICE SYSTEM FOR PARTY-LINES.

James L. McQuarrie, Chicago, Ill. Patents No. 766,192, and assigns to Western Electric Company, Chicago, Ill. An Improved Switchboard Circuit for Measured Service.

This invention is shown in the accompanying illustration, and is designed particularly to operate in connection with party lines to provide a service meter so arranged that the calls from the different stations upon a party line may be separately registered and thus properly charged.

Each sub-station of the party line is provided with usual telephone apparatus in a bridge being normally open at the contacts



of the usual telephone switch hook. A call bell for receiving signals is provided at each station. Call bell *a'*, at station *A*, is included branch *3* to ground or other return conductor from limb *1* of line, and the bell *b'*, at station *B*, is included in branch *4* to ground from the other limb, *2*, of the line. The branch, *3*, at station *A*, is always open as to direct currents by condenser, *g*; this condenser is adapted to permit passage of alternating or pulsating currents. There is no condenser in ground branch, *4*, at sub-station *B*, but this branch is controlled by the lower contact of telephone switch hook, so that when receiving telephone is taken from its hook the circuit of branch *4* is opened. These call bells are of high impedance to prevent shunting of telephone currents; but resistance of bell *b'* is so proportioned to resistance of windings e^1 and e^2 of relay *e* at the central office that when bridge at station *A* is closed by telephone switch, sufficient current will be shunted from winding e^2 through the branch *4* at sub-station *B* to unbalance the relay *e* and cause same to attract its armature.

When telephone at substation is in use ground branch *4* is opened, and the flow of battery current is substantially equal in both windings *e* and e^3 of relay *e*, so that the magnetic effects of said windings balance one another, and the armature of relay remains unattracted.

Besides line springs c' c^2, spring jack of party line has a third contact or test ring, c^3, adapted to register with third contact or sleeve of a plug which may be inserted in the jack, whereby local circuit *6* of central battery *f'* in the plug circuit may be completed. Circuit *6* has two branches, *7* and *8*, controlled by differential relay *e*. Normally the circuit of branch *8* is closed through the armature-switch lever and normal resting contact of relay *e*; when relay draws up its armature it breaks the circuit of branch *8* and closes branch *7* in its alternate contacts. A responsive device, such as connection counter, may be included in each of the branches, *7* and *8*; a switch provided for local circuit *6*, which terminates in third contact of answering plug *h* for changing electrical condition of circuit to actuate such responsive devices which may have been brought into operative relation to the circuit.

Responsive devices are illustrated diagrammatically as toll counters or connection registers adapted to effect registration upon each current impulse of suitable strength. The device for operating the responsive devices is a switch or push-button, *i*, connected with plug circuit, adapted when depressed to apply to the circuit an impulse of current from battery *f'* stronger than that which is normally applied to circuit from battery *f'*.

The removing of received at either sub-stations *A* and *B* determines which of the connection registers, *a* or *b*, shall be brought into operative relation to circuit *6*, and register thus selected is then operated when key *i* is depressed.

AUXILIARY APPARATUS FOR TELEPHONE SYSTEMS.

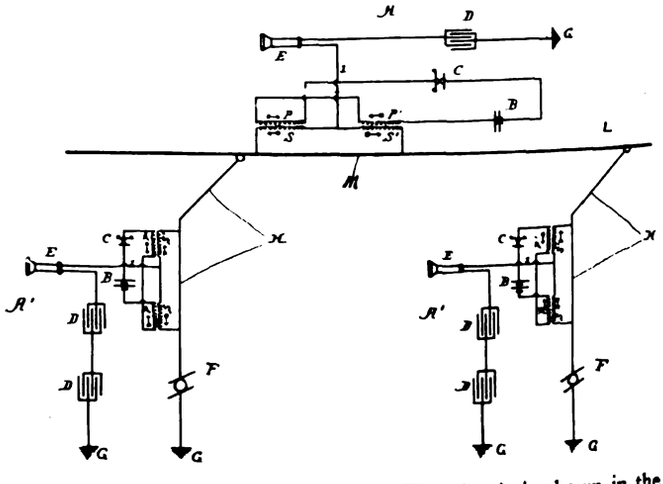
William W. Dean, of Chicago, Ill., assignor to Walter S. McFarlan, of Washington, D. C., patents (No. 765,768). It is well known that the ordinary telephone lines are idle for a very large proportion of each day, and thus a notable fraction of the capital invested in a telephone installation is out of service for a great proportion of the time. Mr. Dean considers that it may be feasible to so arrange a telephone line that it may be used for other purposes than simply that of conversation. So he provides in connection with the distributing frame an auxiliary rack on which an additional set of terminals is placed to which other apparatus can be attached without disturbing or interfering in any way with the function of the telephone lines.

SUBSTATION SWITCH.

William Merriman Kelly and Geary Eldridge Truxell, of Greensburg, Pa., patent (No. 767,284). This patent relates to a novel design for switching contacts at substations. Upon the ordinary hook switch of the substation set, the inventors mount a box. The ringing contacts are placed at one end of this box and the talking contacts at the other end. At the bottom of the box, a small portion of mercury is placed. When the receiver is on the hook switch, and the lever thereby depressed, the mercury flows to the front end of the box and closes contact between the ringing terminals. When the receiver is removed, the hook switch rises, the box is tilted and the mercury flows to the other end opening the ringing circuit and closing the talking circuit.

TELEPHONY

Isidor Kitsee, of Philadelphia, Pa., patents (No. 766,502). The intention of this invention is to provide a means whereby telephone messages can be sent to and from a moving car, either from



a fixed station or from another car. The circuit is shown in the accompanying illustration in which *M* is supposed to be trolley wire of an electric car, *F* a car motor. The inventor provides a

Digitized by Google

special induction coil in which the primaries and secondaries are wound in two parts. As is shown the secondaries *S* and *S'* are connected in series and form a shunt to the conductor from the trolley wire to the motor, while the primaries *P* and *P'* are connected in opposition through the battery *B* and the transmitter *C*. The receiver *E* is bridged from the center of the secondaries through two condensers *D D* to ground. The inventor states that with this arrangement of circuit his experiments show that it is feasible to transmit telephone messages by means of a trolley wire between two cars or between a car and a station without sensible interference from the electric current which is used to propel the car.

TELEPHONE TRANSMITTER.

Auguste Gamache, of East Clifton, Canada, patents (No. 766,821). The object of this invention is to provide an improved and more powerful transmitter. A section of the instrument is shown in Fig. 3 while the circuit is shown in Fig. 5. From Fig. 1 it will be perceived that the transmitter is constructed in the usual manner, excepting so far as the capsule is concerned, which contains the granular carbon. Referring to Fig. 5, it will be seen that the induction coil consists of two primaries *84* and *81*. From battery *82* a wire runs to terminal *1*. Just beyond this point the circuit splits, one conductor going to the point *90*, thence through primary *84* to the terminal *91*, thence to the rear

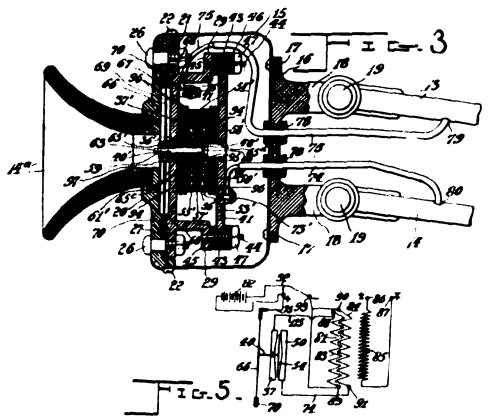


FIG. 5.

electrode *50*; also there is another conductor to the terminal *89*, thence through the other primaries to the terminal *88* and thence to the other electrode *37*. Both of these electrodes are stationary. To the diaphragm *66* a plate *54* is attached. By means of the support of *40*, this plate is placed between the two electrodes *37* and *50*. As the diaphragm vibrates, it alternately compresses and releases the carbon granules which are included between the plate *54* and the two electrodes *37* and *50*. By this means the inventor claims to secure a much more powerful transmitter. The details of construction will be readily understood by referring to Fig. 3, in which similar numerals are employed.

TELEPHONE CENTRAL EXCHANGE INSTALMENT.

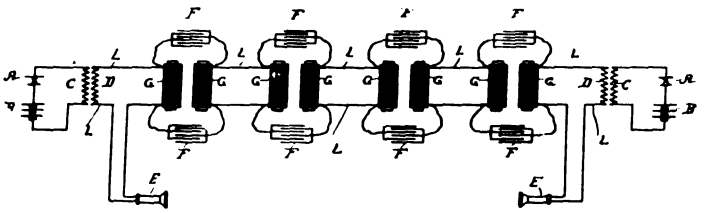
Richard M. Beard, of New York, N. Y., assignor to International District Telephone Co., of New York, N. Y., a corporation of New Jersey, patents (No. 767,033). This invention relates to the maintenance of secrecy upon telephone systems in such a manner as to prevent the operator or other parties from breaking into the circuit when two persons are in conversation. The inventor arranges the jacks in the switchboard in such a manner that the insertion of a plug cuts off all the multiple jacks which are beyond the one in which the plug is introduced. He also arranges the ringing and listening keys in such a manner that the operator is not bridged across the line, but each key is so planned that when it is manipulated, it opens the circuit completely; therefore, if two parties are in conversation and the operator endeavors to listen in she opens the circuit and thus stops conversation.

SELECTIVE TELEPHONE SYSTEM.

Henry Ivins Hawxhurst, of East Oakland, Cal., patents (No. 766,945) a selective telephone system. The object of this invention is to provide a mechanism for signalling individual sub stations without ringing any station but the one desired. The inventor provides an electric magnet whose armature operates a pawl that actuates a toothed wheel. This wheel actuates a second wheel which the inventor terms momentum wheel. As the momentum wheel swings under the impulse from the electro magnet, it is arranged to close a contact that completes the ringing circuit. As it requires a different number of impulses for each station in order to actuate the ratchet wheel and set the momentum wheel swinging, it is possible to individualize the separate stations for ringing.

TELEPHONIC TRANSMISSION.

Isidor Kitsee, of Philadelphia, Pa., patents (No. 766,503). This invention relates to improvements in transmission over long lines and is illustrated in the accompanying illustration in which *A B*



is the local circuit at each end of the line, comprising a transmitter *A*, a battery *B*, and a primary of an induction coil *C*. The line circuit extends between the stations and comprises a receiver *E* at each end of the line in series with the secondary of the induction coil *D*. Further it will be seen that the line is divided into a number of sections *F F F*. Each section is terminated by an electric magnetic coil *G*, which is bridged by a pair of condensers F. By properly proportioning the capacity of the condensers, the inductance of the coils *G* to the length of the sections, the inventor claims improved transmission.

PNEUMATIC TUBE SYSTEM

G. F. Atwood, of Hoboken, N. J., patents (No. 766,213) and assigns to the Western Electric Co., of Chicago, Ill., a pneumatic tube system. The object of this invention is to provide a pneumatic system for the distribution of toll tickets. The general scheme of the invention is illustrated in Figs. 1 and 7. The inventor provides a blower *b*, to which the suction pipe *b* and a blower pipe *b2* are attached. A number of valve boxes *d* are provided, which may be installed either in the main pipe or branches thereof. These valve boxes are so arranged that the

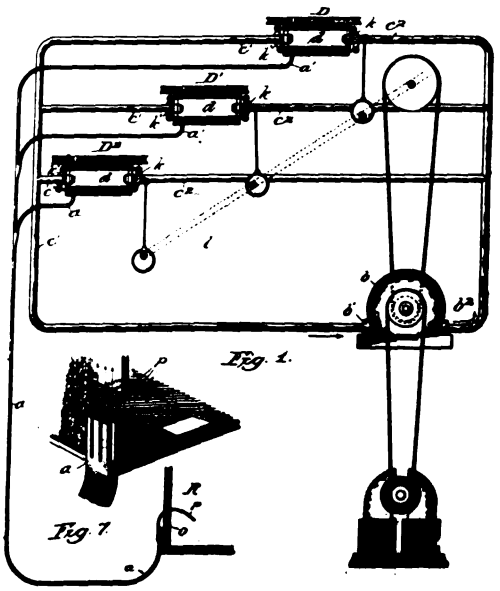


Fig. 1.

Fig. 7.

suction pipe withdraws the air therefrom, while the blower pipe introduces compressed air. Tickets to be transmitted are placed in the box and the valves *k* operated whereby the tickets are blown along through the pipe and delivered upon a receiving desk, as shown in Fig. 7.

THE WEEK'S MESSAGES

FINANCIAL.

ROCKVILLE, IND.—The Parke County Telephone Company has increased its capital stock to $36,000. Extensive improvements and extensions of lines will now be made and some modern equipment installed. The following directors were elected: A. M. Adams, F. H. Stark, Frank M. Boyd, W. B. Thomson, J. B. Connelly, J. L. Swaim and E. O. Barnes.

PALO, MICH.—The Palo Telephone Company has increased its capital stock from $6,000 to $10,000. The new money will be used in extending rural lines.

GUIDE ROCK, NEB.—The Guide Rock Telephone Company has increased its capital stock to $8,000.

ROCHESTER, N. Y.—The Wayne-Monroe Telephone Company has increased its capital stock from $30,000 to $100,000. The line will be extended for many miles.

DAYTON, OHIO.—The stockholders of the Home Telephone Company have authorized an increase of $200,000 in the preferred stock of the company. The capital stock is now $1,200,000.

LEWISBURG, OHIO.—The Lewisburg Telephone Company has increased its capital stock from $10,000 to $20,000. E. J. Ozias is president.

MONMOUTH, ILL.—The last monthly report of the Monmouth Telephone Company showed gross receipts $1,183.45, with an expenditure for the month of $978.67, which included an item of $300 paid out in bonds. The extensions for the month, included in the above expenses, amounted to $106.45.

MT. BLANCHARD, OHIO.—The People's Telephone Company, of Mt. Blanchard has increased its capital stock from $25,000 to $50,000.

ROCKFORD, ILL.—The directors of the Rockford Telephone Company have decided to put out an issue of 5 per cent. bonds to take up the outstanding 6 per cent. debentures. The company has at present 2,000 lines, which will be increased as rapidly as possible to 4,000, involving an expenditure of between $50,000 and $100,000.

ROCKVILLE, ILL.—The Park County Telephone Company, of which A. M. Adams is president, has increased its capital stock to $36,000.

SODUS, N. Y.—The Wayne-Monroe Telephone Company has increased its capital stock from $30,000 to $100,000. The company has been doing a prosperous business and proposes to use the additional money for extensions.

CLEVELAND, OHIO.—The gross earnings of the Cuyahoga Telephone Company for the month of July were $36,608, expenses $21,986; net, $14,632.

CLEVELAND, OHIO.—The monthly statement of the Lancaster Telephone Company show gross earnings of $1,512; expenses, $952; net earnings, $562; deductions, $222; surplus, $340.

CLEVELAND, OHIO.—The United States Telephone Company reports an increase of gross earnings of about 9 per cent. for June over the same month last year. The statement compares as follows: Gross, 1904, $34,471.07; 1903, $31,693.60. Expenses and taxes, 1904, $22,081.07; 1903, $20,793.12. Net earnings, 1904, $12,390.00; 1903, $10,900.48.

YOUNGSTOWN, OHIO.—The monthly statement of the Youngstown Telephone Company shows gross earnings of $4,295; expenses, $2,295; net earnings, $2,000; deduction, $1,208; surplus, $791.

FRANCHISES.

ALTON, ILL.—A representative of the Fosterburg, Bethalto, Brighton and Wood River Telephone Company has applied for a franchise in this city.

WHITEHALL, ILL.—The Illinois Telephone Company has been granted a five year franchise in this town.

BICKNELL, IND.—George Buck and others, of this place, contemplate organizing a new telephone company, and will ask the county commissioners to grant a franchise.

SO. McALESTER, IND. TER.—The Schooler Brothers have been granted a franchise to operate a common battery telephone system in this city, in competition with the old telephone system.

PARKER, KANS.—The Parker Telephone Company has been granted a franchise and will install a local telephone exchange. It is capitalized at $2,000.

HOUGHTON, MICH.—The city council has granted the Automatic Telephone Company permission to construct a local system.

STARBUCK, MINN.—The White Bear Lake Telephone Company has been granted permission to build a line within the city limits.

LEBANON, N. H.—The Independent Telephone Company, of Lebanon, has asked for a franchise giving them the privilege of establishing telephone service in this place.

PLAINFIELD, N. J.—The Northeastern Telegraph & Telephone Company has paid the Fanwood Township Committee $1,000 for the privilege of stringing its wires through the lower end of the township.

BONHAM, TEX.—The city council has granted a franchise to the Phenix Telephone & Telegraph Company. Twenty-five or thirty telephones will be installed at once.

COMBINATIONS.

BAINBRIDGE, GA.—The Bainbridge Telephane Exchange has been sold by W. W. Collier to a party of local capitalists, who will at once incorporate, improve and extend the system. The construction to be about $15,000.

PITTSFIELD, ILL.—The Farmers' Telephone Company and the directors of that part of the Orr Telephone System south of Griggsville, have made arrangements for the consolidating the two companies.

BRISTOL, IND.—F. H. Hilbush, of Bristol, has become sole owner of the Bristol Telephone Company. No expense will be spared to make the exchange as complete as can be found in many larger localities.

MOULTON, IA.—C. A. Mann has purchased the local telephone exchange. Improvements will be made.

ST. PETER, MINN.—Negotiations are under way for the consolidation of the Nicollet County Telephone Company and the St. Peter Telephone Exchange. The Nicollet County system is valued at $25,000 and it has 125 miles of country line. The St. Peter plant is valued at $35,000 and operates 415 telephones. It is now owned by James Bennett of this place.

HALCOTTSVILLE, N. Y.—The Standard Telephone Company is endeavoring to lease or buy telephone lines in this vicinity.

NEW COMPANY NOTES.

HUNTSVILLE, ALA.—The planters in the neighborhood of Green Grove have organized a mutual telephone company with $2,000 capital.

LAWRENCEVILLE, ILL.—The Star Line Telephone Company, of Lawrenceville, has been incorporated with a capital stock of $100,000 by Henry M. Knipe, I. S. Abbott and A. L. Maxwell.

OCOYA, ILL.—The Eppard's Point Telephone Company has been incorporated with a capital stock of $2,500 by W. E. Fisk, W. W. Osborn, W. Wagner.

INDIANAPOLIS, IND.—The Ekin Mutual Telephone Company has been incorporated with a capital stock of $12,000. The company proposes to establish and operate a telephone exchange and system in Ekin, Tipton and Hamilton Counties. The directors are: W. A. Tippin, William Price and W. F. Small.

WILMOT, IND.—The Wilmot Mutual Telephone Company has been incorporated with a capital of $10,000 to operate telephone exchanges at Cromwell, North Webster and Wilmot, in Noble County. The officers are: H. T. Klein, president; G. S. Banse, vice-president; L. R. Gerard, secretary and treasurer, and A. L. Johnson, manager.

DEFIANCE, IA.—The Defiance Telephone and Electric Light Company has been incorporated with a capital stock of $15,000.

MANNING, IA.—The Manning Telephone Company has been incorporated with a capital stock of $2,500, by W. B. Swaney and others.

CORYDON, KY.—A new telephone system is being built by O. S. Wright which will connect about 300 subscribers with Corydon and Fall City.

RALEIGH, MISS.—The Smith County Telephone Company has been given power to operate in all of the towns and villages of the county. The directors of the company have secured a right-of-way and the work of putting up the lines will be commenced in a few days.

LANSING, N. Y.—The Farm and Village Telephone Company has been incorporated with a capital stock of $20,000, by R. Miller, Rensselaer Miller, of Lansing, N. Y., and Ivan Miller, of Groton, N. Y.

MONTGOMERY, N. Y.—A meeting has been held at this place to take steps for the organization of an Independent telephone company in this village.

DUNDEE, MICH.—The Monroe County Telephone Company, of Dundee, has been incorporated with a capital stock of $15,000.

FREMONT, MICH.—The Dayton Center Telephone Company, of Fremont, has been incorporated with a capital stock of $2,000.

NORVELL, MICH.—The Norvell & Manchester Telephone Company, of Norvell, has been incorporated with a capital stock of $375.

HENDERSON, MINN.—The Henderson Telephone Company has been incorporated with a capital stock of $10,000 by Hans Ems, W. H. Leeman, Lionel A. Guilbert, John F. Dempsey, Phil. J. Hemler, Allois W. Heberle, August Ney, Alfred C. Blasing, and William N. Theissen.

ROTHSAY, MINN.—The Rothsay Telephone Company has been incorporated with a capital stock of $10,000. Work has been begun on the construction of a new line to Lawndale.

ARCADIA, MO.—The Arcadia and Drywood Telephone Company has been incorporated with a capital stock of $750.

MONROE CITY, MO.—The Farmers' and Merchants' Telephone Company has been incorporated with a capital stock of $3,000 by J. H. Gentry, J. Kendrick, F. E. Orr, C. L. Elzea, J. T. Spaulding, T. B. Boulware and others.

SENATOBIA, MISS.—The Tate County Telephone Company has been chartered to do business here. Incorporators: J. F. Brewer, Phil A. Rush, and others.

GREAT FALLS, MONT.—The Cascade County Rural Telephone Company has been incorporated with a capital stock of $5,000. The directors are: Duncan Cameron, Cuno Jaekel, W. F. Kester, John Mainland, C. F. Stork, E. B. Judd and Andrew Thisted.

CHAMPION, NEB.—The Chase County Telephone Company, of Champion, has been incorporated with a capital of $10,000.

ASHEVILLE, N. C.—The Franklin Telephone and Electric Company has been incorporated. The Piedmont Electric Company is interested and can be addressed for information concerning the enterprise.

FRANKLIN, N. C.—The Franklin Telephone & Electric Company has been incorporated with a capital stock of $15,000, by J. S. Trotter, Samuel L. Kelly, of Franklin; J. H. Weaver, and W. M. Farr, of Asheville.

COLUMBUS, OHIO.—The Franklin County Telephone Company, capital stock $150,000, has been incorporated with headquarters in this city. The lines of the company will have their termini in the villages of Westerville, Gahanna, Worthington, Galloway, Groveport, New Albany, Dublin, Hilliards, Lockbourne, Harrisburg, Reynoldsville, Flint, Alton, Amlin, Black Lick, Brice, Central, College, Elmwood, Hayden, Pleasant Corners and Pickerington and Lithopolis in Fairfield County, with branches to Africa and the Girls' Industrial Home in Delaware County. The company in the future will extend the wires to other sections.

HALLSVILLE, OHIO.—The Colerain Telephone Company has been incorporated with a capital stock of $10,000 by P. D. Robinson, A. S. Haag, A. H. Clark, T. P. Sloan and E. A. Reed.

ENID, OKLA.—The Enid Rural Telephone Company has been chartered with a capital stock of $30,000 The incorporators are: J. S. Brooks, J. P. Maddox, and H. G. Horner, all of Enid.

FOSS, OKLA.—The Northwestern Telephone Exchange, of Foss, has been incorporated with a capital stock of $5,000, by S. H. James, Emma James, Etta James and O. H. James.

FREDERICK, OKLA.—The Frederick Telephone Company has been chartered with a capital stock of $5,000. The incorporators are: A. X. Campbell, J. M. Bellamy and W. C. Shaw, all of Lawton.

Digitized by Google

ST, STEPHENS, S. C.—The Berkeley Telephone Company, of St. Stephens, has been incorporated with a capital stock of $1,500, by W. A. Floyd, W. R. Russell, G. Rittenberg and W. A. Bunch.

HUNTINGDON, TENN.—The Consolidated Telephone and Telegraph Company has been granted a charter. The incorporators are: J. K. Barlow and J. F. Barlow, of Savannah; T. S. Hughes, of Clifton; F. E. Schwab, of Nashville; H. B. Stubblefield, of Denson's, and W. N. Sloan, of Linden. The capital stock is $50,000. The company will operate lines in Perry, Wayne, Hardin and adjoining counties.

JUNCTION CITY, TEX.—The Junction City Telephone Company has been incorporated with a capital stock of $5,000, by T. B. Phillips, M. E. Blackburn and T. J. Bailey.

TOLUCA, VA.—The Toluca and Fredericksburg Telephone Company has been organized, with Hugh Adie, president; C. A. Bryan, secretary; the Conway Gordan Garnett National Bank, of this city, treasurer; M. K. Lowry, N. B. Musselman, E. S. Moore, R. J. Payne, R. A. Moncure and Wesley Knight, directors. The company will put in a telephone line to run from Toluca by Garrisonville, Stafford Court House, Brooks Station and Boscobel, to Fredericksburg.

WINCHESTER, VA.—Application has been made to the corporation commission for a charter for the Frederick & Shenandoah Telephone Company, with headquarters in this city.

BEE, W. VA.—The Bee Telephone Company has been organized.

HOLLANDALE, WIS.—The Ridgeway, Jonesdale, and Hollandale Telephone Company has been incorporated with a capital stock of $2,000, by Robert Brunker, William Kramer, Thomas Conway, P. A. Peterson, and Even Johnson.

SHAW, WIS.—The Shaw Telephone Company, of Eau Claire County, has been incorporated with a capital stock of $5,000, by Charles Seguire, Ira Ives and Nels M. Johnson.

PERSONAL.

J. W. SMITH, of Washington, Ia., has been appointed manager of the Union Electric Company's exchange at Moline.

MISCELLANEOUS.

DARDANELLE, ARK.—The Arkansas Telephone Company, of this city, has recently completed its connections to Little Rock and Fort Smith and is giving excellent service.

NEW HAVEN, CONN.—Five hundred members of the Telephone Employees Mutual Benefit Society, of Connecticut, enjoyed their eleventh annual reunion at Savin Rock recently.

PALMYRA, MO.—The Big Four Telephone Company held a business meeting here recently to discuss extensions and improvements to the system.

QUINCY, FLA.—The Central Telephone exchange, of this city, was destroyed by fire recently.

BLOOMINGTON, ILL.—Preliminary plans have been formed for the organization of the Central Illinois Independent Telephone Association, and a committee appointed to form plans for a permanent organization.

WATERLOO, IOWA.—The Iowa Telephone Company has secured a site for an exchange building and will take bids for the building at once.

SARANAC, MICH.—The Saranac Telephone Company is making preparations to extend its system in the near future.

WINDOM, MINN.—The Twin City Telephone Company has completed a new line between Mankato and Windom.

ALTON, MO.—The farmers in this vicinity have petitioned the city council for a franchise to operate a telephone system.

LA BELLE, MO.—The new directory of the La Belle Telephone Company shows twice as many subscribers as did the old one.

HIMROD, N. Y.—The route of the Himrod Telephone Company, as now outlined, will include the towns of Dresden, or Geneva, Keuka, and Dundee, and connections with Penn Yan. It is intended to include the territory east of Seneca Lake and also to run the lines to Keuka Lake.

BEATRICE, NEB.—The Home Telephone Company has received five miles of cable, which will be used in extending its system in this city.

FULLERTON, NEB.—The Citizens' Telephone Company has placed in operation a new line to Timber Creek, and also a direct metallic toll line to Palmer.

SALEM, N. J.—The Pine Grove Rural Telephone Company recently organized, has disbanded, and the incorporators have purchased stock in the People's Rural Telephone Company, of Swedesboro.

GLOVERSVILLE, N. Y.—A recent electrical storm badly damaged the toll lines of the Glen Telephone Company.

MARTINS FERRY, O.—Hunter S. Armstrong has been elected president; Geo. H. Walters, vice-president, and Wilmer Steer, secretary, of the Ohio Valley Telephone Company. The system will be generally enlarged and improved.

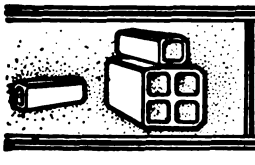
SAWYERVILLE, QUE.—The Canadian Telephone Company held their eighth annual meeting recently. The company operates in the counties of Compton and Lake Megantic. Mr. G. G. Hurd is president, and A. Adam, vice-president.

BROOKINGS, S. D.—The Thompson Caldwell and Wilson Telephone Company has now eleven rural lines in working order.

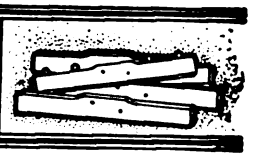
UNDERGROUND.

SPRINGFIELD, ILL.—An ordinance has been introduced into the city council requiring underground construction for telephone and other electrical wires.

MEMPHIS, TENN.—The city authorities are taking steps to enforce strict compliance with the law compelling underground wires in the fire districts. It is stated that the Memphis Telephone Company and the American Telephone and Telegraph Company have not complied with the requirements of the law.



New Construction in the Field



RIFLE, COLO.—The Western Slope Telephone Company is changing its lines from grounded to metallic circuits.

DE LAND, FLA.—The De Land Telephone Company will extend its lines to Beresford.

ALTON, ILL.—It is probable that the Fosterburg, Bethaldo, Brighton & Wood River Telephone Line will be constructed into Alton. A representative of the company applied to the city council for a franchise recently.

ALTON, ILL.—The Kinloch Telephone Company will construct a new toll line from Alton to Jacksonville. It will be ready for operation in the fall.

FOSTERBURG, ILL.—John S. Culp, of this place, is the leading spirit in a new company which will soon be organized to construct rural lines.

HILLSBORO, ILL.—The Montgomery County Telephone Company is making arrangements to install a toll and long distance switchboard.

KANKAKEE, ILL.—The Interstate Telephone Company is rushing work on the extension of its telephone system in this city.

OREGON, ILL.—The Ogle Telephone Company is overhauling its system between here and Rochelle, and also between Mt. Morris, Forreston, and Polo.

DOMESTIC, IND.—Fifteen farmers living near Domestic have organized a company and will construct rural lines connecting their farms. They also intend to make connection with the Independent telephone lines at Domestic.

CEDAR FALLS, IA.—The Iowa Telephone Company will rebuild the local system throughout.

SIOUX CITY, IA.—An agreement has been reached by the Sioux City Telephone Company, the New Yankton Telephone Company, of Yankton, S. D., and the Bruce telephone lines, reaching a number of smaller South Dakota points, and the Ward lines will be connected. New lines will be constructed to Aberdeen, Mitchell, Watertown, Brookings and all the principal towns east of the Missouri River in South Dakota. Connections will also be made with all principal cities in northwestern Iowa.

BOWLING GREEN, KY.—The Home Telephone Company has nearly completed its new line from this city to Scotville.

SMITHLAND, KY.—Citizens of Salem and vicinity will construct an exchange in that town. The People's Independent Telephone Company, of this place, will furnish pole connections. J. P. Roney will probably be manager at Salem.

BIDDEFORD, ME.—The Saco and Biddeford Telephone Company will extend its line.

TAUNTON, MASS.—The Farmers' Telephone Company is building a line from Middleboro to Lakeville.

ALBERT LEA, MINN.—The local telephone company is preparing to reconstruct its system.

CALEDONIA, MINN.—The Standard Telephone Company has decided to replace its present switchboard with a new 250-drop board.

CROOKSTON, MINN.—The farmers of Pleasant View and Green Meadow will construct a line from Ada to Gerry, taking in the intermediate points.

DULUTH, MINN.—The Zenith Telephone Company is engaged in enlarging and improving its plant, involving an expenditure of between $75,000 and $100,000. When the work is completed the company will be in a position to handle a total of 3,500 subscribers, it having at present about 2,500 on its books. A new switchboard is being installed and a complete party line system is also being put in.

NEW LONDON, MINN.—The citizens have organized a telephone company and will install a local exchange.

ST. FRANCIS, MINN.—A telephone line will be constructed from here to Lake George.

WINONA, MINN.—The Winona Telephone Company is installing a new long distance switchboard.

ULEN, MINN.—C. Paulsen will construct a local telephone system.

BILLINGS, MONT.—The Mutual Telephone Company, of this city, will build long distance lines practically covering the western part of Carbon County. The line will start from Red Lodge and take in all the small towns along the Stillwater. It will also be extended into Sweet Grass County as far as Nye.

LINCOLN, NEB.—The Automatic Telephone Company has commenced building a new line to Yankee Hill and Burnham.

BATH, N. B.—The Bath Consolidated Telephone Company, is extending its system by the construction of forty miles of new wire from Kilfoyle Settlement to the border of Northumberland County.

MONCKTON, N. B.—The Kent Electric Company will build new telephone lines from Richibucto to Rexton, Buchtouchi, Kauchibouguac, Harcourt and other points in Kent County. Also along the line of the Kent Northern Railway to Kent Junction.

ST, STEPHEN, N. B.—The New Brunswick Telephone Company is building a new exchange here.

DARIEN, N. Y.—The Darien Telephone Company has connected the Corfu exchange with East Pembroke. Two other lines to Darien, and a third to Alexander are contemplated.

OCEANA, MICH.—The Lake Shore Telephone Company will install an exchange at Pentwater.

GENEVA, N. Y.—The Geneva Telephone Company has connected Flint Creek and Hall's Corners with this exchange. Work is now being pushed on lines south of the City. Several other lines are contemplated and work on reconstruction will be pushed.

MILFORD, N. Y.—A local telephone line is contemplated to connect this village to Oneonta.

OXFORD, N. Y.—The Oxford Valley Telephone Company is constructing a line between Brisben and this place. A line will connect with the Independent line from Norwich controlled by Mr. Marcus. At Brisben the new line will connect with an Independent line to Binghamton. The officers of the new company are George B. Fletcher, president; F. E. Beadle, vice-president, and M. T. Whitney, secretary and treasurer.

BRINSMADE, N. D.—E. F. Edwards will construct a local system.

FREEBORN, N. D.—Citizens residing in the neighborhood of Freeborn and Morris are considering the advisability of building a telephone line to connect with New Rochford.

MARION, OHIO.—The Marion County Telephone Company has decided to immediately build a plant at Waldo. The company has a line from this city to Waldo and will immediately install an exchange at that place, which will serve the surrounding villages, including Ashley and Cardington.

NORWALK, OHIO.—The local telephone company is enlarging its plant and building a new line from the Heights to Milan.

BOOK NOTICES.

"TELEPHONE PRINCIPLES AND PRACTICE." By George Walker Wilder, Ph. D., Assistant Professor in Electrical Engineering, at the Armour Institute of Technology, Chicago: Cantwell Printing Co., Madison, Wis. 450 pages. 375 illustrations. Price, $2.00, postage paid.

The latest contribution to manuals of telephony is the volume by Professor Wilder. The first six chapters are devoted to an exposition of the fundamental principles of electricity and magnetism, which underlie the construction of all telephone apparatus, and in the course of this matter, Professor Wilder explains the fundamental principles of the subject in a manner to be easily comprehended by non-mathematical students. In Chapter VII. the early forms of telephonic apparatus are described, while Chapters VIII. and IX. take up the modern receiver and transmitter. In Chapter X. the principles of induction are treated, these pages forming an introduction to the succeeding chapters on induction coils, the magneto generator and the magneto bells; then, under the titles of hook switch and instrument circuits, the author describes the various forms of substation apparatus.

The next portion of the book is devoted to exchange systems and switchboard apparatus, in which the various switchboard circuits of both magneto and common battery and the methods adopted for party lines are treated at some length. Following comes a description of the construction of telephone lines, with paragraphs upon poles, wire, and other appliances which are used for the purpose. Finally the book concludes with a chapter giving some estimates upon the cost of line construction. On the whole, a valuable review of the subject is presented, written in a clear and non-technical manner, with a style which is likely to attract the bulk of workers in the telephone field. The illustrations are well chosen to fit the subjects presented, and as a large proportion of them are half tones, they are conspicuous for the pleasing effect which is produced.

We believe that the volume will find a wide and ready market among the thousands of wire chiefs and construction men who are contributing to the rapid growth of telephony in this country, and who with American keenness, are anxious for a wider and more complete knowledge of their business. To these we commend the volume and refer them to page ? ? for additional details.

TRADE NOTES

THE BAIRD MANUFACTURING COMPANY, of 4 Michigan street, Chicago, has shipped three hundred pay stations to Kansas City this month. This is encouraging and looks as though Missouri knew a good thing when they saw it.

THE AUTOMATIC TELEPHONE EQUIPMENT COMPANY, of Boston, Mass., has recently issued a booklet setting forth the advantages of its telephone apparatus. This brochure is tastefully gotten up and contains a large amount of information. To parties interested it will be mailed upon request.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., and Chicago, Ill., has recently closed contracts for switchboards with the following companies: Pfister Vogel Leather Co., Milwaukee, Wis.; Davis & Means, Delmar, Ia.; Fayette County Telephone Co., Fayetteville, Tex.; Shelby Telephone Co., Shelby, Mo.

THE J. W. MIDDLETON COMPANY, 167 Dearborn street, Chicago, Ill., wishes to draw the attention of the telephone field to the fact that it is placed in an exceptionally good position to furnish stock certificates, bonds, records, and all other kinds of printing necessary to the formation of telephone companies. The company will furnish all parties interested samples and prices of the various kinds of work it is its business to do. Special attention is drawn to the high-grade steel and copper plate engraving for stock certificates. The company will be pleased to answer all questions and furnish any further details regarding its business upon request.

THE F. BISSELL COMPANY, of Toledo, Ohio, is making a new type pot-head bracket, which, like its other line of pot-head sleeves and branches, takes the name "Security." The old style of pot-head block is never on hand when wanted; never adjustable; is special, and a lineman must always hunt a piece of lumber and make each block. The lumber is the only cheap thing about it. The method of fastening a wooden block is unsatisfactory. Linemen must stand on something, and these blocks break under their weight. This "Security" blacket is of malleable iron; is easily attached to the pole and is so built that it will stand heavy strain. The blacket clamps firmly on the cable without injury to the cable. The strain is put on the lead sheath and not on the pot-head. Linemen may stand or swing on this bracket without injury to it or themselves. Bracket is made in two sizes to fit any cable.

FOR SALE

Advertisements under this head, $1.00 for 25 words or less for each insertion. Prepaid.

FOR SALE—Several pieces of lead covered cable, in good condition, ranging from 15 to 150 feet in length; sizes, 50 pr., 100 pr., and 150 pr. Just the thing for small telephone companies bringing their lines into the office. Address, Box 224, THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 224

FOR SALE CHEAP—Five switchboards of magneto express type, in good condition. Just the thing for small exchanges. Address, Box 225, THE AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 225

WANTED

Advertisements under this head, 25 cents for 25 words or less for each insertion. Prepaid.

American Telephone Practice

By KEMPSTER B. MILLER, M. E.

518 large pages, profusely illustrated with 380 diagrams and cuts of apparatus **$3.00**

A book for the telephone man. It is an encyclopedia of useful information concerning telephony.

It gives complete specifications, enabling you to intelligently order apparatus from manufacturers, and to properly supervise the installation of an exchange, large or small.

It describes in simple language the theory and practice of modern telephony, including circuits, mechanical construction and operation of telephones and switchboards.

A complete description is given of storage batteries, their care and maintenance; of aerial and underground line construction, and, in fact, all the important matters which telephone men need to know.

Two Things Every Telephone Man Needs

They are the American Telephone Journal (published weekly), a year's subscription for $1.00, and a copy of the new and revised edition of "The A. B. C. of the Telephone"; a practical book for telephone men. This new edition has been brought thoroughly up-to-date, and sells for $1.00. By a special arrangement we will send a copy of the "A. B. C." and give a year's subscription to the American Telephone Journal—both for $1.50.

A New Series of Telephone Books, entitled

"TELEPHONY"

IN SIX VOLUMES

By ARTHUR VAUGHAN ABBOTT, C. E.

Four volumes are now ready. They embrace the following subjects:

Part I.—THE LOCATION OF CENTRAL OFFICES.
170 pages, 33 illustrations.

Part II.—THE CONSTRUCTION OF UNDERGROUND CONDUITS.
190 pages, 62 illustrations.

Part III.—THE CABLE PLANT.
152 pages, 51 illustrations.

Part IV.—CONSTRUCTION OF AERIAL LINES.
263 pages, 140 illustrations.

Two remaining volumes will be ready in October (Orders taken now). They are:

Part V.—THE SUBSTATION.

Part VI.—SWITCHBOARDS AND THE CENTRAL OFFICE.

The price of each Part is $1.50, postage prepaid. The price of the entire set (six volumes) is $6.00, postage prepaid.

FREE TO OUR SUBSCRIBERS

How You can Secure the Entire Set Free:

Send us 20 **new** subscribers to The American Telephone Journal at $1.00 each, a total of $20 00. We will then send you, all charges paid, the six volumes free.

How You Can Secure One Volume Free:

Send us 5 **new** subscribers at $1.00 each, a total of $5.00. We will then mail the volume you desire free.

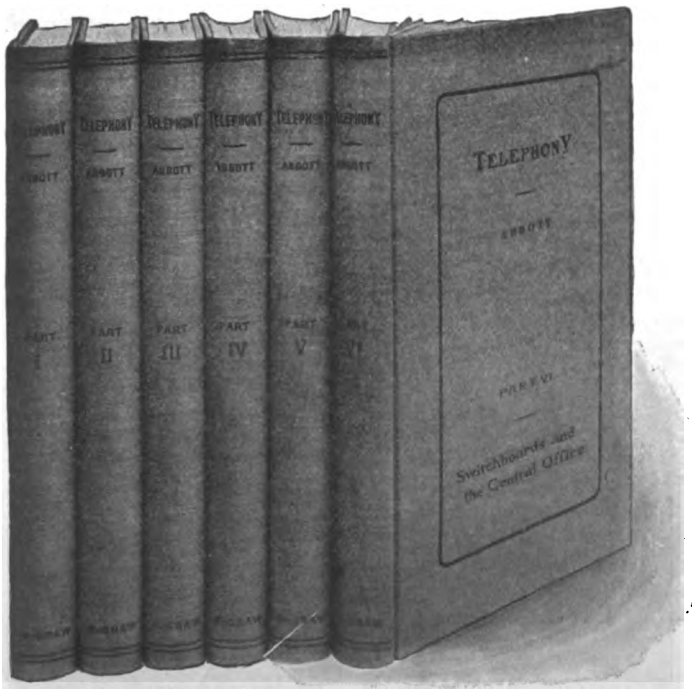
Another Way to Secure the Set:

For $7.00 we will give two yearly subscriptions to The American Telephone Journal, (one of which may be a renewal) and a complete set of six volumes.

For **$7.50** we will give three yearly subscriptions, one of which may be a renewal and a complete set.

For **$8.25** we will give four yearly subscriptions, one of which may be a renewal, and a complete set.

For **$9.00** we will give five yearly subscriptions, one of which may be a renewal, and a complete set.



THE PUBLISHERS IN ANNOUNCING THIS NEW WORK SAY:

"There is telephone literature galore that occupies itself with the discussion of the theory of receiver and transmitter, and a description of the various forms of apparatus used in building telephone exchanges. But there is little information that concerns itself with the engineering design of telephone plants. It is the attempt of the author in this series to prepare a manual that shall deal with the latter phase of the problem, with particular reference to a consideration of the economic features, which lead to the installation of the best plant for the least money."

Advise us at once which of these propositions you intend to accept, so that we can make the necessary arrangements.

Insulated Electrical Wires and Cables

ROEBLING

Bare Steel and Copper Telephone Wire

John A. Roebling's Sons Co.

TRENTON, N. J.

Agencies and Branches

NEW YORK CHICAGO CLEVELAND
SAN FRANCISCO PHILADELPHIA ATLANTA

I want to Lease a Telephone Plant in a live prosperous city.

One that is not earning up to expectations. Can make it pay good interest to owners.

I have references and money to back me.

For excellent reasons I would like to be addressed as

X. Y. Z.,

Care of The American Telephone Journal,

NEW YORK CITY.

OWING to the limited number of copies carried on file and the large demands, back numbers of THE AMERICAN TELEPHONE JOURNAL will hereafter be sold for twenty-five cents per copy.

THE AMERICAN TELEPHONE JOURNAL,

116 NASSAU ST. CITY OF NEW YORK

Bituminized Fiber Conduit
For Underground Construction

Combines the **good features** of other conduits. **Eliminates** the **bad features** existing in many kinds. **Has valuable features** not found in any other ducts. :: ::
Made in 7-foot lengths with male and female joints, making construction very rapid and simple, with consequent low cost. :: :: ::
Alignment is perfect and permanent without tedious care and skill required in laying of butt-joint conduits. Users are astonished by the ease and rapidity with which cables can be drawn in, and this without the slightest scratching or injury to the lead covering thereof. Made in sizes from 1-inch to 10-inch diameter. ::
Bends of any radius and any angle. :: ::
Write us for further information and prices, stating sizes and quantities required. :: :: ::

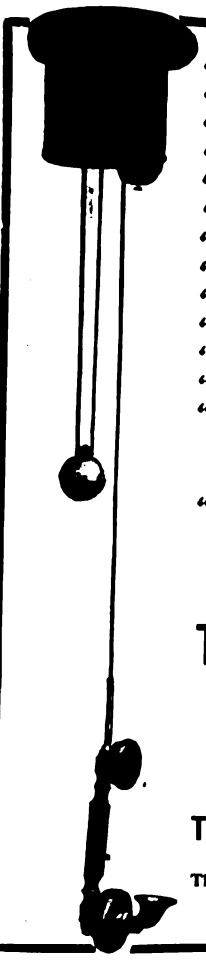
guaranteed to work as well after ten years' use as the day it was sold, It is free from side tones; positively will not pack—will not "fry" or "sizzle"—and will articulate distinctly always. Ours are guaranteed in every way to be the best made. But we don't have to ask a high price because we save on every item possible in manufacturing. And this without detracting from efficiency. So we can sell our telephones for less than you can buy elsewhere, and you have the added satisfaction of the best.

Write to-day for our new catalogue of telephones, switchboards and parts, sent free to any telephone company.

Julius Andrae & Sons Co.,

No. 945 West Water St., MILWAUKEE, WIS.



"It has no weight!
"Is it in a vacuum?
"No, it is nicely counter-balanced.
"Oh! it works up and down?
"Yes, and in any direction.
"And it hangs from the ceiling, eh?
"Yes, at any point—at your elbow.
"But it must get in your way?
"Not as much as your LIGHT does.
"Then you don't move to use it?
"Not an inch; and signal is automatic.
"But is it as good as other 'Phones?
"It combines all their good qualities with its own twenty-four exclusive advantages.
"Well, it sounds like a dream,—but you guarantee them? Sure? Then I'm going to ride with the band, and use

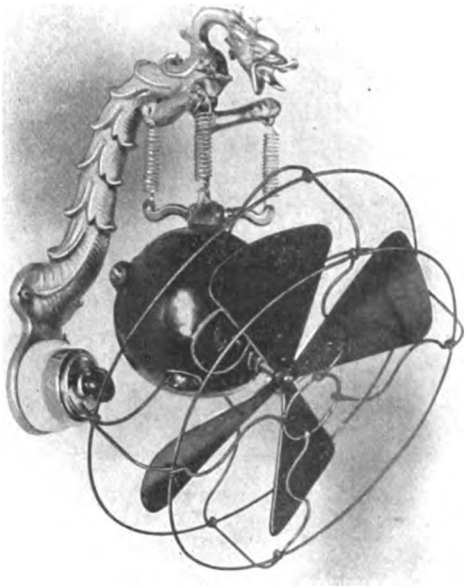
TELEPHONE BOOTH FAN MOTORS



The small "Wood" fan motor spring suspended from wall bracket is a model booth fan. A 3-pound motor, an 8-inch fan, 1200 r. p. m. and 20 watts produce a plenty of breeze and no noise or vibration.

Special motors for operation in series with incandescent lamp require 50 to 60 watts energy, and give light for booth and satisfaction to owner and user.

If you are interested, ask us—for more information. You may be planning to better your service next season—write now.

Cyclopedia of Applied Electricity

A Practical Guide for Telephone Men, Electricians, Mechanics, Engineering Students and All Persons Interested in Electricity ....

Special attention is paid to Telephone Work, one whole volume being devoted to this important branch of Electricity. The whole work, however, is of exceptional value to Telephone Men, fully explaining the Principles of Magnetic Induction, Calculation, Tests, Measurements, Common Battery System, etc. Prof. Crocker's treatises on Dynamo-Electric Machinery and Storage Batteries bear the stamp of highest authority. The whole field of telephone practice is thoroughly covered from the fundamental principles of Electricity to the complete installation and operation of both city and rural exchanges The editor of The American Telephone Journal in referring to merely one section of the work says:

"The section on Storage Batteries by Prof. Crocker of Columbia University, strikes us as being particularly good. It gives just the sort of storage battery information and tells it in just the sort of way that will reach the practical telephone man, who should at least have a good idea of this appliance which is now so common in these days of central energy."

Five Volumes—2500 Pages—size of pages 8 x 10 inches. Handsomely and durably bound in buckram, profusely illustrated with 2000 diagrams, full page plates, sections, tables, formulae, etc. Invaluable alike to the expert electrician and the apprentice. Every section written by an acknowledged authority. Prepared especially for practical, everyday use. A text-book and a reference work combined, as every volume is followed with a carefully prepared list of practical test questions to impress the important points on the reader's mind.

Special Half-Price Advance Sale

We are printing an edition for our own use. By increasing the edition we can make a great saving in cost of manufacture. We are willing to share this saving with those who will place advance orders **immediately**. The regular price is $25.00. We will distribute 1000 extra sets at the reduced cost of manufacture ***WHILE THEY LAST.***

$2.50 Paid Now secures this $25.00 Cyclopedia for just half price—$12.50 delivered, express prepaid. The full set of five volumes will be delivered to you as soon as it is off the press. Cut out the coupon below and mail to us. No further payment need be made until November 15th, when payment of balance at the rate of $2 00 per month must begin. **Order immediately. No sets will be sold at half-price after the edition goes to press.**

Some of the Writers

PROF. F. B. CROCKER, head of Department of Electrical Engineering, **Columbia University:** author of the sections on Storage Batteries and Management of Dynamo-Electric Machinery.

PROF. WILLIAM ESTY, head of the Department of Electrical Engineering, **Lehigh University:** author of the section on Alternating Current Machinery.

WILLIAM BOYRER, Telephone Expert and Consulting Engineer.

H. C. CUSHING, Jr., Wiring Expert and Consulting Engineer: author of the section on Wiring for Light and Power.

PROF. DUGALD C. JACKSON, Collaborator with **PROF. GEORGE C. SHAAD, University of Wisconsin:** author of sections on Power Transmission, Electric Lighting and Central Stations.

J. R. CRAVATH, Western Editor of the **Street Railway Journal:** author of the section on Street Railways.

PROF. LOUIS DERR, Mass. Institute of Technology.

CHAS. THOM, Chief of **Quadruplex Department Western Union Telegraph Co.,** author of section on Telegraphy, and others.

Partial Table of Contents

PART I.—Static and Dynamic Electricity—Primary Batteries—Ohm's Law—Wire Calculations—Electrical Measurements—Wiring for Light and Power—Electric Telegraph, including the Duplex and Quadruplex.

PART II.—Theory of Dynamo-Electric Machinery—Design and Construction of Dynamos and Motors—Types of Machines—Storage Batteries, including Theory, Management and Types.

PART III.—Incandescent and Arc Lighting—Electric Railways, including Car Wiring, Line Construction, Third Rail and Multiple Unit System—Management of Dynamo-Electric Machinery—Power Station Work—High Tension—Transmission.

PART IV.—Theory of Alternating Currents—Construction, Types and Operation of Alternators, Transformers, Induction Motors, Synchronous Motors and Rotary Converters.

PART V.—The Telephone—**Telephone Lines**—Circuits—Distribution—Line Construction—Distributing Points—Submarine Cable Lines—Cross Talk—Pupin's Load Coils—**Telephone Exchange**—Switchboards—Exchange Wiring—**Operation and Maintenance** Systems—Local Calls—Trunk Calls—Toll Boards and Lines—Long Distance Switchboards—Direct and Party Lines—Code Signalling—B. W. C System—Private Branch Exchanges—**Common Battery System**—Testing and Clearing Trouble—Wire Chief's Desk—Testing Circuits and Apparatus—Testing New Cables—Cutting into Service—Locating Faults—Replacing Defective Sections.

VOLUME 10 SATURDAY, SEPTEMBER 3, 1904 NUMBER 10

THE LARGEST TELEPHONE INSTALLATION AFLOAT

By Edward A. Tyler.

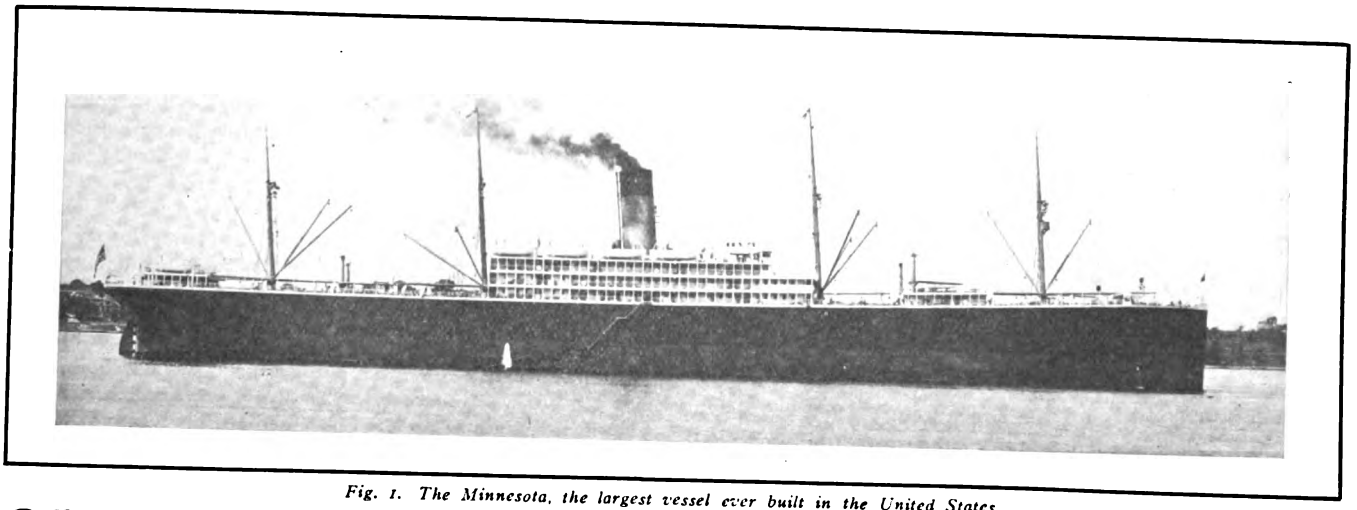

Fig. 1. The Minnesota, the largest vessel ever built in the United States.

On April 16, 1903, there was launched from the yards of the Eastern Shipbuilding Company, of New London, Conn., the largest mercantile ship ever built in this country and the second largest in the world, her only superior in size being the *Baltic*, of the White Star line. As the ship glided smoothly down the ways, Miss Clara Hill, daughter of Mr. Jas. J. Hill, christened her *Minnesota*. A view of the boat as she was leaving New London is shown in Fig. 1. This great vessel will ply between Seattle and Tacoma, on Puget Sound, and ports in China, Japan, and the Philippines. She is owned by the Great Northern Steamship Company.

Of special interest to telephone men is the fact that the largest telephone system ever placed on board a vessel is installed on this steamship. There are two distinct installations; one, the general, which is a regular exchange, the other an intercommunicating system, which connects with the executive offices of the ship. Both systems were furnished by the Electric Gas Lighting Co., of Boston. The exchange of the general system is placed in a separate room in the after part of the vessel and consists of an 150-line switchboard mounted in a light oak cabinet to match the general surroundings. Figs. 4 and 5 will give a good idea of the appearance of the switchboard and its interior mechanism. The system employed is central energy and is a combination annunciator, with telephone attachment. The signals are similar to the well-known annunciator targets and are mounted in six rows of 25 signals in each row behind a glass plate. Under each vertical row is placed a reset handle for restoring targets to their normal positions. Below are mounted the jacks associated with the lines, and under these are the supervisory signals of the cord circuits, of which there are 15. Each pair of cords has a listening key and also two push buttons for ringing in either direction. The signal bells of the telephones are of the vibrating type and are rung with direct current. An additional drop and jack is mounted upon the board, which can be connected by means of a flexible cord with the city system of any port at which the vessel may stop. For this a generator is provided for signalling. In this manner it will be possible for the captain of the vessel to communicate directly with the agents of the ship without leaving his cabin.

Fig. 2. Water-tight telephone for exposed positions.

Every stateroom on the vessel has a telephone, and it is possible for a passenger to lie in his berth and order his meals from the steward's department. A novel feature of this system is when

Digitized by Google

more than two parties wish to talk together. A special connecting key is so arranged that two pairs of cords can be connected together so that four parties can hold a general conversation without interfering with any other connections that are made. There are two of these keys, one associated with the first two pair of cords, the other with the second two pair of cords.

Fig. 3. Marine Telephone on Forward Bridge.

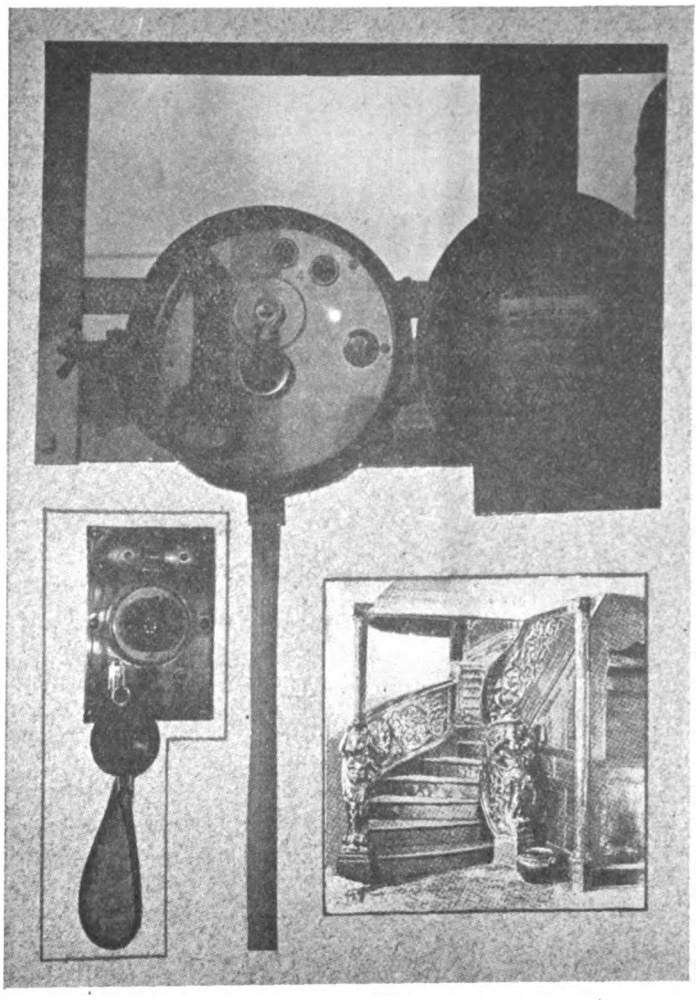

Fig. 4. General System Instrument. An Interior View of the Vessel.

The wiring of the system has been done upon a three-wire plan, that is, three wires run to each telephone. Of these, one is common, one a talking wire and one a signal wire. The operation is as follows: As soon as a call is received a plug is inserted in the jack of that line and if the supervisory signal lights up, it indicates the party wishes to talk. Otherwise the signal is received as a regular call for a steward. Should the party calling wish to talk with some one else, the connection is made in the usual manner.

Besides the instruments in the staterooms, telephones are installed in almost every part of the vessel, such as the captain's private stateroom, the ladies' drawing room, the smoking room, library, kitchen, pantry, steward's department, laundry, chief engineer's office, chief electrician's office, so that no matter what a passenger's wants may be, he can be connected with the department desired. The instruments are set flush with the walls and are finished in black. Watch-case receivers are used, and the transmitters are of the solid-back type. Fig. 4 will give a general idea of the appearance of the telephones.

The intercommunicating system is distinct from the general system and consists of eleven stations, as follows: The forward navigating bridge, main navigating bridge, after navigating bridge, port and starboard engine rooms, crow's nest, pilot house, chief engineer's office, chief electrician's room, central electric lighting station, and dynamo shelf. Of these, the first five are water-tight marine type instruments, similar to the one illustrated in Fig. 2. This construction is necessary on account of their exposed position to moisture and dampness. In Fig. 3 is shown the one situated on the forward navigating bridge, which connects with the main and after navigating bridges. Attention is called to the unique construction of the instrument. The exterior consists of a copper shell. On the inside is a ridge upon which a plate carrying the mechanism is fastened by means of screws. Between the plate and the ridge is placed a rubber gasket and, as a further precaution, the screws fastening the plate to the rubber are provided with rubber insulating bushings. The receiver cord is covered with a rubber tube and a rubber earpiece is provided for the receiver, this being necessary on account of the noise or the rushing sound of the wind when the vessel is traveling fast. Another unique feature is the hook-switch. The hook upon which the receiver hangs is a dummy support, the switch itself being shown to the right of the plate. It is operated by the cover, so that when the cover is closed the circuit of the telephone is open and when the cover is open, the telephone circuit is closed. An interesting feature is the fastening mechanism which holds the cover to the front of the box. The pitch of the thread of the thumbscrew and locking bolt is made quite coarse, so that it can be rapidly unfastened and thus save time in the case of an emergency. These instruments, as will be noted from their position, connect with the vital parts of the ship, and, in consequence, their operation must be as nearly perfect as possible. The position of the instrument in the crow's nest is worthy of passing note. The crow's nest is a sort of platform placed high up on the forward mast and is used as a lookout point for observation, being so far forward and so much higher than any other observation point that the lookout in the crow's nest can distinguish objects further off and much more quickly than can a lookout at any other point. Consequently, he is able to communicate with the officers in charge as soon as he notes anything out of the ordinary, and, having a telephone, can do so with much more certainty than would be the case were he to have to call out his observations, as is generally the case.

Fig. 5. General System Switchboard.

Digitized by Google

A brief description of the *Minnesota* is herewith given that may prove of interest to some of our readers. The extreme length of the vessel is 630 feet and beam 73 feet 6 inches. The height, measured from the main navigating bridge to the keel, is in the neighborhood of 130 feet. As figures sometimes fail to convey the size of the object that is being described, we would suggest that our readers measure off similar distances to gain a better idea of this immense vessel.

The necessary driving power is furnished by 16 water-tube boilers which deliver steam at a pressure of 230 pounds to 2 sets of triple-expansion engines, which develop about 10,000 horse-power. These engines drive 2 screws at about 78 revolutions per minute, at which speed the vessel is traveling between 14 and 15 knots.

There are 8 decks, 5 in the hull proper and 3 in the superstructure. The dead weight cargo capacity is 30,000 tons. The anchor chains are said to be the heaviest ever forged, each link weighing 95 pounds. All the auxiliary apparatus, such as hoisting machinery and refrigerating plant, is electrical, this vessel having the largest generating plant ever installed on shipboard. Six 75-k.-w. generators furnish current at a potential of 125 volts. There are 720 motors, which range in size from one-eighth h.-p. to 100. The steering gear is operated by electric motors, as are all winches and other machines usually run by steam on board war ships. To look after this large amount of electrical machinery, there are six electricians, in charge of one chief electrician, Mr. Stilman H. Conner.

In closing, it may be interesting to note the application of electricity to the comfort of the passengers. The fans, which supply hot and cold air and also exhaust, are run by electric motors. In the kitchen, toasting, broiling and stewing are done by means of electric heaters. In the staterooms, electric curling-irons are provided for the comfort of the women passengers. In the laundry department, the irons are heated by electricity, and electric heaters are provided for every stateroom, three variations being possible — low, medium and full. Throughout the ship wherever electricity could be employed it has been used, it being the idea that more efficiency could be secured by its use than by any other means.

Fig. 6. Showing Wiring of Switchboard.

James J. Hill.

Besides being the largest vessel ever built in the States, the *Minnesota* will also possess the additional distinction of being the largest vessel that ever sailed upon the Pacific, far eclipsing any other boat upon this ocean.

After the vessel's speed trial she will load with 10,000 tons of coal at Newport News, Va., and will proceed by way of Cape Horn to San Francisco. On the way a stop will be made at Coronelle, in Chile, for coal, and the *Minnesota* will probably reach San Francisco in fifty days, and Seattle a week later. Although not subsidized by the United States Government, special provisions have been made for the carrying of between 1,400 and 1,500 troops, so that if at any time her services are needed, she will be immediately available as a troop ship. Besides this there are accommodations for a number of steerage passengers.

In conclusion, I wish to thank Mr. Sutherland, the traffic manager, and the officers of the ship for the courtesy extended in furnishing information.

A UNIQUE TELEPHONE PUBLICATION

OUR esteemed contemporary, *The Electrical Review*, of London, informs us of a novel undertaking that has just been initiated in Paris, for the education of telephonic subscribers. In a general way when anything goes wrong with telephone service, the subscriber blames the company, and never for a moment considers that at least a portion of the difficulty might be attributable to his own carelessness. In France, however, it appears that the subscribers have recognized that perhaps a campaign of conduction among themselves might be productive of good results. So the subscribers in Paris have combined in an association that proposes to publish a journal which shall be largely devoted to pointing out the various means, whereby the subscribers themselves can co-operate with the telephone company in an attempt to expedite the service and to improve its efficiency.

To begin with, the Association has started out with the idea of arranging parties of subscribers who, from time to time, shall visit the central office and inspect the way in which a telephone system is carried on. This is certainly a grand idea, for if subscribers in general had a notion of how a switchboard is operated and what the avocations are that the operator must perform in order to make a connection, a much greater tolerance would be exercised and each would be able to aid the operator to an enormous degree. The company impressed with the endeavor of the subscribers to co-operate, exhibit statistics showing that in many cases complaints of poor service arose from failure on the part of the subscribers to properly observe the correct routine to obtain a telephone connection.

It was shown that subscribers would hang up the receiver after having called the exchange, and thus lose the connection they desired; and in many cases disconnections arose from the fact that the subscribers replaced the receiver on the hook prior to the completion of the conversation, or in some other way, accidentally or otherwise, gave the disconnecting signal. Frequently wrong numbers were given or subscribers made errors in obtaining the proper number from the directory. In fact, from a statistical standpoint it was shown that something over 60% of alleged errors arose from the failure of the subscribers to properly observe telephonic methods. The monthly Journal, which is to be issued, is to be devoted largely to explaining and teaching subscribers the various methods whereby the service may be improved by their co-operation. Certainly this is a unique undertaking, and one that can be of inestimable service to telephony by cultivating a proper spirit among subscribers.

We therefore extend a cordial welcome to the enterprise and wish it unbounded success. We believe that if some similar plan were taken up in this country, the number of complaints of poor service would be decreased by a remarkable percentage, and trust that some one may be found having sufficient altruism to take the initiative in an educational campaign.

MAINTENANCE

ARTICLE I.

By Arthur Benson.

THE term "maintenance," strictly speaking, means the keeping of a plant in proper working order. As applied to the telephone business, it embraces some branches of work that do not come under this definition. Also, it sometimes happens that certain classes of work, of a strictly maintenance nature, are not performed by the department whose especial duty it is to keep the plant in repair. In these articles, the various classes of work necessary to maintain the plant will first be considered, and the essential features of each studied. The most advantageous scheme of organization for the maintenance department will then be dealt with.

The work of maintaining the telephone plant is twofold: First, that of repairing damage comparatively slight in nature, which

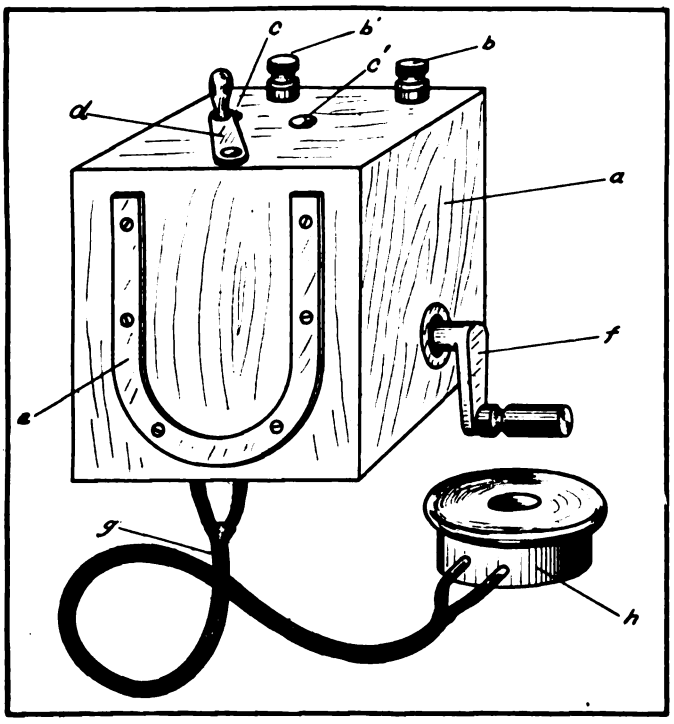

Fig. 1.

recurs continuously, and that of replacing the general wear and tear, which goes on gradually. This latter work is in the nature of rebuilding, and will therefore not be considered in this article.

The work of repairing the damage that occurs from day to day may be classed under four heads, according to the position of the plant affected. These headings are as follows: Maintenance of open wire lines; maintenance of subscriber stations; maintenance of cable lines, and maintenance of the central office apparatus. Under the first heading, the term "open wire lines" includes bridling cables and drop wires. Under the heading "subscriber station" is included the house wiring from the arrester to the telephone. As a general thing each one of these classes of work calls for the services of a man trained to its peculiarities. The maintenance of open wire lines, from its very nature, necessitates the services of a lineman. The maintenance of the subscriber station requires the employment of a man thoroughly familiar with the design and operation of the telephone, while men thoroughly familiar with the details of structure and operation of the central office apparatus are needed for its maintenance. In maintaining cable lines two classes of men are required: Those who locate the trouble and the men who clear it. The former class of work is performed by the galvanometer man; the latter, by the cable splicer.

The four subdivisions of the telephone plant, the open wire line, the subscriber station, the cable line and the central office apparatus, are subject to damage which is peculiar to each. And the troubles that occur have particular symptoms. For example, open wire lines are subject to damage by wind storms, lightning and mechanical injury generally. The apparatus at the subscriber station is apt to be broken by improper use, and it is possible to distinguish between a cross occurring on the line and at the subscriber station, or between a ground in the central office apparatus and one at the subscriber station.

No matter what the nature of the trouble may be, it can always be classed under one of the five following headings: "Open," "ground," "cross," "short circuit," miscellaneous."

Under the first heading are included all troubles which result from the continuity of the circuit being broken; under the second those troubles which result from an electrical connection with the earth. When two or more lines are thrown into electrical connection, they are said to be "crossed," while the term "short circuit" is used to denote the condition arising from both sides of a circuit forming mutual electrical contact. Under the head "miscellaneous" are included all other troubles.

In the following table will be found a list of troubles under their proper classification:

Swinging.	*Dead.*
Open.	
Cut-Out.	High Resistance.
	Heavy Line.
Ground.	
High Resistance.	High Resistance.
Noisy.	Noisy.
Solid.	Solid.
	Escape.
Cross.	
High Resistance.	High Resistance.
Solid.	Solid.
Short Circuit.	
High Resistance.	High Resistance.
Solid.	Solid.
Miscellaneous.	
Open.	
Cut-Out.	High Resistance.
	Heavy Line.
Ground.	
High Resistance.	High Resistance.
Noisy.	Noisy.
Solid.	Escape.
	Solid.
Cross.	
High Resistance.	High Resistance.
Solid.	Solid.
Short Circuit.	
High Resistance.	High Resistance.
Solid.	Solid.

A further classification of troubles can be made, with a view of denoting the portion of the plant affected. Thus, when located

Digitized by Google

on the line, the term "line trouble" is used, or "station trouble," to signify that the subscriber station is the point effected. When the fault lies in the central station apparatus the term "exchange trouble" is made use of. The following table will illustrate this point:

Line trouble.	Cable.
	Open wire.
	Bridle cable. Bridle wire.
	Cable box.
	Drop wire.
Station trouble.	Arrester.
	House wire.
	Telephone.
Exchange trouble.	Main distributing rack.
	Intermediate distributing rack.
	Coil rack.
	Relay rack.
	Repeater table.
	Composite rack.
	Switchboard.
	Exchange wiring.
Power apparatus.	Power switchboard.
	Fuse panel.
	Dynamos.
	Motors.
	Batteries.

Some companies further classify troubles according to the particular piece of apparatus affected, and this practice is useful in keeping the records of the maintenance department.

The Trouble Man.—The man whose duty it is to locate and clear open-wire line troubles, must be essentially a line man. He is distinguished by the appellation of "trouble man." Since it is often necessary for him, in the performance of his duty, to put himself into communication with the central office at various points on the line where no telephone exists, he carries as his essential tool a portable telephone, called a test box. This instrument is wired, as shown in Fig. 2. At *a* and *a'*, two binding posts, to which the line to be connected is attached. The binding post *a* is permanently wired to the heel of a two-way switch, *b*. One of the contact buttons of this switch, *d*, is wired to a magneto telephone, *e*, which can be used as both receiver and transmitter. The other one, *d'*, is wired to a magneto generator, *m*, which is connected in series with an 80 ohm buzzer, *n*. The opposite terminals of the receiver and buzzer are wired to the opposite binding post, *a'*. With the switch, *b*, in the position shown, the receiver, *e*, is connected to the line, and *m* and *n* are cut out. On the other hand, when the switch is thrown over to the contact, *d'*, *m* and *n* are cut in on the line, and *e* is cut out. The first position is for talking, and the second for signalling. This

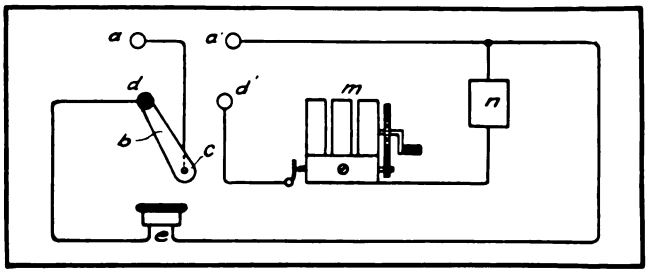

Fig. 2.

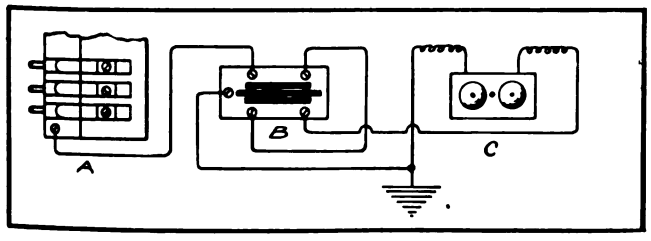
apparatus is mounted in a box, *a*, about 4 inches square, as shown in Fig. 1; the binding posts being shown at *b'*, *b*, the switch buttons at *c' c*, the switch lever at *d*, and the generator crank at *f*. At *e* is shown a U-shaped metallic clip fastened to the side of the box, for holding the receiver, *h*, when it is not in use. The box is usually equipped with a leather strap, not shown in the figure, which enables the "trouble man" to carry it over his shoulder. The receiver cord is shown at *g*. For convenience in climbing poles, the lineman should always be equipped with a pair of spurs. A pair of 6-inch and a pair of 9-inch pliers are all the additional tools that are required.

A CARBON GROUND DETECTOR

By R. H. Johnson.

A NUMBER of articles have appeared lately describing automatic fuse alarms for making known the presence of an open line fuse. A grounded carbon arrester will, on a grounded or common return system, render a line inoperative as effectually as an open fuse.

For a carbon ground alarm I have devised the arrangement shown in the accompanying diagram. *A* is the carbon arrester



ground strip. *B* is an arrester with a large carbon surface. *C* is an 80 ohm extension bell. The connections are clearly shown in the diagram. It will be noticed that the ground strip of the cable terminal is grounded only through the extension bell, while the arrester *B* has a narrow air gap, allowing lightning to jump across it directly to the ground without passing through the bell. The connections to *B* might be made in two or three different ways, but I believe the one shown in the diagram to be the best. This is also a good way of connecting this style of arrester to a grounded telephone, with the telephone in the place of the extension bell and the line in the place of the strip *A*. All connections should be made as direct as possible, with the exception of the wires to the bell *C*, which, if curled, will by virtue of the added self-induction, help to keep lightning out of the bell. As an additional precaution for the protection of the bell, a switch may be used to short circuit the bell during severe storms.

In case of a ground in any of the carbons the bell announces the presence of the ground, in a grounded or common return system, as soon as either the operator or subscriber attempts to ring on the line. On a metallic system ringing to ground, the bell would announce a carbon ground as soon as the operator attempted to ring on that side of the line. On a straight metallic ringing and talking line the alarm bell would not show up a carbon ground; indeed, it would not be as necessary that it should as in the other case, because a ground would not interfere with the signaling. When it is known that a line is grounded it may easily be found by connecting several cells of battery to the ground strip in series with a vibrating bell and running the remaining terminal over the conductors until the ringing of the bell shows up the grounded line. Time can be saved on this test by having more than one extension bell; say one for every 200 conductors.

In installing this device it is an additional advantage to have a switch to open the ground circuit between the ground strip and the bell while making tests for grounded carbons; otherwise a sufficient ground might be obtained through the 80 ohm bell to throw the drops if more than two cells are used in testing. On a common battery system the switch would be almost a necessity.

Digitized by Google

GRAPHIC RIGHT OF WAY RECORDS

By Harold A. McMann.

THE heterogeneous collection of records one sometimes sees in the offices of a telephone company are often plainly inefficient; the possibility of simplifying matters to a minimum never seems to enter into the heads of the officials in charge. Right of way records—that is, records showing the right of way previous to a pole line being built—prove to be no exception to the above state of affairs, and could be simplified so that the approbation of those using the system would be given unquestionably. The prevailing method of keeping the above record appears to be by either a book or card system, which does not, in the opinion of the writer, possess the merits of a graphic system, two examples of which are herein described.

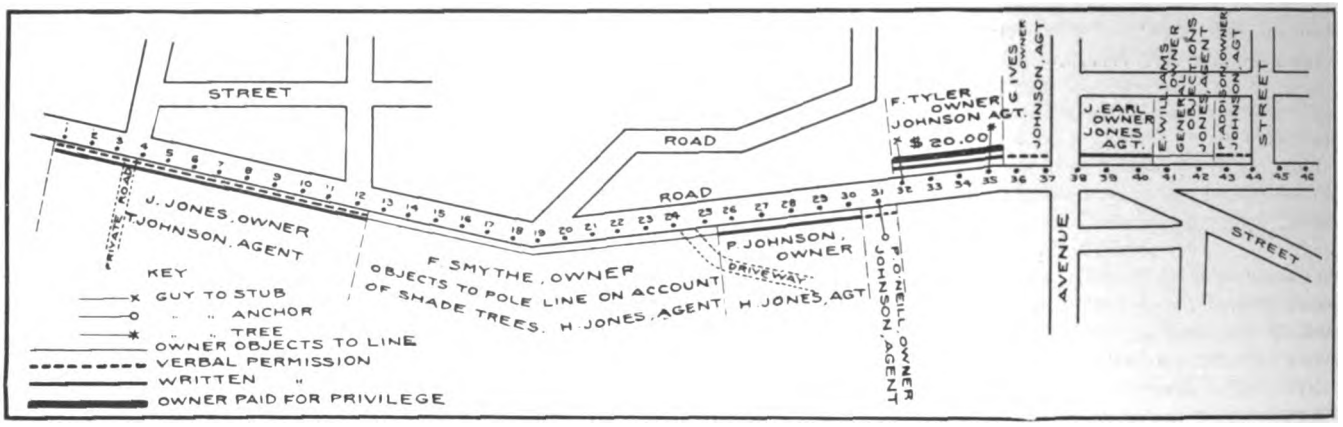


Fig. 1.

Previous to a pole line being built it is customary to make what is generally known as a "route map"; this embodies all the points of vantage and disadvantage along the proposed right of way that is to be secured. A typical map of this description is shown in Fig. 1.

The number and approximate location of the proposed poles should be marked on the map by a small dot; these, of course, should be consecutively numbered to avoid confusion and errors in the record.

We will now suppose that the right of way agent has secured, say, a verbal permit for poles 1 to 12; this is recorded on the map by a heavy dotted line, a thin dotted line being drawn down from the inclusive poles. If, later on, he secures a written permit for the same right of way a heavy line may be drawn under the heavy dotted line. Now suppose that from poles 13 to 25 he is unable to secure permits of any description; this condition is indicated by a thin line, and the approximate reasons for his being unable to secure it being written below. From poles 26 to 30 a written permit has been secured, the fact of which is shown by a heavy line together with the owner's name and the amount granted to him for the privilege.

Privileges for placing guys, stubs and anchors may be recorded by indicating a guy by a short line radiating from the pole; a stub by a small cross, and an anchor by a circle.

A guy to a tree is shown in a similar manner, with the exception of a small star being marked for the tree. The privilges are of course generally included in the ordinary right of way permit, and should not be shown until secured.

Payments as they are made for the privileges granted by the property owners are indicated by a very heavy line drawn under the others; this shows at a glance that that section of the line is O. K. It is a good plan when several agents are working on the line to put their names down adjacent to the respective rights of way secured by them. Lines of different colors may be substituted for the black lines mentioned above and would no doubt make the record easier to consult.

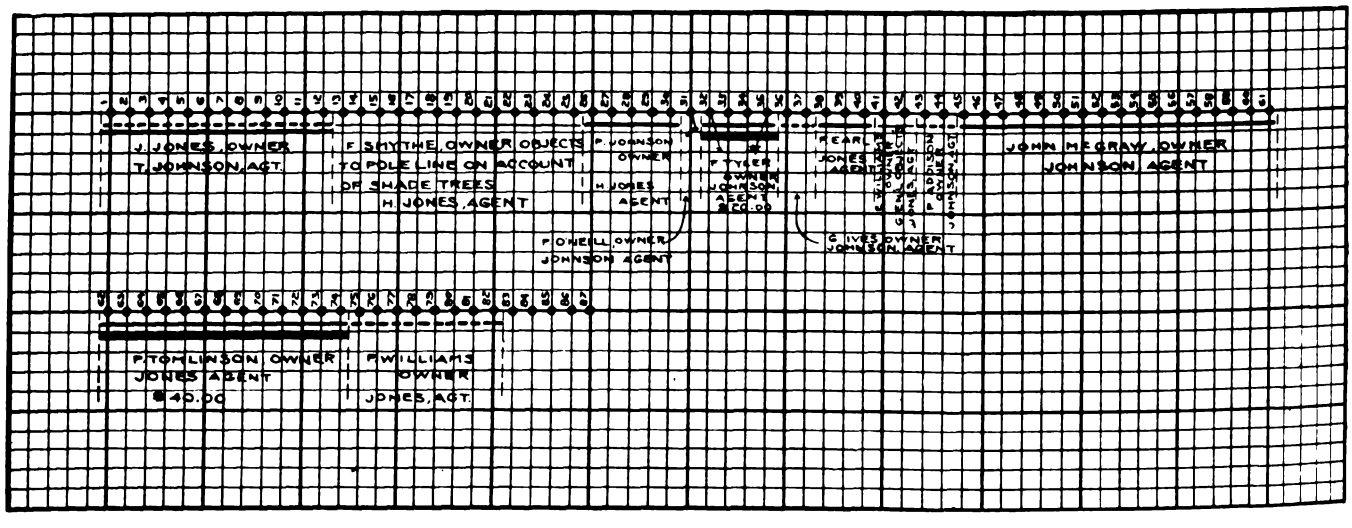

Fig. 2.

Variations are shown on the accompanying map which meet all probable conditions and show at a glance the state of affairs along the line at any point.

The second method of keeping a record similar to the above is shown in Fig. 2, which represents a sheet of ordinary section paper, each vertical line being allotted to a pole.

The numbers are run along to the end of the sheet, then continued below at a distance determined by the space required for owners' names, amounts paid and various other items that may be necessary. This scheme is simpler than the first, in the fact that no attempt is made to show the physical conditions of the line or country, and is easier to consult owing to the above named

Digitized by Google

eliminations. It is not unusual, however, in meeting special requirements to combine the two systems, thus forming an admirable combination. The advantages of these records are manifest. A set of maps or charts are far less likely to be mislaid or to have errors recorded upon them, as are cards or books; besides the system is very flexible, special conditions bringing forth ideas to the users that lend themselves to all possible contingencies in securing rights of way.

MR. CLAUSEN ON EXCHANGE ARRANGEMENT

THE writer notes, in your August 6th edition of THE AMERICAN TELEPHONE JOURNAL, page 86, an opinion on an exchange arrangement suggested by the writer in an article on pages 373-374 of the December 5, 1903, edition of THE AMERICAN TELEPHONE JOURNAL. Mr. B. C. Wilhelm takes exception to the writer's proposed exchange arrangement, suggesting that the arrangement is not in accordance with the most advanced practice.

When the writer prepared the article referred to, he endeavored to cover the subject in as brief a manner as possible, and allowed the two floor plan drawings to take up the major portion of the article; this for the purpose of permitting those not familiar with the designing of floor plans for telephone exchanges to obtain some idea as to the general requirements which it is necessary to meet. It now appears, however, as though the writer might have gone a little bit more into details.

Mr. Wilhelm states that the floor plan, as designed, is not in accordance with the most advanced practice, and qualifies this statement by saying that "one of the most potent factors in determining the nature of the floor plan is the probable growth." This objection should be effectually nullified when we read the last portion of the writer's article, from which the following is quoted: "The drawing is to scale, so that it will permit anyone to determine actual dimensions required for any portion of an exchange equipment having an immediate capacity of 2,400 lines, 120 lines per operator's position, and provisions for permitting an ultimate 100 per cent increase."

From the foregoing it will be observed that "*the most potent factor*" has been taken care of by assuming a 100 per cent. increase, and *no more*.

Mr. Wilhelm continues, and suggests that the toll board should should not lie at right angles to the main switchboard and that it should rather be placed on the position which the writer has assigned to the last two sections of the main switchboard. In other words, an increase in the toll board and an increase in the main exchange shall serve to decrease the permissible ultimate capacatiy of each of these two switchboards. And, as if on afterthought, Mr. Wilhelm discovers this fact, he states that when the main exchange reaches the point where the increase sections crowd the toll board, the toll board may be removed to another building. Aside from the bad arrangement resulting through placing the toll board in a portion of the exchange where the local exchange switchboards are required to be placed upon making future increases, we have also the undesirable arrangement introduced through not providing any means for permitting the switchboard men to easily reach the toll board from the first-floor terminal room—both objections being quite apparent to anyone familiar with exchange operation.

Quoting further from the writer's 1903 article, we have the following: "The toll switchboard has an immediate capacity of two sections, with allowance for an extension to an ultimate of four sections, or eight positions. . . . The arrangement of this toll board may be modified, and the number of sections installed may be increased by a slight rearrangement. The main object in view is to provide a room large enough for any probable extension in an exchange layout having an ultimate of 4,800 lines."

From the above, and by an examination of the floor plan, it will be observed that an increase in the number of toll sections is possible, but not considered a probable necessity. Mr. Wilhelm suggests that no *B* boards are shown, but that they are probably present in the main switchboard. This is not understood. Surely no B boards from branch exchanges are necessary when there are no branch exchanges.

However, in order to be a little more explicit as to the first section on the main switchboard being provided with two positions marked "Toll," it might be mentioned that one of these positions is ordinarly used only for trunking service from the toll board to the main switchboard. The remaining position, however, is provided for possible overflow in the trunking circuits, and also to meet a requirement often called for in the design of the medium size exchanges in which for night service the toll line terminals appear on the toll board, and operated from that point during the day, are transferred to the first position in the main switchboard for operation during the night.

Now, as respects the suggestion that the main switchboard should have commenced to read from a point near the first position of the toll board, it need only be necessary to draw Mr. Wilhelm's attention to the fact that in order to do this and not rearrange the first floor, would ultimately represent a cost for cable and labor of about $1,800. This to be added to the cost of the main exchange installation, which is quite an item, and one that Mr. Wilhelm evidently overlooked.

There is one other point which was overlooked in the criticism, and that is, supposing the main exchange is extended to the ultimate capacity assigned for it: We should have to figure on providing accommodation for about forty-five, if not fifty, operators. The locker room and operators' retiring room, it will be observed, is arranged only for a little over one-half of this number, and the writer might have added the suggestion to his 1903 article that when the main exchange reaches an ultimate of 4,800 lines, the toll room would have to be abandoned and located in another building, or on another floor of the same building, the locker room extended into the present operators' retiring room. This was the ultimate objective arrangement of the operating floor, though the writer originally did not deem it necessary to refer to this obvious possible change in the arrangement.

GAMBLING BY INJUNCTION.

IS "gambling by injunction" possible in Chicago? Mont Tennes, handbook "king," thought so when he obtained a temporary injunction from Judge Brentano restraining the Chicago Telephone Company from disconnecting the telephone switchboard in his poolroom at 823 Larrabee street, Chicago. The Schuettler gambling detail thought differently recently when it raided the place and bore the switchboard away in a patrol wagon.

"Stop," said Tony Francis, manager of the poolroom, when the riders broke down the door and wrenched the switchboard from its fastenings. "Better read that paper on the door before you go any further." The detectives ceased their attack on the switchboard and read the paper. It served notice that the telephone company was enjoined from removing telephone fixtures.

"Back to the switchboard," said Breternitz, leader of the raiders, when the party had finished their reading. Thereupon the board was carried down three flights of stairs and into the patrol wagon. Francis, the manager, was arrested on a charge of disorderly conduct. "Our position is that only the telephone company was prohibited from removing the switchboard," said Schuettler.

The injunction was granted by Judge Brentano on representations made by "Ed" Morris, attorney for the poolroom gamblers, that the building in Larrabee street was used by "James Harding" for "conducting a legitimate cigar business."

Evidence that the board was being used for gambling purposes was obtained by Schuettler several weeks ago, when three members of the gambling detail, attired as telephone repair men, visited the place and confiscated a package of betting sheets. The telephone company will use this evidence in an attempt to have the injunction dissolved.

TELEPHONE TAXATION IN ILLINOIS.

MUNICIPAL corporations all through the Middle West are watching with interest the outcome of a law suit which is to determine whether the city of Elgin, Illinois, has the right to tax the Chicago Telephone Company one dollar per annum for each telephone in use in the city. Independent telephone companies will be especially interested in this suit.

The Chicago Telephone Company is a Bell concern having its headquarters in Chicago and operating in some thirteen counties. The company holds its grant in Elgin by virtue of an ordinance similar to that in effect in nearly every city where the company does business, and probably similar in substance to many franchises under which Independent telephone companies are operating. The litigation is therefore very important to corporations generally. Whatever the result the case will probably be carried to the supreme court for final decision.

An idea of the magnitude of this suit to this one corporation may be gained when it is known that the concern now has in operation about 125,000 telephones in Illinois. If Elgin succeeds in imposing an annual tax of one dollar a telephone the other municipalities in which the company operates will follow suit in all probability, and a considerable decrease in the company's earning power may be expected.

The thousand dollars or more which would have to be paid into the treasury of Elgin each year is a comparatively small matter. The real question at issue is the power of a municipality to tax a telephone company in this manner.

The attorney who has had direct charge of drawing the papers in the case believes that the fight will be upon the grounds that the council attempted class legislation in trying to tax the company. He expects that the case will be carried to the supreme court on legal questions.

The company's franchise in Elgin was passed in 1881. The wording, in so far as it relates to this case, may be of interest to readers of the AMERICA TELEPHONE JOURNAL everywhere:

. . . "The Chicago Telephone Company is hereby authorized to erect telephone poles in the streets of the city of Elgin and maintain a line or lines of telephone in connection with the same.

"All procedings of said telephone company and of the privileges acquired under this ordinance shall be subject to any ordinance relating to the same which may hereafter be passed by the city council of the city of Elgin."

This ordinance was accepted by the telephone company in a letter written to the city officials. Last spring the council, acting under the last paragraph in the ordinance quoted, passed a further ordinance wherein the company was taxed one dollar per instrument then in use in the city.

This Bell concern has a powerful rival in Kane, Will and some of the other Illinois counties which the Bell has always considered as its exclusive territory. This rival is the Interstate Telephone and Telegraph Company, which already has a long-distance line across the State in several directions. This Independent company in order to secure an otherwise favorable franchise in the thriving cities of Aurora, Elgin and Joliet, Illinois, agreed to pay into the respective city treasuries the sum of one dollar a year for each telephone in use during a limited number of years. This has not been a great hardship for the Interstate company, and it has kept the city councils in great humor because of the revenue derived from the concessions. These Independent franchises undoubtedly gave the Elgin people the idea of charging the Bell concern a similar sum of $1 a year per telephone. The Aurora Council tried the same thing in a different way two years ago. There the Chicago Telephone Company was being distanced by its young and vigorous Independent rival, partly because of the fact that the latter's wires in the business district were all under ground, while the Bell wires were on poles. The Bell people finally asked permission to lay an underground conduit and, while this was a consummation devoutly wished by all, the council tried to use the concession as a club with which to secure $1 a year per telephone. The attempt failed.

AN IMPORTANT QUESTION.

Independents have no love for Bell companies anywhere, but because of the principle involved will hope that the company may win this suit and settle the question for all time, as the fact that a city cannot exact rental for a legitimate use of its streets was settled. Unless the Elgin franchise has expired entirely and the company has absolutely no rights under it, it is difficult to see how the council can impose further burdens at this stage of operations.

There seems to be a growing disposition among cities to exact some compensation for the use of their streets by quasi-public corporations. Sometimes this takes the form of free telephones in the various city offices; sometimes of a specified annual sum per telephone, as in the cases cited. Peoria, Illinois, has granted an Independent company a franchise which requires the payment of a lump sum of $1,000 a year. Springfield, the Illinois State capital, imposed no burden upon the Independent company, except free telephones, in a franchise granted one year ago; but now is seeking to collect a pole tax of $1 a pole annually. Naturally the company is resisting this, as the aggregate tax would amount to several thousand dollars a year. This case, too, is liable to go to the Supreme Court for settlement.

This is a question which must be faced by telephone companies seeking franchises. More and more is the telephone franchise becoming purely a business proposition and, wherever Independent telephony has obtained foothold, in opposition to Bell monopoly, telephone operation has become entirely a business proposition. There are still virgin fields in this great country where the hand of the telephone man "never set foot," but these are rapidly disappearing before the onward march of progress. If a telephone company wishes to continue in popular favor, without which there can be no permanent success, it must deserve that favor; it must deliver "the goods."

Herein lies the secret of the success of Independent telephony. Independent companies are managed by local people who understand local conditions, are identified with the locality and know the people and their needs better than anyone else possibly can know them. They are free to buy their equipment in whatever market they can get the most for their money, and, profiting by the experience and shortcomings of their Bell rivals, they seem to have started in with the determination of succeeding by deserving to succeed.

The Telephone in the Courts

Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

TRIMMING TREES IN KANSAS.

Two years ago we built a telephone line on one of the streets in the city of Marysville, Kansas. The trees have now grown up into the wires; we want to string two more wires on this line, and cannot do so without climbing some of the trees. The property owner has forbidden us climbing the trees or trimming them. The trees stand just on the outside of the sidewalk. Kindly advise us in regard to this, and oblige.

M. T. C.

IN answering your question we will assume that you have received proper legislative and municipal authority to construct your lines in the streets. You thereby acquired power to do and perform all acts which are necessary to effect the purposes intended. The rule is that where it is necessary, in the construction or maintenance of a telephone company's lines, to cut or trim trees planted in or by the sidewalk, the company may, in the absence of a statutory provision prohibiting such act, cut or trim such trees so far as is reasonably necessary, but will be liable to an abutting owner in damages for any unreasonable and unnnecessary cutting. Joyce on Electric Law, Sect. 395.

TAXATION OF TELEPHONE POLES

Please send or publish in next issue the law upon the taxation of tele phone poles running through small tawns and villages, and oblige.

Dr. R. B., Sandy Spring, Md.

THE taxation of telephone poles must be considered, first, as connected with the question of interstate commerce, and, secondly, irrespective of such question.

Where the power to regulate the use of streets is granted to a village by legislative enactment, long-continued usage and constant adjudications of the courts, such municipal corporation may impose a reasonable license fee for the privilege of erecting telephone poles in its streets, lanes, and alleys; but, municipal legislation should not impose such unjust and unreasonable conditions as would evidence a purpose to harass, impede, or prevent interstate commerce. Certain ordinances of the city of Philadelphia provide that no telegraph pole should be erected in the city, except upon a payment of a license fee of $5 per pole, that there should also be paid a yearly charge of $1 per pole.

It was urged against the collection of said fees that the charge could not be maintained as a tax, because it was not within the power of taxation delegated to the city; that the charges were unreasonable as license fees and operated in substance as a tax, and that the ordinances were therefore void. The court held the fee reasonable and collectible as a police regulation, and that the charge was not a tax on business or on property, nor an interference with interstate commerce, and that the fee could be imposed. But such ordinances, imposing a yearly charge excessive to at least one-fourth the amount, and a total charge exceeding the cost of maintenance were subsequently held unreasonable and invalid. Much depends upon the nature and character of the business licensed, the extent of the privileges enjoyed and burdens borne, and of the expense, necessities, and indebtedness of the local government imposing the tax.

The use of the streets of a populous city would justify in a greater degree the exercise of the police power in this respect than would the use of streets in small towns where every conceivable use to which the public streets may be put is not exacted, but the demands of commerce and traffic are few. Fifty cents an electric light pole was held an unreasonable license fee where the cost of inspection was but 5 cents a pole; but for the city of Baltimore $2 per year per pole was held not an unreasonable license fee. It was held in Pennsylvania that a fee of $1 per wooden pole was not unreasonable. Joyce on Elec. Law, Sec. 99-100 and cases.

In two recent cases the Supreme Court of the United States held a license fee of $1 per pole to be unreasonable where the taxes were imposed by boroughs in which the company had no office and transacted no business, the boroughs being sparsely populated coal-mining communities, the buildings consisting chiefly of miners' cabins, and the poles located on the side of a highway which was little traveled. Postal Telegraph Cable Co. vs. Borough of New Hope, Adv. Op. (L. Ed.) No. 5, pg. 205. Ditto vs. Borough of Taylor, Id., pg. 208.

Irrespective of the question of interstate commerce, the question of how the poles of telephone companies are taxable depends entirely upon State statutes, their construction, and the enumeration therein of classes of property to be taxed. As a general rule the poles of telephone companies are held to be real estate and assessed as such. This is the rule in Tennessee and New York as well as in England. Western Union Telegraph Co. vs. State, 9 Baxt. (Tenn.), 509., 40 Amer. Rep., 99; 1 Amer. Elec. Cases, 326; People vs. Tierney, 126 N. Y., 166; 27 N. E., 269; 3 Amer. Elec. Cases, 40.

DISTRIBUTING BUREAU WINS.

JUSTICE WHITE, in the Supreme Court, in Brooklyn, N. Y., has granted a peremptory writ of mandamus directing the New York Telephone Company to restore its service to the New York and New Jersey Distributing and Circulating Company. This is the news distributing bureau which was raided as a poolroom exchange by the police last May, under instructions from Police Commissioner McAdoo.

After the writ of mandamus had been granted, an order was entered by Justice White directing the New York Telephone Company forthwith to "render telephone service to the applicant under all existing contracts between the telephone company and the applicant and to and from each of its telephones, with all public and private telephones, telephone stations, and subscribers upon the lines of the telephone or any of its allied or connecting lines."

In presenting the motion for the issuance of a writ of mandamus, counsel for the Distributing Company said that the company's business was "furnishing, distributing, and circulating, by telephone, news and information consisting of stock quotations, the result of baseball games, horse races, athletic contests, and sporting matters generally." During the last four years, he said that the concern had paid to the telephone company the sum of $48,000. As the telephone company was a common carrier, he argued that it must furnish service to anyone willing to pay for it.

Counsel for the telephone company, appeared to reply with a bundle of affidavits and police reports more than twelve inches thick, and Justice White asked him: "Do you expect to read all those to me this morning?" It was explained that most of the reports and affidavits were alike, and that it would be only necessary to read one. The affidavits consisted of one from the first vice-president of the telephone company, and three by police captains. These affidavits declared "on information and belief" that poolrooms within the precincts commanded by these captains were supplied with information by the Distributing Company.

"Let me see," interjected Justice White, "am I to refuse to grant this mandamus on the information and belief of a police captain? I think I have heard enough of this to have my mind made up; take your mandamus."

The Distributing Company's road to victory was not an easy one. On July 25th an application for a mandamus directing the telephone company to restore the service to the New York & New Jersey Company was made before Justice Scott, sitting in the Supreme Court. Justice Scott reserved his decision, but expressed the opinion very strongly at the time that no mandamus should issue, as the plaintiff company, known about town as the "Racing Syndicate," had a damage suit pending against the telephone company for breach of contract.

IN THE OPERATING FIELD.

INTERSTATE CONVENTION TO BE HELD AT CHICAGO.

AT a meeting of the executive committee of the Interstate Independent Telephone Association of the United States, held on Monday, August 29, it was decided to hold the annual convention at Chicago on December 13, 14, 15.

OUTING OF CENTURY EMPLOYEES.

THE employees of the factory department of the Century Telephone Construction Company recently held their annual outing, going by tally-ho to Gardinville Park, N. Y., at which place they spent an enjoyable day. During the morning a baseball game was played between the machinists and assemblers, which, after fifteen spirited innings, was decided in favor of the machinists. The afternoon was pleasantly spent with athletic contests and races which greatly added to the general amusement of all present.

Mr. B. L. Moore, manager of the company, and Mr. W. W. Kidney, chief engineer and superintendent, officiated. The outing was much appreciated by the employees, especially as it was given during the height of the company's busiest season.

C. J. FIELD'S BID NOT ACCEPTED BY BALTIMORE.

C. J. FIELD, of New York, one of the bidders on the contract to supply the city with conduit material, was recently adjudged by the Municipal Electoral Commission an irresponsible bidder, and his bids, made through a local firm, were thrown out. An allegation by inference was made that Mr. Field submitted a sample of nine-duct terra cotta pipe, manufactured by a firm with which he had no connection, and then hid it. He was the lowest bidder on that particular kind of material, but when the alleged trick was exposed by Mr. Charles E. Phelps, Jr., Chief engineer of the Subway Department, the commission voted unanimously to throw out all his bids.

The conduit specifications called for samples to be delivered to Engineer Phelps for testing not later than five days before the date set for opening the bids. Mr. Field's nine-duct sample did not arrive until after the bids were opened. This brought a protest from the Standard Underground Conduit Company of New Jersey, through Mr. Thomas Ireland Elliott, who charged that the bidder was irregular and irresponsible. The commission sat yesterday to hear the protest, the hearing of which ended very abruptly after Mr. Phelps' expose.

The subway engineer said that when the sample in question reached his office he noticed its close resemblance to another sample made elsewhere. He placed Mr. Field's sample on top of the other, and arranged to have a representative of the firm which sent the first sample come and see if he could pick his out.

Mr. Phelps then went to lunch, leaving Mr. Field in his outer office. When he returned the latter's sample was nowhere to be seen. An investigation led to its being found at the bottom of a pile of old samples in a corner of the room. Mr. Phelps concluded his statement by saying that he would charge no one in particular with having concealed Mr. Field's sample, but left it to the judgment of the commission.

"That is enough for me," said Mayor Timanus. "There has been some irregularity. Mr. Elliott, you will not have to protest. The bids you object to will be thrown out. The bidder is not one for this city to deal with."

The other members of the commission—City Register Hooper and President Gail of the Fire Board—agreed with the Mayor, and Mr. Field's bids were rejected. The protest of the Standard Underground Conduit Company was in effect that Mr. Field, in submitting his samples, named nine factories at which they were manufactured. Two or three of these factories, it was alleged, do not make conduit material, others are not now in operation, one is for sale, and another is owned by one of the competitive bidders. The company added that Mr. Field could not supply certain varieties of the material if he were given the contracts.—*Baltimore Herald.*

STARK COUNTY TELEPHONE EXCHANGE DAMAGED BY FIRE.

THE exchange of the Stark County Telephone Company, at Alliance, O., was recently damaged by fire for the second time within two weeks. A cross between a cable line and a trolley wire of the Street Railway Company was the cause of a large part of the switchboard and drops being burned out.

At the time of the accident some linemen were at work on the poles to which the cable was fastened, but fortunately did not have hold of it in such a manner as to cause them any injury. The fire department was summoned, but before they reached the exchange the fire had been put out. It is estimated that the loss sustained will be nearly as great as the previous one, which caused about $2,000 worth of damage.

BRANCH EXCHANGES OF HOME COMPANY OF KANSAS CITY.

THE Kansas City, Mo., *Journal* has closed a contract with the Home Telephone Company to install one of its private branch exchanges. This step was only undertaken after a thorough consideration of the merits of the Bell and Independent companies' systems. One of the most important points in favor of the Independent system is that there are no party lines; another is the up-to-date character of the branch exchanges, which have all the latest improvements to facilitate speed and accuracy in operation. The Home Company has about thirty-five other private branch exchanges in operation at the present time and contracts for several more to be installed as soon as they can be secured.

THE LIMA TELEPHONE AND TELEGRAPH CO.

THE exchange of the Lima Telephone and Telegraph Company was opened for business in August, 1895, with 275 telephones connected, this being more telephones than there were in Lima before the advent of the home company. The reasonable prices and high quality of service rendered have served to increase the list of subscribers to 2,000. The company has, in the meantime, installed the first and only underground system of wires in the city, and has also installed the latest type of lamp signal, multiple switchboard. The line plant is of the highest grade copper metallic construction.

The policy of the company has been to provide the city with the best to be had in the art of telephones, and that its efforts have been appreciated is certainly shown by the magnificent growth of business.

The company occupies the entire third floor of the Harper Block and in connection with the United States Long-Distance Telephone Company, affords its patrons a very superior long-distance service. This being especially true in regard to service to a large number of cities, towns and villages in this part of the State having Independent exchanges only.

It is now furnishing service to about 200 rural subscribers in

Digitized by Google

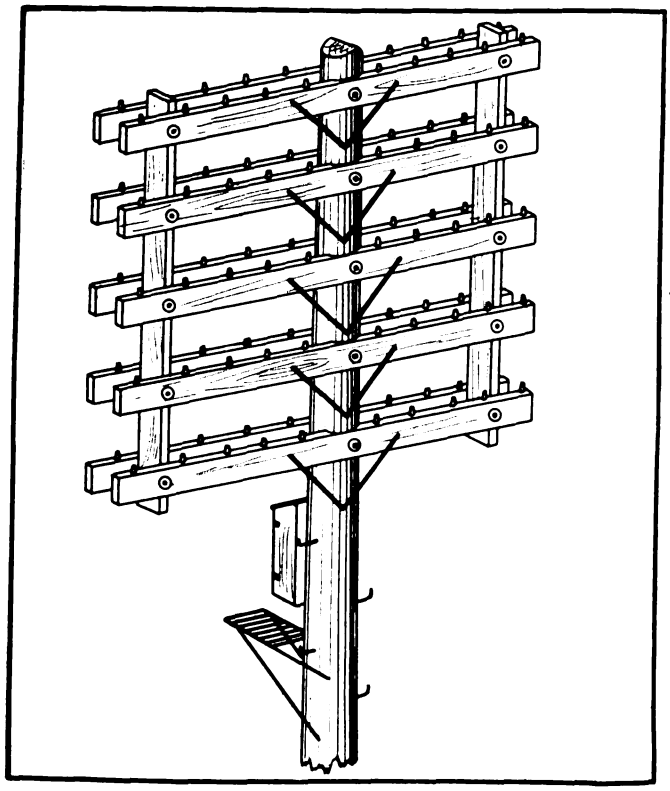
the vicinity of Lima, thus affording communication between the country and city subscribers without charge other than the regular rental.

The officers of the company are D. J. Cable, president; W. H. Duffield, treasurer; C. H. Cory, C. F. Stolzenbach, J. R. Sinclair, George W. Beers, J. B. and A. W. Hoge and Gustave Hirsch, directors, and George H. Metheany, secretary and general manager.

HINTS FOR CARE OF CABLE POLES.

By C. E. Nicholas.

CABLE poles require and should have as much attention as the central office equipment. All linemen should be instructed to use the greatest care while working on them and never to use spurs unless pole steps are not provided. These steps will more than pay for themselves in the prolonged life of the pole. All cable poles should be double cross-armed to increase their strength, but even this does not prevent the arm becoming loose



and twisting about by the linemen climbing on them. In order to overcome this difficulty a good idea is to omit the spreader bolts and wood blocks between the ends of the arms and to place instead a piece of 2-inch plank, as shown in the illustration, cut to fit from above the top arm to a little below the bottom one. Then bolt the arms together through the strips. This will add to the strength as the strain on any arm will be distributed to all the others, and a man standing on any arm will not get it out of position.

INDEPENDENT COMPANY FOR SAN DIEGO, CAL.

THE Home Telephone & Telegraph Company, of San Diego, Cal., is placing on sale $100,000 of its first mortgage 5 per cent. thirty-six year gold bonds, on basis of $1,000 bonds and $1,000 stock for $925, of which 25 per cent. is to be paid down and the balance not exceeding 15 per cent. monthly with accrued interest. The bonds are dated July 15, 1904, and are due thirty years hence, subject to call after 1914 at 105 and interest. A sinking fund is to be established after 1909, consisting of 10 per cent. of the net earnings. The officers of the company are: President, Charles E. Sumner; secretary and treasurer, William Godfrey. A prospectus issued regarding the prospects of the company is in part as follows:

The plant under consideration will be one of the best systems installed in this country, with conduit lines and switchboard capacity of 5,000 (metallic circuit) telephones and equipped with the new automatic switchboard and telephone system. The company was incorporated in California with $500,000 capital stock, and will commence operations with some 1,500 telephones installed. It is now erecting a three-story building for its own use in the midst of and close to the leading hotels, banks and business houses in San Diego, has laid its underground conduits, and is now setting poles as part of its work of installation. The entire telephone plant and exchange, it is agreed by contract with the Empire Electric Company of Toledo, Ohio, shall be completed and delivered on or before January 1, 1905, but it is expected will be in operation before that time.

The bonds and stock are to be issued from time to time as construction progresses, to the extent of $350,000 each of bonds and stock on the plant and installation of 1,500 telephones, the balance to be only for extension and enlargement as required. "It is expected that the number of installations will exceed 2,000, on which basis the net profits of the system will be capable of producing a 4 per cent. dividend on the capital stock and interest on the bonds, leaving a surplus in addition sufficient to provide a sinking fund to cancel the bonded indebtedness when due." The following estimate is furnished: 800 business telephones at $48 per annum, $38,400; 1,200 residence telephones at $24 per annum.

THE STANDARD VITRIFIED CONDUIT TO GO OUT OF THE RECEIVER'S HANDS.

THE numerous friends of the Standard Vitrified Conduit Company will be pleased to hear that it will go out of the hands of the receivers on September 10. This receivership was not on account of any financial difficulty but was due to internal troubles. The company is in a first-class condition in every way and has continued to carry on a rapidly growing business. At present it has on hand some very large contracts for conduit material and is working its factory full time to keep up with the increasing demand for its material.

INDEPENDENT SYSTEM FOR ONTARIO.

DETROIT capitalists have organized a telephone company with an authorized capital of $100,000, and have obtained a charter to do business in the province of Ontario, Canada. They are empowered to carry on the general business of a telephone company, with various restrictions as to the erection of poles and wires, which guard the rights of private and municipal property.

The incorporators are the following: C. W. Taylor, capitalist; R. Brooks, real estate agent; J. A. McRae, grocer; P. T. Chestey, contractor; A. D. Prosser, attorney, all of the City of Detroit. The company proposes to begin its Ontario operations in the County of Essex.

TRI-STATE LETS CONTRACT FOR EXCHANGE AT GRAND FORKS, N. D.

THE contract for the exchange building of the Tri-State Telephone Company at Grand Forks, N. D., has been awarded to Dinnie Brothers.

The building will be thirty-four by fifty feet in size, one story high on high basement, and will be modern in every particular, the plans calling for astructure adapted in every way to the telephone business. It will have a pressed brick front, with stone trimmings, and will cost in the neighborhood of $8,000. Work on the new building will begin at once.

INDEPENDENT TELEPHONES IN CHICAGO.

THE Illinois Tunnel Company is said to have now in service more than 8,000 trunk line telephones. The Chicago Telephone Company has more than 14,000 telephones in the business district, but of this number only a small percentage is trunk line service. The Illinois Company is just beginning to put out extensions and President Wheeler predicts there will be 25,000 instruments in service within twelve months.

TELEPHONE PATENTS

PARTY LINE RINGING KEY.

J. W. Lattig, of West Bethlehem, and C. L. Goodrum, of Philadelphia, patent (No. 767,573) and assign to the Eastern Telephone Manufacturing Company, of West Chester, a party line ringing key. This invention relates to party line ringing keys whereby it is impractical for the operator to make errors or mistakes in signaling substations. The accompanying diagram gives the circuit concentrically most easily understood by reference to the cord circuit in Fig 2. The inventor provides a

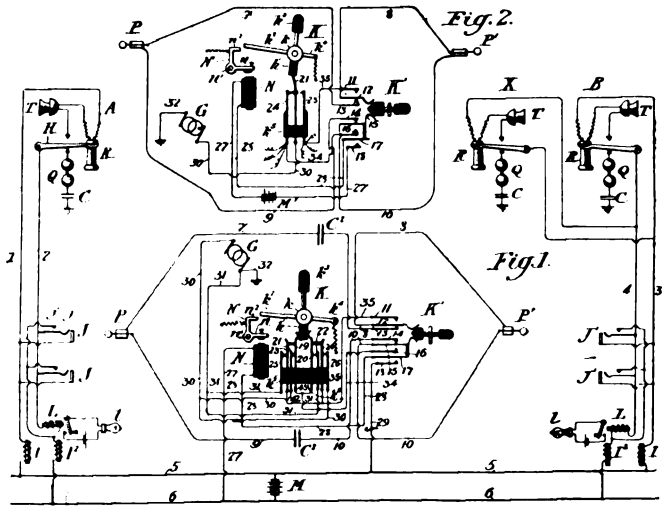

Fig. 2.

Fig. 1.

ringing key, K', and a master-key, K. By means of this master-key, ringing current may be delivered to the ringing key, K', in such a manner as to be sent either on one side or the other side of the line at pleasure. The handle of the key, K, is controlled by a detent, n^2, which is operated by an electromagnet, N. It is evident that whenever the key, K', is pressed the electromagnet, N, will be excited and the key, K, locked. Thus, the operator cannot move the master-key unless all the ringing keys are in the open position.

TELEPHONE EXCHANGE SYSTEM.

Isidor Kitsee, Philadelphia, Pa., patents (No. 766,450) an improved telephone exchange system. This patent is in line with a number of other patents recently issued to Mr. Isidor Kitsee which have been noticed in our columns, the object of all of them being to provide an improved form of switchboard. The present patent is an exceedingly complicated one, requiring a longer explanation than can be afforded in these columns, so that the reader who is interested is recommended to secure a copy of the patent. Briefly, Mr. Kitsee extends telephone lines through a series of plates placed in a shelf or desk before which the operator sits. A number of plugs are provided which carry an incandescent lamp and an electromagnet in the interior thereof. Connection is made by fitting these plugs into holes which are drilled through the plates and thus connecting one line to another. The electromagnetic mechanism in the interior of the plug operates as a signal to inform the operator as to whether parties are calling or desire a disconnection.

MULTIPLEX TELEPHONY.

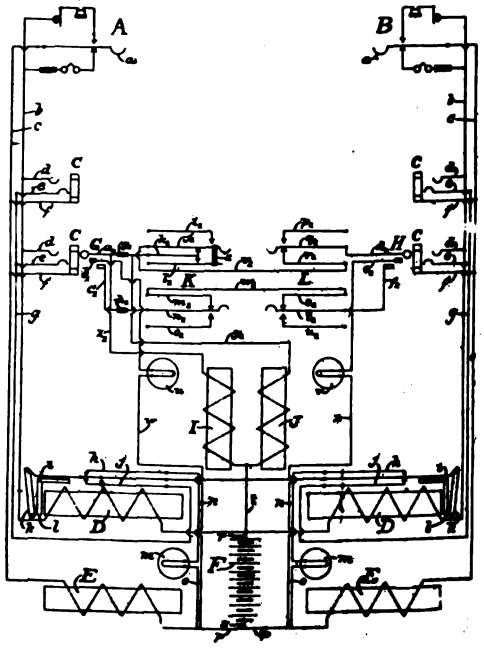
W. M. Miner, of Plainfield, N. J., patents (No. 745,734) an improvement in multiplex telephony. This patent relates to an improvement in multiplex telephony which was recently the subject of another patent granted to the same inventor and which has been noticed in these columns. This system is particularly applicable to the case of long toll lines where there are a number of telephones at each end, that desire to communicate with each other over a considerable distance. Each of the local lines, containing its respective transmitter and receiver, is attached to one segment of a revolving commutator, while the main line is connected to the center of the commutator. As the commutator is revolved each local line is put into communication with the main line for a very small interval of time. In the present patent the inventor describes the result of his experience, which indicates that the commutator must be revolved with such rapidity as to close the circuit between the main line and the local line, with a frequency as great as that of the sound waves in the vowel sounds and over-tones of articulate speech.

TELEPHONIC TRANSMISSION

Isidor Kitsee, of Philadelphia, Pa., patents (No. 766,451) an improved transmission system. The intention of this invention is to improve transmission over telephone lines. The inventor states that according to his experiments he has found that the introduction of condensers in series with a telephone line coupled with induction coils across the line improve its transmission. He does not, however, specify the electrical properties either of the condensers or inductance coils, which he has found preferable for the purpose.

TELEPHONE SYSTEM.

F. B. Parker, Chicago, Ill., patents (No. 767,953) a telephone system. The object of this invention is to provide a common battery circuit in which only one relay is used to operate both the line and supervisory signals. The circuit is shown in the diagram. Relay D is provided with two armatures. When both armatures are attracted the circuit of the line signal is closed. When neither is attracted, the circuit of the supervisory signal



is closed, and when only one armature is attracted neither is closed. It is evidently the intention of the inventor to simplify and cheapen the switchboard circuits but as a retardation coil is employed in both the line and supervisory circuits, it seems that but little improvement has been made in this direction. The inventor specifies that a suitable busy test arrangement shall be used, but inasmuch as one pole of battery is always connected to the ring of the jack, C, and the other pole to the tip of the plug it is difficult to see what would constitute a suitable busy test arrangement.

QUERIES

Questions on any subject relating to telephony will be answered on this page.

CUT-IN JACKS FOR TOLL LINES.—(416.)

Can you give me a circuit for cut in Jacks. I want to bring a toll line to a new station so that the line can be used both ways at the same time.
G. R. L.

The method generally employed is shown in Fig. 416, where *A*, *B* and *C* are three jacks with break contacts, as shown. The trunk from *N* terminates at the outside springs of jack *A* and the trunk from *S* at outside springs of *C*. The inside springs of *A* and *C* are joined together, and the outside springs of *B* are bridged across, while the inside springs connect with the drop or bell *D*.

In operation, if party at *N* wished to call *C* they could do so, al-

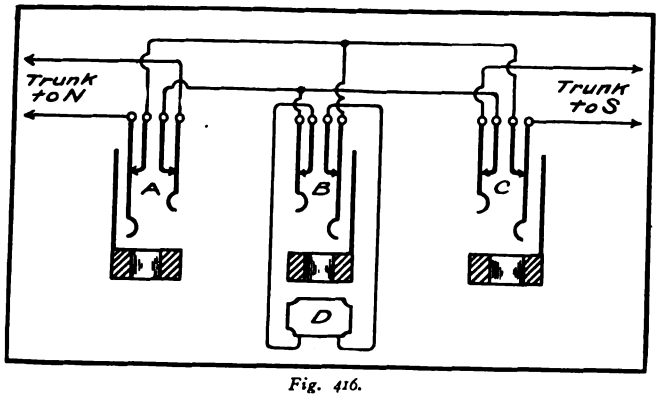

Fig. 416.

though it would be necessary to have some predetermined signal so that *D* would know when they were wanted. Should *D* wish to call *N*, they would insert the plug in the *A* jack, which would cut off the rest of the trunk. Now, if *S* called in the meantime the signal would be received by *D*, who would then plug into *C* and find out what was wanted. *B* is simply a listening jack, and is used when *D* wishes to find out if the line is in use or not, or for testing purposes. It is for the latter reason that the drop is cut out when the plug is inserted in the jack.

CROSS TALK ON GROUNDED LINES.—(417.)

We have several grounded circuits converging at a point about five miles from our switchboard and running thence parallel to the switchboard. Could we overcome the cross talk by running these circuits metallic to the point of divergence and there grounding the return wires, or woulud it be better to terminate the metallic part of the circuits in repeating coils and join on the grounded parts of the circuits through these coils. P. O. S.

The causes of cross talk are often so obscure that it is almost impossible to prescribe an effective remedy. In a general way it is probable that running the circuits metallic the way you sug-

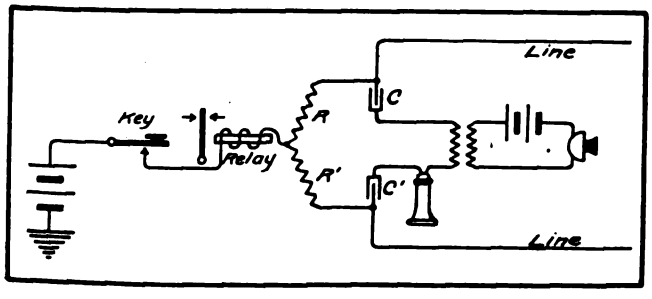

Fig. 419a.

gest will improve matters, though it is impossible to predict that it will cure the cross talk entirely. It is very likely the repeating coil will be an improvement. We would suggest that you try the experiment upon one or two lines and see what results. You can by this means ascertain whether the amount of improvement is sufficient to meet the requirements. The best method is to make all the circuits completely metallic and adequately transpose them. By this means you will undoubtedly obtain entirely satisfactory results.

LOW RESISTANCE DROP.—(418.)

I have a subscriber on a grounded line three-quarters of a mile long. His instrument is a bridging one, 1,600 ohm ringer and heavy fire bar generator. The switchboard drop is 500 ohms. Central can call the party but he cannot throw drop. I put in a 1,600 ohm extension bell at the exchange and find the party is able to ring it. Will you please explain why? O. A. F.

The 1,600-ohm extension bell being wound with fine wire to a high resistance has a great many more ampere turns than the 500-ohm drop, consequently the bell will ring with less current than is required of it through the drop.

RAILROAD COMPOSITE CIRCUIT.—(419.)

Kindly give me a diagram of the composite circuit used by railroads, and oblige. F. H. T.

The diagrams shown in Figs. 419a and 419b are sketches of composite circuits which have been successfully used by the Chicago, Burlington & Quincy; the Illinois Central; Pennsylvania; New York, New Haven & Hartford; Delaware, Lackawanna & Western, and the Lehigh Valley Railroads.

In some cases railways have gone so far as to extend telephone lines from their private exchanges through the signal towers, thus enabling a train to quickly communicate with the despatcher.

The circuits described have often been known as "railway com-

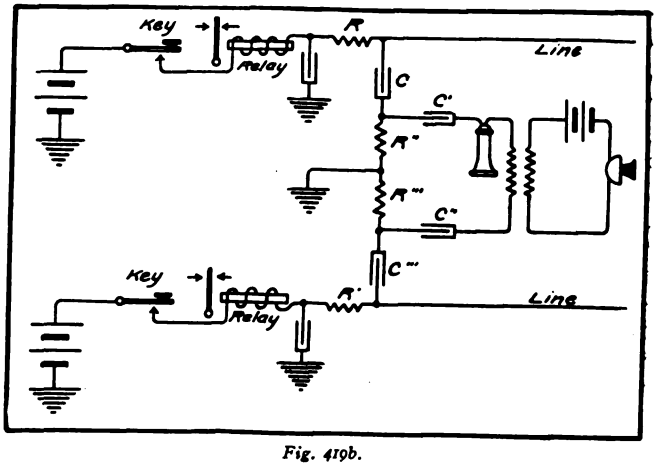

Fig. 419b.

posite circuits." There is a limit to the length of circuit and the number of intermediate offices which can be employed with satisfactory results, and also the impedance coils and condensers must be designed for each case specifically, in order to obtain the best service.

In Fig. 419b each side of the line is worked as a separate telegraph circuit with a grounded return, while both sides of the line are used for telephoning metallically.

In the figure the two sides of the line are shown equipped with keys and relays. *R* and *R'* are adjustable ohmic resistances used to balance the line. *C* and *C''* are condensers placed to prevent the flow of the telegraphic current. *R''* and *R'''* are ohmic resistances which prevent the talking currents flowing to ground or short-circuiting the receiver circuit. *C'* and *C''* are condensers which are intended to help the listening qualities of the line.

Fig. 419a shows a composite circuit designed so that there is one telegraph circuit using both sides of the line for one conductor with a ground return, while the telephone is entirely metallic.

THE WEEK'S MESSAGES

FINANCIAL.

GENEVA, IND.—The Geneva Telephone Company has increased its capital stock $2,000 for the purpose of making extensions and installing modern equipments. A. G. Briggs, president, and H. M. Aspy, secretary.

GALENA, KANS.—The capital stock of the Galena Telephone Company is $100,000 instead of $10,000, as erroneously stated in a recent issue.

BURLINGTON, WIS.—The Burlington, Rochester and Kansasville Telephone Company has increased its capital stock from $5,000 to $10,000.

FRANCHISES.

BRANTFORD, ONT., CANADA—The Independent Telephone Company, of Chicago, Ill., has asked the city council for a franchise to operate in this city. It has offered the city $200 a year in addition to granting the use of five free telephones.

OLD TOWN, ME.—The city council has granted a franchise to the Automatic Telephone Company to construct and operate a system in the town.

LAKE LINDEN, MICH.—The city council has approved the route for the proposed automatic telephone lines in this village.

OMAHA, NEB.—Lee Herdman will apply for a franchise to operate an Independent system in this city.

KENSAL, N. D.—The Kensal Telephone Company has been granted a franchise by the commissioners of Foster County. The company will extend a line to Carrington.

ASBURY PARK, N. J.—E. H. Snedeker, of the Monmouth Telephone Company, of Monmouth, N. J., has secured a franchise to construct and operate a telephone system in Asbury Park, N. J.

EL PASO, TEX.—R. A. Wooldridge and Charles F. Wren, by their attorney, Leigh Clark, have presented a petition to the city council asking for a franchise to construct and operate an Independent telephone system.

LYNCHBURG, VA.—The Lynchburg Telephone Company will ask the city council in September for a new thirty year franchise.

ELECTIONS.

SHELBYVILLE, ILL.—The Queen City and Shelby County Mutual Telephone Company has elected the following directors: Oscar Bennett, J. F. Ulmer and B. W. Kerr.

HENNIKER, N. H.—At a recent meeting of the Henniker Telephone Company the following officers were elected: George H. Sanborn, president; C. B. Childs, clerk; George H. Sanborn, Dana E. Huntington, W. O. Folsom, L. W. French and Elwin Bacon, directors.

KINGSTON, N. Y.—At a meeting of the stockholders of the Citizens' Standard Telephone Company the following officers were elected: Mortimer C. Drake, president; J. E. Klock, vice-president; Charles Reynolds, Jr., secretary and treasurer; William H. Short, manager.

SCHENECTADY, N. Y.—At a recent meeting of the stockholders of the Home Telephone Company, J. W. Smithley was chosen director in place of E. E. Williams, resigned. The business of the company is constantly increasing, and within the next two or three weeks long distance service will be established with Utica.

RALEIGH, N. C.—C. T. Dahl has been elected treasurer of the Home Telephone Company to succeed L. J. Olson, resigned.

COMBINATIONS.

POSEY, ILL.—George Johnpeter, of this place, has purchased the property of the Southern Union Telephone Company, of this county. The system connects the towns of New Baden, New Memphis, Trenton, Aviston, Breese, Germantown, Buxton, Posey, Hoffman, Huey, Clinton Switch, Keysport and Carlyle. The lines will be extended by the new management.

OSKALOOSA, KANS.—A. B. Clark, of this place, has purchased the Herrington Telephone Exchange. The exchange will probably be remodeled.

ALLEGAN, MICH.—The Citizens' Telephone Company, of Grand Rapids, has purchased the plant of the West Michigan Telephone Company, of this city, formerly operated by Major Cornwell and M. D. Owen. About 300 telephones are operated by this system. Two copper wires will be strung from Grand Rapids to connect with the local system at once.

LAKE WILSON, MINN.—George H. Woodgate, of Slayton, has purchased the T. F. Robinson telephone line, extending from this place to Cameron Township.

ITALY, TEX.—C. M. Mitchell has purchased the telephone exchange at this place from R. B. Lockhart for $5,500.

MORAN, TEX.—Dennis & Son have disposed of the Moran Telephone Exchange to N. H. McElroy.

PERSONAL.

C. H. BREWSTER, late manager of the Michigan State Telephone Company, at the Soo, has been appointed manager for the company at Grand Rapids.

T. S. DODSON has been appointed manager for the Cumberland Telephone and Telegraph Company's plant at Mt. Carmel, Ill.

E. W. HAMMER, president and treasurer of the General Engineering Company, has returned to Chicago for a few days. Mr. Hammer spends the greater portion of his time at Sioux City, in looking after the construction of the automatic exchange of the Sioux City Telephone Company, which is fast nearing completion.

FRANK B. COOK, the well-known manufacturer of protective apparatus and telephone accessories, is on an extended trip through the West, where he will endeavor to secure a well earned rest and recuperate from the rush of work incidental to the enormous business he has done this year. Mr. Cook will go to Denver, Los Angeles, San Francisco and other Coast points, and will probably return by the way of Salt Lake City, also spending some time in the Black Hills, looking into the progress of the telephone company which he owns there. At Salt Lake City he will spend a short time at the plant of the Utah Telephone Company, where he recently installed a main distributing frame equipped with his No. 44 protector. The frame has an ultimate capacity of 4,100 pairs.

NEW COMPANY NOTES.

WASHINGTON, D. C.—A certificate of incorporation of the Home Telephone Company, with a capital stock of $300,000, has been filed here. The incorporators are: George H. Carey, Eugene Schooley and J. Cohencion.

BICKNELL, IND.—The Citizens' Telephone Company, of Bicknell, has been incorporated with a capital stock of $10,000, by R. J. Pickel, J. T. Phillippe, Harmon Buck, J. L. Donellson, E. T. Cox, Charles Harting and W. J. Huff.

GALESBURG, ILL.—The Dahinda Farmers' Telephone Company, of Galesburg, has been incorporated with a capital stock of $1,400, by Samuel Sutherland, Charles Woolacy and J. M. Oberholzor.

KIRKLAND, ILL.—The Farmers Union Telephone Company, of Kirkland, has been incorporated with a capital stock of $2,500 by William Van Wert, John Paulson and W. N. Thompson.

QUINCY, ILL.—The Adams, Pike County & Hannibal Telephone Company has been incorporated with a capital stock of $7,000, by W. H. Breckenridge, John W. Buttz, S. S. Inman, Charles H. Rankin.

ST. JOSEPH, ILL.—The St. Joseph Telephone Company has been incorporated with a capital stock of $18,000. The incorporators are: N. C. Hoyt, U. G. Glasscock and O. C. Bigge.

URBANA, IND.—The Urbana Independent Telephone Company has filed articles of incorporation with the Secretary of State. The capital stock is $10,000. An exchange will be established in Urbana. The directors are: Emanuel Stover, Adam Cook, E. F. Baker and J. C. Schmolzried.

CENTERVILLE, IA.—The Appanoose County Telephone Company has been incorporated with a capital stock of $2,500. The company will build an exchange in this city under the franchise recently given to the Exline Telephone Company. The officers are: Newton Harris, president; A. B. Davison, secretary; Jesse M. Ellis, John A. Cutts, W. J. Jones, J. W. Rinehart, A. H. Baker and J. H. White, directors.

WASHINGTON, KANS.—The Washington Mutual Telephone Company was organized with the following officers and directors: John King, G. Wertman, J. E. Baker, D. A. Kramer, Ira Henry, O. G. Lobaugh.

CALLAWAY, KY.—The Callaway County Independent Telephone Company has been incorporated with a capital stock of $1,000.

MECHANICSVILLE, MD.—The Southern Maryland Telephone Company has been incorporated with a capital stock of $10,000, to operate exchanges in Mechanicsville, Charlotte Hall and Chaptico. The officers are: J. T. Coad, Charlotte Hall, president; L. J. Carter, Charlotte Hall, vice-president, and J. B. Ballinger, Mechanicsville, secretary and treasurer.

KINGMAN, ME.—The North Penobscot Telephone Company has been incorporated with a capital stock of $5,000, to operate systems in Kingman, Prentiss, Carroll, Springfield and Lakeville Plantation. The officers are: H. P. Osgood, of Kingman, president; William A. Blanchard, of Carroll, treasurer.

GRAND LEDGE, MICH.—Residents of Grand Ledge and vicinity are planning for the construction of a telephone system with a capital stock of $10,000.

ARTICHOKE LAKE, MINN.—The Farmers and Merchants' Rural Telephone Company has been incorporated with a capital stock of $10,000. Charles Honson is president; Edward Roberson, vice-president, and Dietrich Chmeckpeper, secretary.

MADISON, MINN.—The Farmers' Mutual Telephone Company, of Lac qui Parle County, has been incorporated with a capital stock of $200,000.

OSCAR, MINN.—The Oscar Telephone Company has been organized and has commenced building its line.

ARLINGTON, NEB.—The Arlington Telephone Company has been incorporated with a capital stock of $10,000, to construct lines in Douglas County.

JEFFERSON, N. H.—The Jefferson Telephone Company has been incorporated with a capital stock of $1,000.

FAIRHAVEN, N. Y.—The Sterling Telephone Company, of Fairhaven, has been incorporated with a capital stock of $960,000. The directors are: F. B. Phillips, Frank Longley and Herbert Grant, of Fairhaven.

NEW YORK, N. Y.—The Alaska Telephone and Telegraph Company, of New York, has been incorporated with a capital stock of $100,000. The directors are: S. E. Boyd, of Nome, Alaska; W. H. Duval, E. D. Church, J. H. Emanuel, Jr., P. V. R. Van Wyck, W. M. Lovering, A. C. Shenstone, W. H. Harding, Jr., H. B. Haigh and John Englis, of New York City.

STAMFORD, N. Y.—The Delaware and Schoharie Telephone Company has been incorporated with a capital stock of $2,000 by H. P. Hubbell, E. W. Landon and M. S. Wood, of Stanford; W. H. Decker, of South Gilboa, and F. P. Jones, R. H. Chaplin and George W. Shelmandine, of Ruth.

DRYDEN, OKLA.—The Dryden Telephone Company has been incorporated with a capital stock of $1,100 by J. S. Campbell, L. D. Perry, J. S. Wilkins, J. D. Le Mar and L. F. Shrewer.

BUTLER, PA.—The People's Telephone Company has been re-chartered with a capital stock of $50,000. The officers are as follows: John Younkins, president; Marion Henshaw, secretary; Thomas Shufflin, treasurer. These, together with John V. Ritts and Albert L. Rieber, constitute the board of directors.

HOLLANDALE, WIS.—The Ridgeway, Jonesville & Hollandale Telephone Company has been incorporated with a capital stock of $2,000. The incorporators are Robert Brunker, William Kramer and Thomas Conway.

LANCASTER, WIS.—The Hickory Grove Farmers' Mutual Telephone Company has been organized to construct a system in the town of Hickory Grove, and has filed articles of incorporation in the county clerk's office. The capital stock is $360, and the incorporators are Charles Kalish, Oaf Hoffland, Joseph Riley, Chris. Colvud and John Lindehier.

MISCELLANEOUS.

ST. JOHN, N. B., CANADA.—The St. John Telephone Company was damaged by fire to the extent of $1,500.

NEW ROCKFORD, N. DAKOTA.—The citizens in Freeborn and Mor-

Digitized by Google

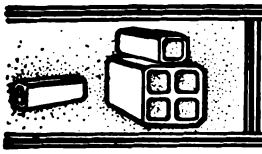
ris are considering the advisability of building a telephone line from this city out into their country.

CHILLICOTHE, OHIO.—Four hundred and fifty of the lines entering the telephone exchange were damaged by a recent electrical storm.

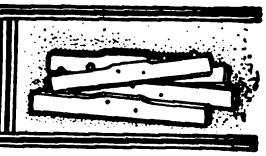
EL PASO, TEXAS.—An Independent telephone company, it is authoritatively announced, will be in operation by December 1st.

UNDERGROUND.

KNOXVILLE, TENN.—The People's Telephone Company has completed the underground work which it is to do for this season. It is the intention to extend the underground system as much or more each summer until all of the business section of the city has been covered and overhead wires and poles shall have been removed. The work of putting in the cables into the recently constructed underground conduits is now being done.



New Construction in the Field



GREENVILLE, ALA.—W. N. Cannon, proprietor of the Greenville Telephone Exchange, is preparing to install a complete new common battery system, entirely re-constructing his old exchange.

KINGMAM, ARIZ.—The Kingman, Nevada and California Telephone Company, which operates in Kingman Needles, and from Manvel to Searchlight, will construct telephone lines to all mining camps in the Nevada, Arizona and Southern California deserts.

DANVILLE, ILL.—The Vermilion County Telephone Company has received four miles of new cable to be used in re-building its system. A new switchboard is being installed.

WAVERLY, IOWA.—A rural telephone line is being constructed between here and Plainfield.

HILLSBORO, ILL.—The People's Mutual Telephone Company is making a large number of improvements and extensions to its system.

SHELBYVILLE, KY.—Representatives of the Home Telephone Company, which was recently granted a franchise, are here preparing plans for the construction of the system.

WASHINGTON, ME.—The Washington Telephone Company has decided to extend its lines to Whitneyville. Arrangements have been made to construct a branch line from Marshfield for about two miles.

LUDINGTON, MICH.—The Lake Shore Telephone Company's full force of pole setters and linemen are at work running a wire from Hesperia to White Cloud.

HERON LAKE, MINN.—The Minnesota Valley Telephone and Telegraph Company will construct an Independent telephone system here.

MEXICO, MEXICO.—The *Mexico Herald* states that Jose Sitzenstatter, of Mexico, instructor of Federal telephone operators in the use of telegraph printing machines, has obtained from the Mexican Government a concession for the installation of a new telephone system in Mexico City. It is stated that the firm of L. M. Ericsson, of Stockholm, Sweden, is one of the syndicates which will back the new concern.

BLUE SPRINGS, NEB.—Plans and specifications for the office building for the Independent Telephone Company have been made. Construction will commence in the near future.

CANASTOTA, N. Y.—Charles J. Wood, of Utica, N. Y., it is understood, has made a proposition to take charge of installing an Independent telephone exchange in Canastota. He is said to be willing to take stock in the exchange and to oversee its construction and operation.

HONEOYE FALLS, N. Y.—The Inter-ocean Telephone Company has just placed a new switchboard in its central office and later will put in a local exchange.

MARATHON, N. Y.—The Farmers' Telephone Company is to be erected from Marathon to Texas Valley.

MILFORD, N. Y.—A local telephone line is contemplated to connect this village to Oneonta.

SODUS, N. Y.—The Wayne-Monroe Telephone Company will extend its lines to cover Wayne and Monroe Counties as far west as Rochester. A line will be run through Ontario County and Cayuga County to Auburn, connecting with all intermediate points as far south as Geneva.

EDINBURG, N. D.—The Edinburg-Gordar Telephone Company will construct a local exchange.

PORTLAND, N. D.—The Red River Valley Telephone Company is building and extending a number of lines west of here.

THOMASVILLE, N. C.—Work has begun on rebuilding the system of the Thomasville Telephone Company at this place. New pole lines and new equipment throughout is to be installed.

BELLAIRE, OHIO.—The stockholders of the Ohio Valley Telephone Company have reorganized by electing W. T. Graham, of New York; J. B. Driggs, Hunter S. Armstrong, George Walters and Charles Rosser, as directors. Mr. Armstrong was elected president, and Mr. Rosser, vice-president, and William Steas, secretary and treasurer. Resolutions were passed providing for the entire reconstruction of the system to begin at once. Option has been taken on a building to serve as general offices. New switchboards will be installed, a new cable system put in, and new wires strung.

IRONTON, OHIO.—The Western Union Central Telephone Company is installing a central energy board here in place of the old transfer board, which has been outgrown.

WEST UNION, OHIO.—The Adams County Telephone Company will construct a line from West Union to Cherry Farm and Winchester.

ALTOONA, PA.—The Hunutingdon and Clearfield Telephone Company at present has a force of men at work extending its lines from Peale to Snowshoe. At the latter place the company will connect with the United Telephone Company's lines, and open up territory in central and eastern Pennsylvania. It is expected to have the new line in operation by the end of August.

BLANDON, PA.—The Pennsylvania Telephone Company is building a telephone line from Blandon to Half-Way House.

BENTLEYVILLE, PA.—The Bentleyville Telephone Company of Bentleyville, is contemplating extending its line into the Vanceville region.

CONNELLSVILLE, PA.—The Tri-State Telephone Company has begun the construction of a line 2½ miles long, from Dawson to Flatwoods.

DUCANNON, PA.—The Perry County Telephone Company has completed its system at New Bloomfield. The system reaches Elliottsburg, Green Park, Loylasville, Landisburg and Alinda.

FOREST CITY, PA.—The Northeastern Pennsylvania Telephone Company has decided to extend a line from Ararat to the Thompson and Gelat Road. Another line will probably be constructed from Winwood to Equimuk.

READING, PA.—The Consolidated Telephone Company has sixty-two men employed in making improvements in West Reading.

WASHINGTON, PA.—The Farmers' Mutual Telephone Company is building a line from this city to Wyland.

HILLSBORO, TEX.—The Hillsboro Telephone Company will install a central energy system within the next month.

LOCHHART, TEX.—The Commercial Telephone Company has arranged to install a telephone system in this city.

VICTORIA, TEX.—Right of way has been granted by the Commissioners' Court for a new telephone line between Victoria and Mission Valley. Citizens of this town will subscribe the necessary amount for the construction of the line.

LYNCHBURG, VA.—W. R. Doss, of Welsh, W. Va., has secured a contract with the Water Department of Lynchburg, to construct a telephone line twenty-five miles long as an auxiliary to the city water supply.

WEBB LAKE, WIS.—Arrangements are being made for the construction of a telephone line from this place to Spooner, to connect with the Swiss line.

LA CROSSE, WIS.—The Tri-State Telephone Company is extending its system from Winona to this city. The work is to be completed about September 1st.

PORTAGE, WIS.—Preliminary steps are being taken toward the establishing of another telephone exchange in this city with rates of $1.50 and $2.50 per month.

RACINE, WIS.—The Badger Telephone and Telegraph Company will construct a toll line from Racine to the Mississippi River, which has the signature of every farmer from Elkhorn to Racine, granting right-of-way to the new line.

BOOK NOTICES.

ELEMENTARY TELEGRAPHY AND TELEPHONY. By Arthur Crotch, Spon and Chamberlain, of New York and London. 223 pages. 238 illustrations. Price, $2.00.

This volume is the latest issue in the Finsbury Technical Manuals. The author states in the preface that the intention of the work is to cover the intermediate ground between electricity and magnetism and the practical applications of telephony and telegraphy. In a sense the volume realizes the claim made for it.

The first ninety-four pages are devoted entirely to elementary lessons in electricity, in which the simplest phenomena of the science are described. Telegraphy is then taken up, and the next eighty-six pages are devoted to an exposition of the various English telegraph systems. The double and single needle instruments are described at considerable length, as well as the various Wheatstone apparatus. Duplex telegraphy receives an extended exposition, and compared to the elementary simplicity in the descriptions of electric and magnetic phenomena the first ninety-four pages, this portion of the work appears to be unduly complex and to lack clearness.

Telephony is taken up in Chapter XVIII., and the entire subject compressed within twenty pages. There is a brief description of Sound Waves, the principle of the magneto receiver, and the Hughes microphone; thence follows a paragraph describing the microphone transmitter and a few cuts of English and German instruments. Considering that the telephone now outrivals the telegraph and embraces a far larger number of subscribers, handling many more messages, and absorbing a notable percentage of the capital invested in all electrical industries, the cursory treatment accorded it in this chapter, appears strange.

The last two chapters are brief expositions, devoted to the construction of telegraph lines and the methods of electrical testing.

As an elementary manual for the Manual Training School, giving a view of telegraphy from the English standpoint, the volume will have a place, but it is not likely to meet the desires or fulfil the expectations of American readers.

Digitized by Google

TRADE NOTES

THE S. H. COUCH COMPANY, of Boston, has issued a bulletin on Farmers Line Switchboards, and it will gladly mail a copy to anyone requesting same.

THE CHICAGO INSULATED WIRE COMPANY, of Chicago, keeps a complete stock of weather-proof, annunciator, and magnet wire, cables and galvanized strand at its St. Louis warehouse, and is in a position to make prompt shipment from that point.

THE BAIRD MANUFACTURING COMPANY, 4 Michigan street, Chicago, has designed a new nickle pre-payment coin machine for use on common-battery or magneto telephones. It has a number of striking new features and promises to meet with immediate success.

J. W. MIDDLETON & COMPANY, 167 Dearborn street, Chicago, are putting on the market a new line of postal scales. One in particular is very unique. It combines a postal scale, stamp drawer, pin drawer, ink stamp, and pen rack, all in one. It is made out of the best cold rolled steel and should last a lifetime.

THE KNICKERBOCKER CONSTRUCTION COMPANY, of 15 Cortlandt street, New York, have been awarded the contract for the installation of 5,000 feet of underground cable for the Buffalo, N. Y., Fire Department. The cable is being manufactured by the American Electrical Works, of Philipsdale, R. I., and 26 Cortlandt street, N. Y.

THE WESTERN TELEPHONE MANUFACTURING COMPANY, of Chicago, is complainant in a suit brought against the Williams-Abbott Company, of that city in the United States Circuit Court for an alleged infringement of a patent governing the manufacture of combined annunciators and spring jacks, used in connection with telephone switchboards. A permanent injunction is asked for by the plaintiff, compelling the defendant company to cease making and marketing the articles said to be covered by a patent held by the plaintiffs.

FRANK B. COOK, of 238 West Lake street, Chicago, has been kept busy trying to supply the demand for his type S. S. pole cable terminal, which has jumped into immediate favor. Among others, the Bureau County Telephone Company, with its main office at Princeton, Ill., has installed these terminals in six of its exchanges. These exchanges are located at Princeton, Sheffield, Spring Valley, Tiskilwa, La Moille and Walnut.

THE STERLING ELECTRIC COMPANY, Lafayette, Ind., reports a steadily increasing demand for its well known type of common-battery Bell type switchboards. It has recently installed telephone equipment for the following companies: Johnson City, Ill.; Sebewaing, Mich.; Cerro Gordo, Ill.; Portland, Ind.; Bloomington, Ind.; Winona, Minn.; Charleston, Ill.; Cheboygan, Mich.; Monmouth, Ill.; Shreveport, La.; Bay City, Mich.; Erie, Pa.

THE CALCULAGRAPH COMPANY OF AMERICA secured an opinion from Judge Hale on August 16, in the Circuit Court of the United States, District of Massachusetts, in its suit against John C. Wilson, doing business as the Automatic Time Stamp Company, for infringement of two patents numbered 424291 and 583320, owned by the Calculagraph Company, in the manufacture and sale by the defendant of the machine styled the "Timometer." The decision holds that the two patents in suit are valid and that claims of both have been infringed by the defendant in his machine. A decree is entered for the complainant for a permanent injunction, and for an accounting with costs.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY is at present building five complete common battery equipments, to be used in New York State. It has also under construction a number of other switchboards, including both common battery, magneto drop and battery call magneto switchboards for different exchanges in other States. The company has been exceptionally busy during the summer months and its business is rapidly increasing. One of the switchboards it is building is a 1,500 line multiple common battery lamp signal switchboard in a 3,600 line cabinet, is constructed on an entirely new principle, which will add greatly to the efficiency of an exchange and reduce the maintenance and amount of floor space required considerably, both of which mean an actual saving of money to exchanges using this equipment. The company will be pleased to send details regarding the above switchboard and its construction.

THE NATIONAL BATTERY COMPANY, of Buffalo and New York City, has recently made arrangements for the extensive enlargement of its factory, which has become necessary on account of the rapid growth of its business. The history of this factory is unique. It was originally put into the "Trust," known as the American Bicycle Company, which later became the Pope Manufacturing Company, and from them the entire capital stock has been purchased by individuals, who are, at the present time, so improving the interior arrangements that all the manufacturing methods and systems will be thoroughly up-to-date. Electric elevators, trolley car lines, etc., will equip the factory, carrying the heaviest product handled rapidly from place to place. The chemical and electrical laboratories have been greatly increased in size, and are being equipped with the very latest types in every variety of instruments required for experimental work. The spirit of the new ownership and management is bold and aggressive, having at its command all the capital and resources that will be required to make the company a success, and they are pushing on as rapidly as it is possible to go. The largest product of the factory is batteries for power plants and various kinds of stationary work. After this, the railroad and telephone batteries are the important product. There are only a very few manufacturers of electric storage batteries in this country (in fact, they number less than a half dozen), but of the number, the National Battery Company is one of the most active. This company will always be most willing to answer all communications in respect to its product.

WANTED

Advertisements under this head, 25 cents for 25 words or less for each insertion. Prepaid.

YOUR TOLL TICKETS!
HERE'S WHERE YOU GET THEM RIGHT!
12—GOOD FORMS TO CHOOSE FROM—12

FOR A DOLLAR BILL we will send you as a trial order, 1,500 of our No. 9 Tickets by return mail. All Tickets padded and transportation prepaid. 5M Large Size, $2.50. 5M Small Size, $2.25. Lots of 5M, 10M, 25M, or 50M. Write for our new catalogue, which gives samples and particulars. We also make Monthly Toll Bills, Trouble Tickets, and Artistic Office Stationery. Endorsed by AMERICAN TELEPHONE JOURNAL.
GILDART BROS., Albion, Mich. 168

WANTED—Second-hand generators and ringers in good condition; give make, general condition and price asked. Address Box 223, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 223

WANTED—Position by telephone engineer, capable of taking charge of plant and giving good service to subscribers and dividends to stockholders. Address, F. C. Woods, 665 Wells street, Chicago, Ill. 231

I WANT TO LEASE a telephone plant in a live, prosperous city; one that is not earning up to expectations. Can make it pay good interest to owners. I have references and money to back me. Address, Box 219, care of THE AMERICAN TELEPHONE JOURNAL, New York City. 219

POSITION WANTED—As manager or superintendent of an exchange or system. Up-to-date knowledge of the business and methods of operating. Energetic and not afraid of work. Able to secure and hold subscribers, also to take hold of a system and build it up to the highest point of efficiency. References. Address Box 214, AMERICAN TELEPHONE JOURNAL, 116 Nassau street, New York City. 214

WANTED you to know that I can locate your cable troubles. Charges moderate. Address C. E. NICHOLAS, Columbus, Ohio. 226

EXPERIENCED telephone man, capable to take charge of advertising or sales department, thorough knowledge of mail order methods and office systems, familiar with engraving and printing, wishes position with manufacturing or supply house in telephone or electric lines. TELEPHONE CONSTRUCTION EXPERTS

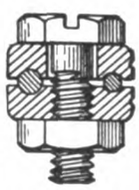
agree upon the desirability of using standard devices ethciently adapted to a variety of simiiar purposes. The

H. W. W. Wire-Connector

is a standard article of this kind. Each plate has two accurately formed grooves of different depths. By reversal of one plate around the bolt, this test-connector is **applicable to two wires of the same or of different diameters, large or small, toll or exchange, main or branch, terminating or through wires.**



Simple and effective. Inexpensive and economical.

Adopted as standard by Telephone Companies. Write for descriptive circular and quotations.

BENEDICT & BURNHAM BRASS AND COPPER CO.

Telephone Service for the City of Toronto.
Sealed offers will be received up to noon on
Saturday, October 1st, 1904,
for the installation and operation of a telephone business or service in the City of Toronto, upon terms and conditions which may be obtained from the City Clerk, City Hall, Toronto.
Each offer must be accompanied by a cash deposit, or a marked cheque payable to the order of the City Treasurer, for the sum of $5,000.00.
Any party failing to execute the necessary contracts to carry out his offer in accordance with the terms and conditions of the specifications will forfeit his deposit to the City.
Offers must be addressed to Thomas Urquhart (Mayor), Chairman of the Board of Control, and sent in through registered post.
The City does not bind itself to accept any tender.
THOMAS URQUHART (Mayor),
Chairman Board of Control.

Bituminized Fiber Conduit
For Underground Construction

Combines the **good features** of other conduits. **Eliminates** the **bad features** existing in many kinds. **Has valuable features** not found in any other ducts. :: ::
Made in 7-foot lengths with male and female joints, making construction very rapid and simple, with consequent low cost. :: :: ::
Alignment is perfect and permanent without tedious care and skill required in laying of butt-joint conduits. Users are astonished by the ease and rapidity with which cables can be drawn in, and this without the slightest scratching or injury to the lead covering thereof. Made in sizes from 1-inch to 10-inch diameter. ::
Bends of any radius and any angle. :: ::
Write us for further information and prices, stating sizes and quantities required. :: :: ::

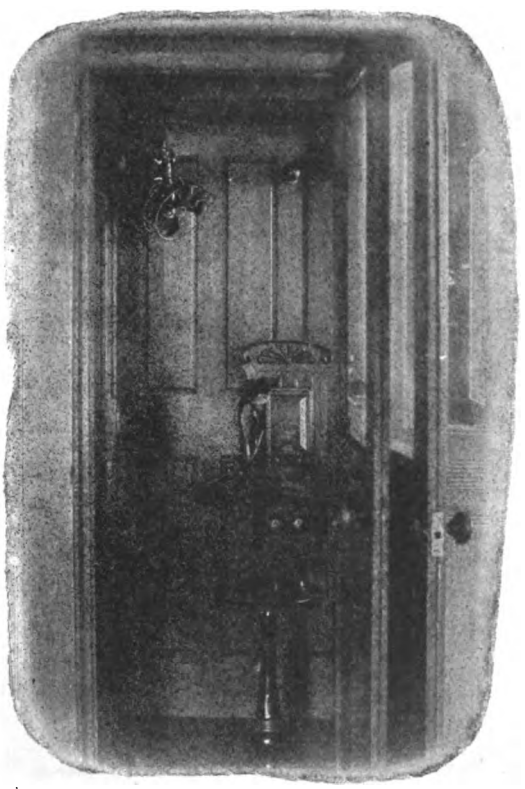
Telephone Booth Fan Motors.



A quiet, well lighted telephone booth adds much to its service to business men.

The only place where silence is really golden is in a telephone booth.

Discomfort of any kind in a telephone booth is an unnecessary evil.

The door must be closed to keep outside noise outside and inside talk inside. The inside air gets oppressive and the talker wishes for a "Wood" telephone booth fan motor.

It is small, light and slow speed and gives just the right breeze in just the right direction.

It is suspended on three spiral springs of calculated resiliency which deaden all vibration and noise.

Special windings permit the use of these motors in series with an incandescent lamp, lighting the booth and at the same time making it comfortable. Closing the door lights the lamp and starts the motor; opening it turns off the current.

The total energy consumed by lamp and motor is practically the same as for lamp alone.

A THREE-POUND MOTOR, AN 8-INCH FAN, 1,200 R. P. M. AND 20 WATTS MAKE PLENTY OF BREEZE AND NO NOISE.

Ask us about them now for next season.

TELEPHONE EXCHANGE ENGINEERING

ARTICLE XIX.—CONDENSERS

By Ray H. Manson, Albion D. T. Libby, and Charles A. Simpson.

A CONDENSER is a piece of apparatus for storing electrical energy in the form of a static charge. It is unlike the storage battery, which stores electrical energy by a chemical change, in that the charge is retained in electrical form.

The principle of the condenser is shown in Fig. 76, where *a* and *b* are two conducting plates of metal, such as tinfoil, and *c*

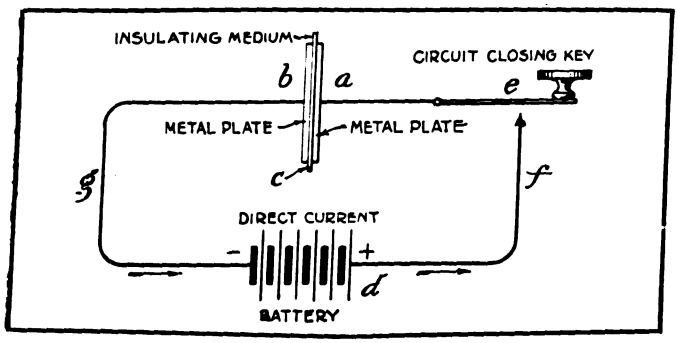

Fig. 76. Electrical Condenser in a Direct-Current Circuit.

an air space or sheet of insulating material. This separating medium is known as the *dielectric*, and in a commercial condenser is generally paraffined paper, mica or glass.

Condenser in a Direct Current Circuit.—If the plates *a* and *b* (Fig. 76), are connected to a direct-current source of electricity, such as the battery *d*, and the key *e* closed, current will flow and charge plate *a* positively and *b* negatively. When the key is

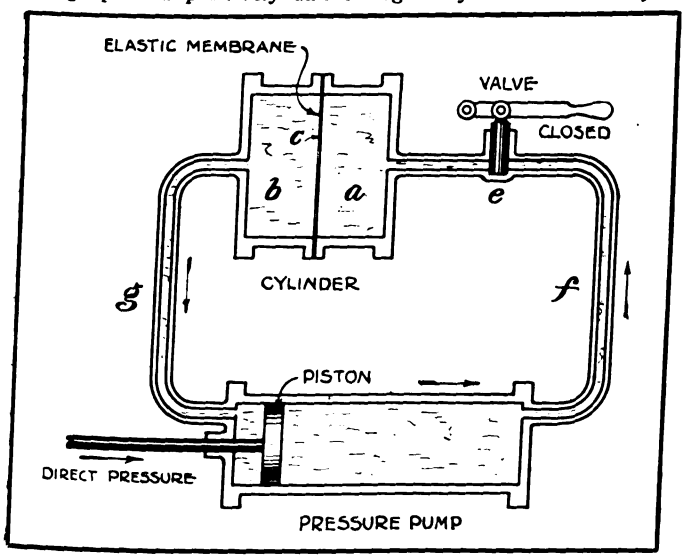

Fig. 77. Liquid Analogy of a Condenser in a Direct-Current Circuit.

opened the condenser remains charged, provided the insulation is perfect. It can be readily discharged by connecting plates *a* and *b* by a suitable conductor, such as wire.

Possibly the best way to illustrate condenser action is by a familiar water analogy. Electricity acts as an incompressible liquid, and can for convenience be taken as such. Water is more or less compressible, so in the following illustrations an *incompressible liquid* will be taken instead.

In the case of electricity, if a battery, or generator, is forcing

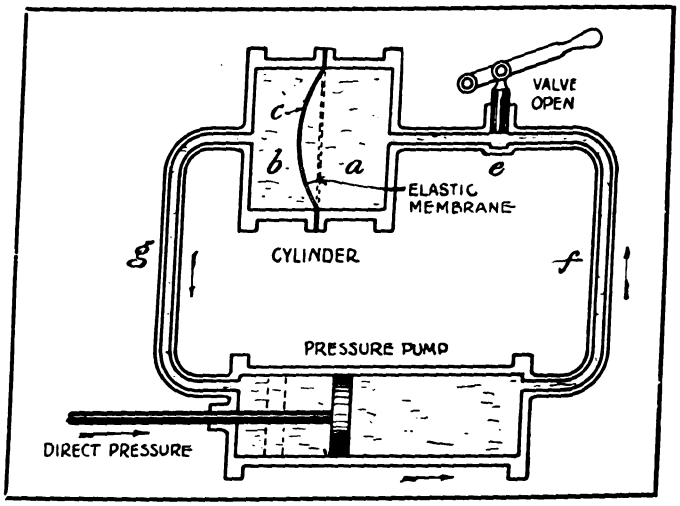

Fig. 78. Liquid Analogy of a Charged Condenser in a Direct-Current Circuit.

current out of its positive (+) pole, an equal amount must come in at the negative (—) pole. Also if the circuit is opened so that the current cannot flow in, it ceases to flow out.

Fig. 77 is a liquid circuit, made to operate similarly to the electrical circuit (Fig. 76). The pump corresponds to the battery, the cylinder to the condenser, the valve to the key and the connecting pipes to the wires. The dielectric is represented by an elastic membrance *c*, separating the cylinder into two parts, *a* and *b*.

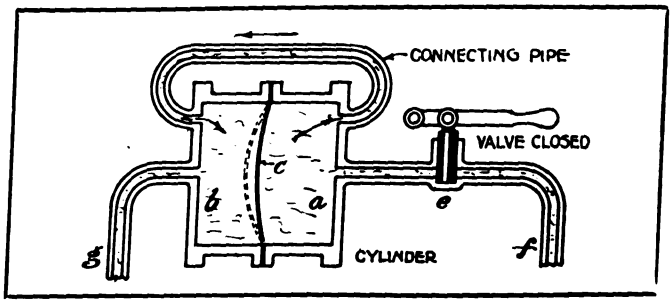

Fig. 79. Liquid Analogy of a Condenser Being Discharged.

Consider the pump, pipes and cylinder filled with the incompressible liquid. With the valve *e* closed, no liquid can flow into *a*, and thus the diaphragm *c* cannot move. This is the case in Fig. 76 with the key *e* open. Now with a certain direct pressure on the pump piston, and with the valve open, liquid will flow into *a* and an equal amount out of *b*, as shown in Fig. 78. The amount of liquid which it is possible to force into *a* depends on the pressure at the pump and the tension of the diaphragm, or in other words, when the elastic force of the diaphragm exerts a back pressure equal to the pressure at the pump, the motion of the liquid will cease. The operation of the electrical condenser in

Digitized by Google

Fig. 76 is similar. Electric current will flow from the battery into the condenser until the potential difference of the plates *a* and *b* become equal to the electrical pressure (electromotive force) of the battery producing the current.

With the cylinder charged and with the valve *e* closed, it is only possible to restore the pressure in the cylinder to normal by connecting *a* to *b* as shown in Fig. 79. The elasticity of the diaphragm *c* will force the liquid from *a* to *b*. This is equivalent to discharging the electrical condenser (Fig. 76) by connecting

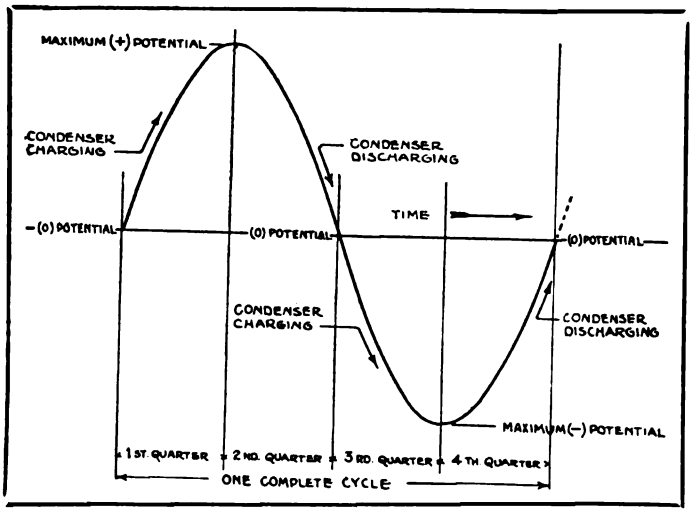

Fig. 80. Graphical Representation of One Complete Alternating-Current Cycle, Showing the Condenser Action.

the plates when the battery key is open. Any leakage in the cylinder, from *a* to *b* (Fig. 76), due to poor insulation, will eventually discharge the condenser, and as there is no perfect insulator at all, electrical condensers will slowly lose their charge, regardless of how well insulated its plates may be, and however dry the surrounding air. Insulation leakage losses are of great importance in commercial work.

Condenser in an Alternating Current Circuit.—If a condenser be connected to a source of alternating current, it will be charged to a potential equal to the maximum applied pressure (E. M. F.) during the first quarter of a cycle, discharged during the second quarter, charged again, but in the opposite direction

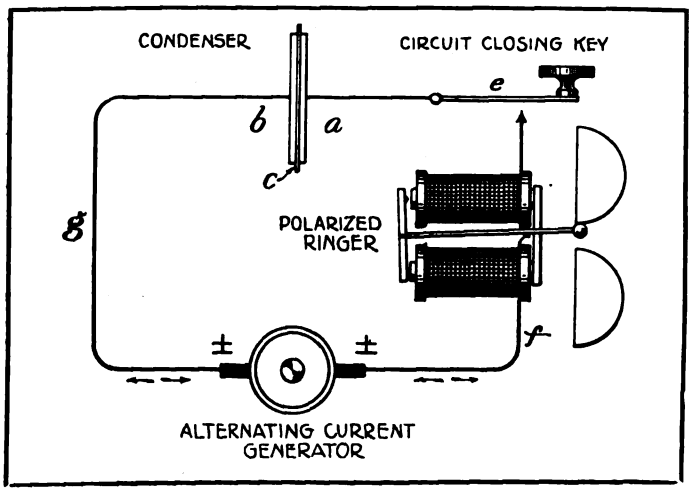

Fig. 81. Electrical Condenser and Polarized Bell in an Alternating-Current Circuit.

during the third quarter of the cycle, and discharged during the fourth quarter. This action, shown graphically in Fig. 80, will continue as long as the condenser remains in the circuit, and the source of alternating current continues to operate. Current will flow in the circuit wires just as though the plates of the condenser were connected together, due to the rapid charging and discharging. The presence of this alternating current is made evident by inserting a polarized electric bell (one designed to operate on alternating current) in the circuit, as shown in Fig. 81. When the key *e* is closed, thereby allowing the condenser to charge and discharge with the alternating current, the bell will be operated.

If a battery (direct current) was substituted in Fig. 81 for the alternating generator (alternating current) and the key *e* closed, there would be only one rush of current, sufficient to charge the condenser. This rush of current would have a tendency to tap the bell, provided the armature of the latter was in proper position to receive the electrical impulse. A discharge of the condenser through the bell would tend to throw the armature in the other direction, so that either the charge or discharge will tap the bell, unless some means is employed to prevent it. In central bat-

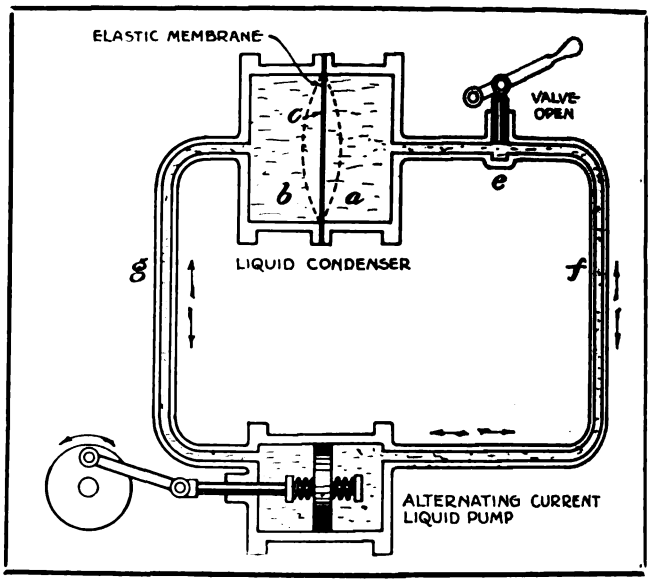

Fig. 82. Liquid Analogy of a Condenser in an Alternating-Current Circuit.

tery telephone working this action often causes much trouble and annoyance.

Returning again to the liquid analogy, it will only be necessary to impart a reciprocating motion to the pump piston, as shown in Fig. 82, in order to produce an effect similar to an alternating current. The motion of the piston forces the liquid, first into *a* and out of *b*, until the diaphragm *c* is extended to a point where its elastic force balances the pressure of the pump piston; then upon the return stroke, the liquid is forced into *b* and out of *a*, until

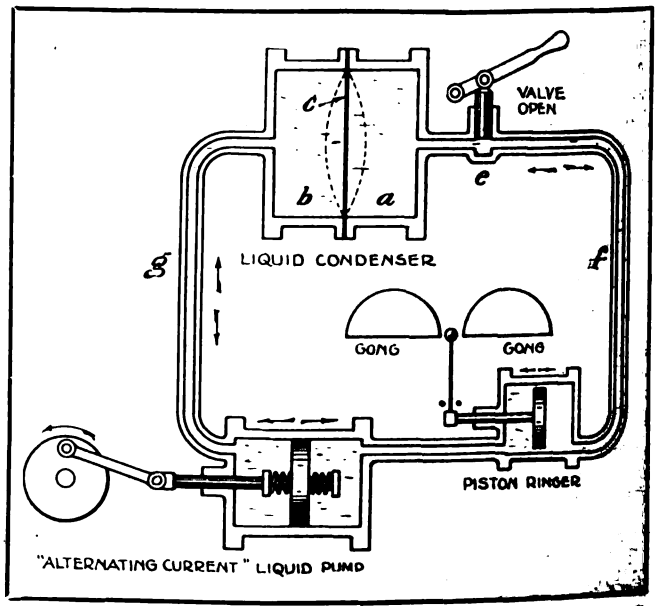

Fig. 83. Liquid Analogy of a Condenser in an Alternating-Current Circuit, With a Mechanism to Show the Movement of the Liquid.

the diaphragm *c* again balances the pump pressure. This cycle of operations continues as long as the valve remains open.

Now if a loose piston is inserted anywhere in the pipe circuit (Fig. 83), it will move back and forth with the movement of the liquid, and can be made to produce useful work, such as ring a bell. This bell acts in a similar manner to the one shown in the electrical circuit (Fig. 81).

Unit of Capacity.—The capacity of a condenser is defined as the quantity of electricity which must be imparted to it in order to produce a difference of potential of one volt between the plates.

Digitized by Google

The unit of capacity is called the *farad*; being the capacity of such a condenser as will be changed to a potential of one volt by one ampere of electricity in one second. In practice a condenser of one farad capacity would be too enormous to be constructed. It would take over 500,000 standard size telephone condensers to give a capacity of one farad. If these condensers were placed end to end their combined length would be over 852 miles.

A *practical unit* of capacity is therefore chosen, the micro-farad, or one-millionth of a farad. A one micro-farad telephone condenser contains about 2,400 square inches of tinfoil, with a dielectric of paraffined rice paper.

The capacity of a condenser depends upon: (1) The area of the facing surfaces of its plates; (2) The thickness of the dielectric medium between them; and (3) The dielectric capacity of the separating medium.

The dielectric materials have various powers of conveying the electrical influence of one plate to the other. This power of air as a dielectric is usually taken as unity, and that of other substances compared to it. For example, if two condensers are of exactly the same size, and in one of them the dielectric be a layer of air, and in the other a layer of paraffin, it will be found that equal quantities of electricity imparted to them do not produce

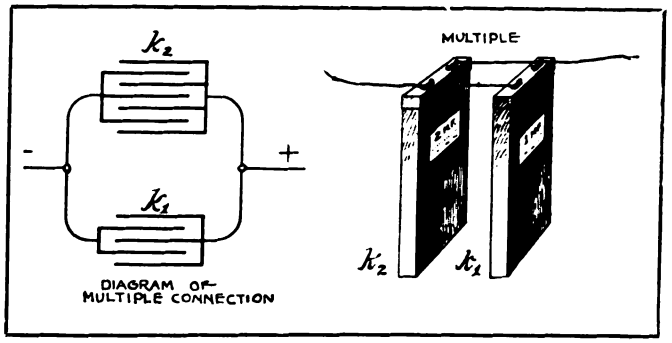

Fig. 84. Condensers in Parallel. The Joint Capacity is Equal to the Sum of the Separate Capacities.

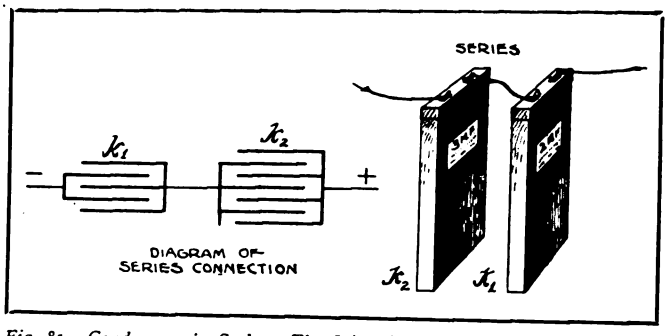

Fig. 85. Condensers in Series. The Joint Capacity is Less than Either of Them Separately.

equal differences of potential; or, in other words, it is found that they have not the same capacity. The capacity of the condenser with the paraffin dielectric will be about twice that of the air dielectric condenser. The following table gives the dielectric capacity (sometimes called specific inductive capacity) of several substances used in condenser construction:

Dry air (taken as standard of comparison)	1.00
Wax	1.85
Paraffin	1.92 to 2.47
Hard rubber	2.25
Shellac	2.74 to 2.95
Glass (hard and new)	3.10 to 10.00
Mica	5.00 to 8.00
Rice paper, paraffined, about	8.00

CAPACITY FORMULA.—The capacity of a condenser can be computed from the formula,

$$\text{Capacity, in microfarads, } C = 0.000000225 \frac{A\ k}{t},$$

where A is the area of one of the two plates in square inches; k the dielectric capacity, as given in the accompanying table, and t the thickness of the dielectric material, provided the plates are in close contact with it.

Example: What capacity will be obtained with a condenser made from tinfoil plates, each having 2,500 square inches of surface, and with a paraffined rice-paper dielectric 0.00225 of an inch thick?

$$C = 0.000000225 \frac{2500 \times 8}{0.00225} = 2 \text{ microfarads.}$$

These figures correspond to the specifications of one make of telephone condensers.

CONDENSER REACTANCE.—A condenser offers an apparent resistance to alternating current flow, depending on the frequency of the current and the capacity of the condenser. This property is called the reactance of the condenser and is expressed in ohms. The relation of capacity, frequency and reactance is given in the formula,

$$y = \frac{1}{0.0000062832\ f\ c}$$

where y is the reactance expressed in ohms, f the alternating current frequency (complete alternations per second), and c the capacity in microfarads.

A standard two-pole ringing generator is designed to operate at 1000 r. p. m., thus giving an alternating current of 16.66 complete alternations per second. The resistance of a two microfarad condenser when subjected to this current will be,

$$y = \frac{1}{0.0000062832 \times 16.66 \times 2} = 5000 \text{ ohms, approximately.}$$

Voice currents, which have a frequency of about 250 per second, meet with only 318 ohms resistance in a two-microfarad condenser.

The reactance formula also shows that a variation in capacity will change the resistance values. Thus with a one-microfarad condenser the values given in the above examples will be doubled. The ringing current will be resisted by 10,000 ohms and the voice currents by 636 ohms.

CONDENSERS IN PARALLEL.—If several condensers are joined together in parallel as shown in Fig. 84, they will act like one large condenser of a capacity equal to the sum of the separate capacities.

For example, a two-microfarad condenser connected in parallel to a one-microfarad condenser will give a joint capacity of three microfarads. The result is a condenser of larger plate area.

CONDENSERS IN SERIES.—If condensers are joined in series, as shown in Fig. 85, they will act as a condenser having a lesser capacity than either of them separately. The joint capacities in this case will be the reciprocal of the sum of the reciprocals of their capacities separately.

If two condensers, respectively 2 and 3 microfarads, are joined in series their joint capacity will be,

$$k_3 = \frac{1}{\frac{1}{k_1}+\frac{1}{k_2}} = \frac{1}{\frac{1}{2}+\frac{1}{3}} = 1\frac{1}{5} \text{ microfarads.}$$

A NOVEL USE FOR THE TELEPHONE.

ANOTHER illustration of the many uses to which a telephone can be placed is forthcoming from Paducah, Ky. It had been decided to paint the inside of a large standpipe belonging to the water company. To do this a raft was constructed to float upon the water within the pipe and serve as a platform on which the painters might work. A telephone was installed within the tube and connected with the pump room of the plant. When the men had painted as far as they could they would signal the engineer to raise or lower the level of the water as desired. In this way a great deal of time was saved as well as the cost of staging which had previously been used.

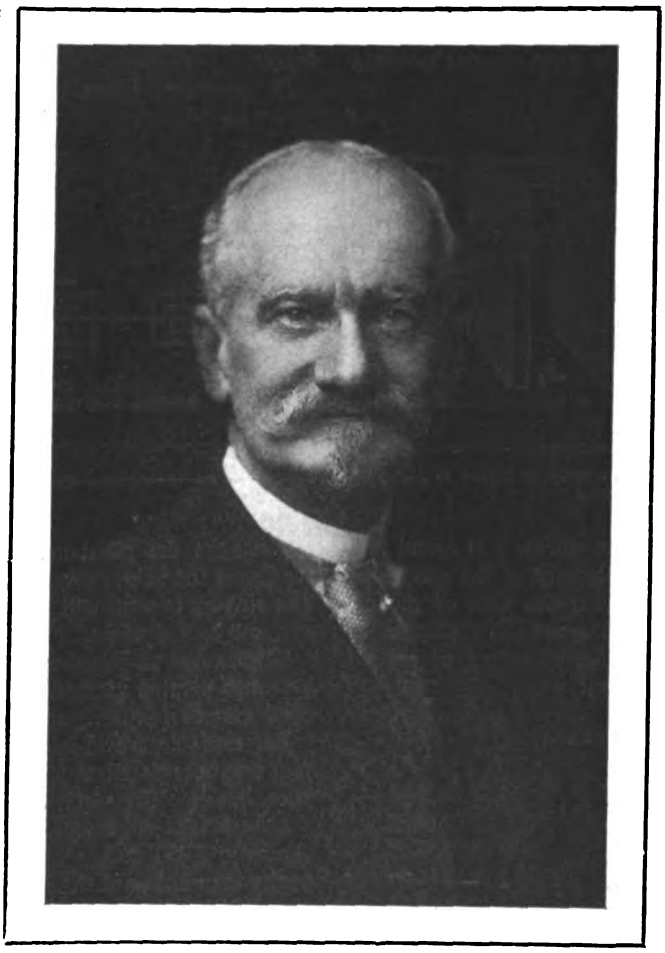
F. S. DICKSON AND HIS WORK WITH THE INDEPENDENTS

By E. C. Hopwood.

ONE of the prominent figures in Independent telephone circles of the Middle West is Frederick S. Dickson, president of the Cuyahoga, Federal and United States telephone companies. In addition to the ability to manage successfully these three corporations and look after the detail of a dozen subsidiary companies, Mr. Dickson has a personality so unique and striking that many of the things he has done have attracted widespread attention.

A word about the man's life is interesting. He was the son of Rev. Hugh S. Dickson and Sarah Stoever Dickson, and was born at Utica, N. Y., in 1850. His father was pastor of the Westminster Presbyterian church at Utica at the time. Later the family went to Philadelphia.



F. S. Dickson, President of the Cuyahoga Telephone Company.

Frederick Dickson entered the Sheffield Scientific School at Yale and was graduated in the class of 1871. He then took up the study of law and was admitted to the bar in 1873. Before this he had written "An Analysis of Blackstonestone's Commentaries," published in 1874. He is also the author of several other works, among them being a book on outdoor life, called "And the Wilderness Blossomed," published in 1901, and recommended by the New York Library Association.

In 1879 Mr. Dickson abandoned the law and entered business with John Wanamaker. Six years later "The Solicitors Co.," a Philadelphia corporation, was formed, of which Dickson became president, but, disagreeing with the controlling interests, shortly resigned. In 1893 he was made president of "The Abrasive Material Company," a corporation of which he is still the head.

In January, 1902, Mr. Dickson, as representative of the John A. Roeblings Sons Company and other creditors of the Everett-Moore syndicate, came to Cleveland. The Independent Telephone interests centering in Cleveland were in thorny ways; as a part of the syndicate they suffered from the embarrassment in which it found itself.

Mr. Dickson and George W. Beers, of Ft. Wayne, looked over the telephone properties and reported favorably to the bankers' committee in charge of the syndicate's affairs, and on October 27, 1902, he became president of the Cuyahoga and Federal Telephone Companies, to succeed Henry A. Everett.

He is one of the most strenuous of business men, and, with this energy fortified by his legal, scientific and business training, he went to work. The steps whereby he evolved order out of the chaos in which he found the companies' affairs were taken unhesitatingly and wisely. On May 21, 1903, he reported to the stockholders of the Cuyahoga Telephone Company as follows: "At our annual meeting in February we reported a deficit carried over from the past of $29,684. On the first of February this deficit had been reduced to $23,382; on March 1 to $16,801; on April 1 to $9,089, and on May 1 to $1,971. The first of June will, doubtless, show a surplus and this we hope to increase in the future." Mr. Dickson proved to be a good prophet, for the next month did show a surplus, which has been increasing constantly. What he did for the Cuyahoga Company he did for the other companies with which he was connected and, aided by the able assistants with which he surrounded himself, he infused new life into the Independent telephone business in Cleveland.

As soon as the Cuyahoga Company began to earn a surplus Mr. Dickson put into operation his profit-sharing project, a system of which he has always been an advocate. It was tried in Cleveland with the employees of the Cuyahoga Company for the last six months of 1903 as an experiment. The letter he wrote to the employees announcing the plan was characteristic in the extreme. The substance is as follows:

"Dear People—I am not quite satisfied with your work. I do not think it is very bad, but I am sure it is not as good as it could be and, therefore, is not as good as it ought to be. You are doing pretty well, but you are not doing your best. You know this business was started so that it might earn money for those who have invested money in it. Now, money can be made out of this business if good service is rendered to our customers, but the character of the service will depend upon the character of your work. If your work is good, the service will be good. If you are patient, polite, prompt and skilful you can give very good service with second-rate equipment, but if you are petulant, rude, dilatory and careless the service will be poor, even if we have the best equipment in the world.

"Now, I want all of you to feel that each of you have a real interest in the success of this company. I want every one of you to smile when you hear the company praised for the character of its service, and to take to yourselves part of the credit for making the service good. Remember, if we have careless employees, it will reduce our profits. If we have any employees who shirk their full duty, it will reduce our profits. If calls are not answered promptly, our subscribers will leave us and there will be no profits. If our solicitors are not active, we cannot increase our business. If our collectors are negligent, or show want of tact, we will not get paid even for the service we have rendered. We are bound close together, whether we like it or not, and the failure of one to do his full duty renders worthless the honest labor of others. Whether we make good profits, or none at all, will depend upon the way your work is done, therefore, I feel that if you honestly help us to earn money, you should honestly share in the money earned, just as you have shared in the labor."

Mr. Dickson then outlined his plan, which was to set aside

Digitized by Google

one-fifth of the surplus remaining at the end of six months, after expenses, taxes and interest on bonds were paid, to be shared by the employees in proportion to their salaries. A good deal of Mr. Dickson's gospel was contained in the following paragraph:

"Remember, the easiest way to make money is not to spend it. Do you realize that all of you are spending money for us? If you injure any part of our apparatus, you have spent the money it costs to repair it. If you cut wire to waste, you have spent the difference in value between good copper wire and junk. If you use a good sheet of paper to figure on, where the back of an old envelope would serve as well, you have added to the cost of operating this plant."

The employees took up the plan with a will and it proved so satisfactory that it was made permanent by the stockholders.

Mr. Dickson led the Independents in and won the fight against Postmaster General Payne's order barring Independent telephones from being used in the postoffices of the United States.

Under Mr. Dickson's administration the Cuyahoga Company has added one of the finest switchboards in the country to its equipment. An active campaign for business has begun and the list of subscribers is growing rapidly. Extensions and betterments are constantly being made to the Federal and United States Companies and the whole Independent situation is in a healthy and prosperous condition. To give the best service at a fair rate has been the aim of President Dickson and his associates, and the reports of the various companies seem to indicate the success that has followed.

Personally, Mr. Dickson is one of the pleasantest men to meet. He is the embodiment of nervous energy and has the reputation of being the hardest working corporation president in Cleveland. Generous and considerate with his employees, he insists on the best in them in return, and those who attempt devious or dilatory tactics are soon looking for something or someone else to do.

MAINTENANCE

ARTICLE II.

By Arthur Benson.

"OPENS."—Generally speaking, where an open-wire line is open, either on one or both sides, the fact can be determined by noting that communication cannot be established between the two terminal points. On long lines, however, where peculiar conditions exist, communication can be carried on when the line is open on only one side. This point will be discussed later.

The method adopted for clearing "opens," whether swinging or otherwise, or whether on one or both sides of the line, is as follows: A line having been tested from the exchange and found to be open, the point at which the trouble is located is found by making successive attempts to communicate with the ex-

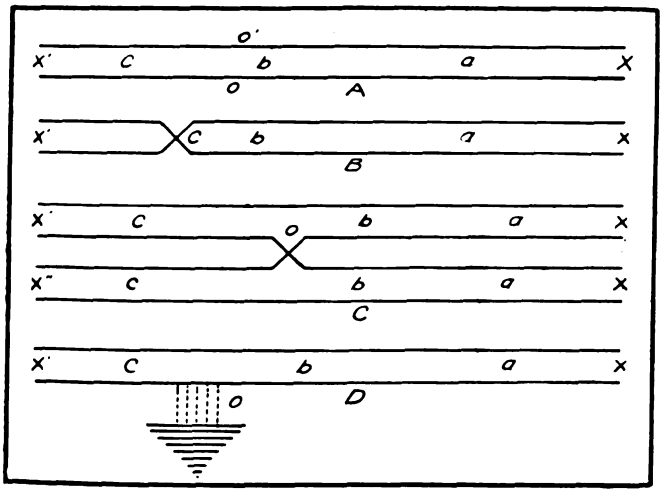


Fig. 3.

change, at each one of the accessible points throughout its length. This point will be illustrated by reference to Fig. 3 *a*. Here a metallic circuit is shown running between the exchange, *x*, and the subscriber station, *x'*. Suppose that the accessible points are at *a*, *b* and *c*, respectively, and that the portion of the line between *x* and *a* is made up of underground cable. That between *a* and *b* is made up of aerial lead cable. That between *b* and *c*, of open wires, and that between *c* and *x'* of drop wire. Suppose, further, that the line is open on both sides at *o* and *o'* between *b* and *c*.

This line being tested from *x* would be found to be open through the inability of the person testing to raise *x'*, and the trouble man upon going out would connect his test box to the line at the point, *a*, which would be in the nature of a cable box. Upon doing so he would find that he could raise the exchange, *x*, but not the subscriber. He would then proceed to the point, *b*, which would be in the nature of another cable box, through which the aerial cable passes to the open wires. He would again put himself into communication with the line, and again find that he could raise *x*, but not *x'*. He would thereupon proceed to the point, *c*, where the drop line is connected to the open wires, and make a similar test. This time, however, the conditions would be reversed, for he would be able to communicate with *x'*, but not with *x*. This result would show that the point of trouble lay somewhere between *c* and *b*. He would then inspect that portion of the line, locate and clear the trouble.

This process of locating trouble is one of trial and error, and it might appear as if the time taken thereby would be excessive. As a matter of fact, an experienced trouble man is able to save himself a great deal of needless testing by his knowledge of the points at which the line is likely to be thrown in trouble. This point will be taken up in detail below.

Short Circuits.—The method of clearing short circuits is similar to that just described, with one very important exception, viz.: When a line is open, as in Fig. 3 *a*, there results two good portions of line over which conversation can be carried on in the usual manner: that between *o*, *o'* and *x*, and that between *o*, *o'* and *x'*. In the case of a short circuit, however, the whole line is put out of service, no matter on which portion the trouble is located. Before communication can be re-established the trouble must be cleared. Fig. 3 *b* illustrates this point. Here assume that the same line running between *x* and *x'* is short circuited at *c*, no matter at what point the trouble man connects for a test the short circuit at *c* will prevent him from raising either *x* or *x'*. His method of testing must consist in cutting out the defective portion of the line during his test, by temporarily opening it at the point of testing. For example, the lineman goes to *a* and, opening the line on both sides, tests towards *x* and raises the operator. He then disconnects himself from that portion of the line, and, connecting himself to the opposite portion, tests towards *x'* and finds the short circuit. He then knows that the trouble lies between *a* and *x'*. He proceeds next to *b*, and, opening the line on both sides, tests both ways again. His ability to raise *x* shows him that he has not yet passed the trouble point. He repeats the test at *c* and discovers that the trouble lies at that point. When the trouble is cleared, he closes the line and, going in with the test set, endeavors to raise both *x* and *x'*, and his ability to do so proves the line to be O. K.

Crosses.—Crosses act like a short circuit by throwing the whole line in trouble. Illustrated in Fig. 3 *c*, where two lines are shown, both coming from the same exchange, *x*, and passing through the cable boxes, *a* and *b*, and taking the drop lines at the same point, *c*. Suppose that the two adjacent conductors are crossed at *o*, obviously the resultant cross talk would be heard upon any portion of either one of these two lines. For even when

Digitized by Google

only one conductor of each line is in mutual contact a closed metallic circuit results through the instruments and drops on each line.

The process of testing for crosses resembles, therefore, that employed in locating short circuits, but is more complicated. Proceeding to the cable box, *a*, the trouble man goes in on either one of the two lines—for example, the upper one—and rings. Upon so doing the drop and the telephone bell on the upper line will be operated in the usual manner, while those on the lower line will be operated over the circuit formed at the cross, *o*, unless the resistance of this contact should be very high. Both operators, and probably both subscribers, will answer the call, and the trouble man, listening in, will hear the conversation on both lines. If the upper line be opened at *a* and a test made toward the exchange the cross ringing and cross talk has been removed. If, however, still keeping the line open at *a*, the test be made toward *x'*, the cross ringing and talking will still be found. This test should be repeated on the lower line as a measure of safety, because where a cross exists, other trouble may accompany it, and with a view of locating it, both the affected lines should be tested thoroughly.

The test is repeated at *b* and *c*, with the result that the cross is located between *b* and *c*. It sometimes happens that several lines become crossed together, causing not only "crosses," but also "short circuits." This condition, with the exception of the falling of poles, occurs only in cables, and will be dealt with later.

Grounds.—In locating no other class of trouble is experience of so much value. This class can vary from a dead ground on both sides to an escape on one side, and while the same general plan is followed in locating the fault, a trained ear is essential in the clearing of the trouble. The reason for this is not far to seek. All grounds, excepting the lightest escape, make the line affected more or less noisy, and the character and intensity of the noise determine not only the nature of the ground, but also its location.

Fig. 3 *d* shows a line running between the exchange, *x*, and the subscriber station, *x'*, and grounded on one side at *o*. Under this condition the line is noisy unless the ground amounts only to a slight escape. It is possible, by going in at *a*, *b* or *c*, to raise both *x* and *x'* and even to carry on conversation with these two points, although the presence of the noise may render it very indistinct.

The trouble man would go to the cable box, *a*, and "listen in" on the line. He would note the nature and intensity of the noise, and the information thus obtained would serve to direct his further efforts. He would then open the line at *a* and test toward *x*, and find that portion to be free from trouble. He would close the line through and proceed to *b*, where he would repeat the listening-in process and also the test. The chances are that he would not need to repeat the test at the point *c*, as the information already obtained would, together with his knowledge of the construction of the various portions of the line, be sufficient to enable him to locate the trouble in the portion of the line between *b* and *c* and render it unnecessary to make a third test at *c*. If the line is dead grounded on both sides, the chances are that no noise will result, and the conditions will be those resulting from a short circuit.

Probable Points of Trouble.—Nothing has been said about cut-outs or swing trouble of any nature. Troubles of this kind must be located by the aid of experience, as from their character there is no cut-and-dried method of testing that will serve the purpose. The experience referred to is derived from two sources. First, a trained ear, which means, in addition to increased sensitiveness of the organ, the ability to distinguish the different noises made by the various classes of trouble. Second, from the knowledge of line construction, the ability to pre-determine the probable location of the various classes of trouble.

Each one of these two kinds of experience assists the other. A trouble man, listening on a line, determines by the character of the noise that there is a swinging ground which, when "in" produces "trolley induction," and he reasons in this fashion: "Since the trouble is of a swinging nature it must be on some part of the line that is exposed to the action of the wind or mechanical shock, and so it is located somewhere in the open wires, probably at a pole where a guy is placed. Since the line parallels for a considerable extent of trolley line, the presence of the induction is perfectly natural. If the line was not so situated, the inference would be that the presence of induction was caused by a 'cross' with some line which did parallel a trolley road." Thus it will be seen that his knowledge of line construction forms a guide to his ear in locating the trouble.

A trouble man was once sent on a cut-out, the line affected running for a considerable distance along the elevated railroad structure. After going to the various accessible points and listening in without being able to locate the trouble, he sat down on the platform of a station past which the line ran and began to think it over. He had observed that the cut-out appeared about every five minutes, and lasted for a period of about four seconds. Just then a train approached, stopped at the station, and started on its way again. As soon as the last car had cleared the station, he jumped down on the track, seized with a sudden idea, and listened in on the line. As the train approached the next station the cut-out came in, and lasted until the train stopped. He hastened down to a point near the next station, where the line sprang off from the structure, and, upon examination, found a loose connection, which, when the structure was jarred by the passage of a train, caused a cut-out.

Cut-outs caused by loose joints are particularly hard to locate, especially on long toll lines, for the reason that, since the touble appears only at intervals, the trouble man cannot feel sure that, when getting an O. K. test with either end, the portion of the line in trouble has been cut out, or that the O. K. is merely due to the fact that the cut-out did not come in when the test was made. Referring to Fig. 3 *a*, the trouble man goes to *a* and, opening the line towards *x'*, may, when testing with *x*, get the line O. K. and when testing with *x'* get the same result. Upon proceeding to *b* he might get a cut-out towards *x* and O. K. towards *x'*. Under these conditions he would return again to *a* and repeat the test. But this time he might get a cut-out towards *x* and O. K. towards *x'*. So that it will be evident that the location of such a trouble is by no means an easy task, especially where long journeys have to be made between testing points, and it is only with the exercise of the utmost skill that the work can be accomplished.

THE TELEPHONE AS A MESSENGER.

THE value of the telephone upon the farm has often been illustrated, but two news items have been received which tend to show further its value in securing aid when such is needed. At a farm down in Texas a little boy was accidentally run over by a mowing machine and had one of his legs cut off. Luckily there was a telephone at the farmhouse, and the doctor who lived twelve miles away, was communicated with and was able to get to the farm in time to save the boy's life.

Another case is at hand from the same neighborhood, in which a country store was broken into and $30 stolen. By means of the telephone all the farmers within a radius of fifty miles were told to be on the lookout for any strangers, with the result that two of the men were arrested at a point forty miles away from the scene of the robbery.

IN KANSAS CITY.

CLIFFORD DOWLING, a negro boy, eight years old, was found by the officers of No. 8 station in the East bottoms the other night trying to get into Electric park. At the station the boy told the sergeant that he ran away from the negro orphans' home at Howard and Michigan avenues.

"Have they got a 'phone out there?" asked the sergeant.

The negro thought earnestly for a moment and then told the sergeant that there was a 'phone at the home.

"Which 'phone?" asked the sergeant.

Again the negro boy pondered deeply, then his white teeth were shown in a smile as he remembered an almost forgotten pleasure.

"Hit am a graphophone," he answered.

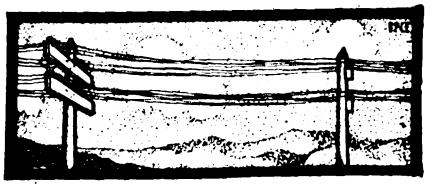
QUERIES

Questions on any subject relating to telephony will be answered on this page.



TRANSPOSITION.—(420.)

Will you please illustrate with diagram how to connect a grounded line with a metallic one? We have two lines that cross-talk very badly—one a private line, the other going to the exchange. For about a mile they run parallel and then branch off from one another. As there are no electric light or trolley systems to bother us, we thought to run metallic circuits to the point where the lines branch off and then use grounded lines.

ST. K. T. CO.

In Fig. 420 is illustrated the method of connecting a grounded line to a metallic one. One-half of the coil is connected to the

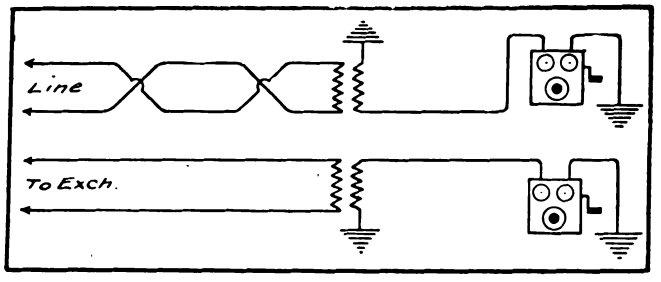


Fig. 420.

metallic circuit, the other half is grounded on one side, the other side being connected to the line. It would be necessary to transpose both of the metallic circuits. In purchasing your coils you should tell the manufacturer what you want them for, because a coil intended for talking through only would not transmit ringing current in a large enough quantity to operate the bells or signals.

BELLS RING FAINTLY.—(421.)

We have a good deal of trouble with our magneto bells on one of the lines; they don't seem to ring at all well. There are fifteen instruments on this line. Can you suggest what the trouble is and supply a remedy.

L. T. C.

We would suggest a very thorough examination of the line, to see that it is not shunted at any point. A shunt may occur in any one instrument or in the inside wiring of any station, or in the switchboard. A good way to find out if this is the trouble would be to open the line at the exchange and test through the switchboard to the protective devices. If you haven't a voltmeter for this purpose, a receiver placed in series with the line will do. If you don't hear any noise in the receiver it will show the line to be clear and open so far. Now go out and open one instrument at a time, and notice whether the bells of the other instruments ring any better. Continue to do this with all the instruments, being sure the lines are opened where they connect with the inside wiring. If you are unable to locate the trouble this way it would appear that the line was too heavily loaded for type of bells and generators used. The resistance of bells for such a line as this should not be less than 1,600 ohms and the generators should be of the fire bar type to give the best results.

INSULATORS.—(422.)

Will you kindly inform me through the medium of your paper what is the better material to use for insulators, porcelain or glass? B. C.

Briefly stated, porcelain has the following advantages: Its insulation resistance is 5 or 6 times that of glass. It is more durable and less likely to be broken. It is less hydroscopic. That is to say, does not as readily condense moisture upon its surface.

Glass possesses the following advantages: It is cheaper than porcelain. Since when exposed to the air both porcelain and glass become coated with moisture the actual insulation resistance of each is equal. Glass, being transparent, no shaded surfaces are present in which spider webs and cocoons can be found. The broken surfaces in glass present the same imperviousness to moisture as do the whole surfaces, while the broken surfaces of porcelain absorb moisture, thereby reducing the insulation resistance. All things considered, glass is the better material to use.

RINGING THROUGH REPEATING COILS.—(423.)

Is it possible to ring through repeating coils without much loss of potential? R. J. S.

A repeating coil to produce the best results in the transmission of speech is designed upon somewhat different proportions than the one which is best adapted for ringing. It is difficult and sometimes impossible to ring through the ordinary repeating coil that is designed only for transmission, but if a coil is properly proportioned, it is possible to talk through it and to ring through it with almost equal facility. In general terms, about ninety per cent. of efficiency can be expected.

SAG IN LINE WIRES.—(424.)

Will you kindly give me a table of allowable sag of line wire, for different length spans and different temperatures? C. W.

Following is the table you request, worked out for spans from 75 feet to 200 feet in length, and for temperatures in Fahrenheit degrees from 30° below zero to 100° above zero:

Temperature in degrees Fahrenheit.	Span 75 ft. sag.	Span 100 ft. sag.	Span 115 ft. sag.	Span 130 ft. sag.	Span 150 ft. sag.	Span 200 ft. sag.
— 30°	1 in.	2 in.	2½ in.	3½ in.	4½ in.	8 in.
— 10°	1½ "	2½ "	3 "	4 "	5 "	9 "
+ 10°	1½ "	3 "	3½ "	4½ "	6 "	10½ "
+ 30°	2 "	3 "	4 "	5½ "	7 "	12 "
+ 60°	2½ "	4½ "	5½ "	7 "	9 "	15½ "
+ 80°	3 "	5½ "	7 "	8½ "	11½ "	19 "
+100°	4½ "	7 "	9 "	11 "	14 "	22½ "

SEASONED RESISTANCE COILS.—(425.)

A prominent manufacturer of Wheatstone Bridges, in advertising his instruments, states "the platinoid coils in their sets are properly seasoned and will not gradually change their resistance." Do metals actually change their resistance with age, and how are platinoid coils seasoned? F. W.

When any metal is drawn into wire, the process of forcing the metal through the die disturbs its molecular condition and produces an effect which is somewhat similar to that of tempering steel. As time elapses, this artificial molecular condition gradually

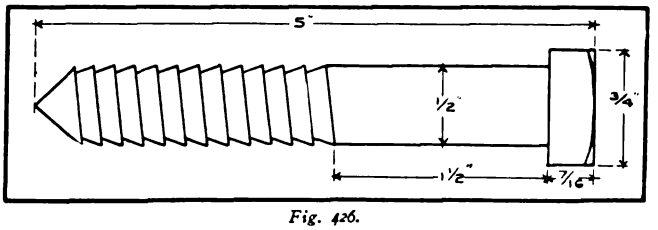

Fig. 426.

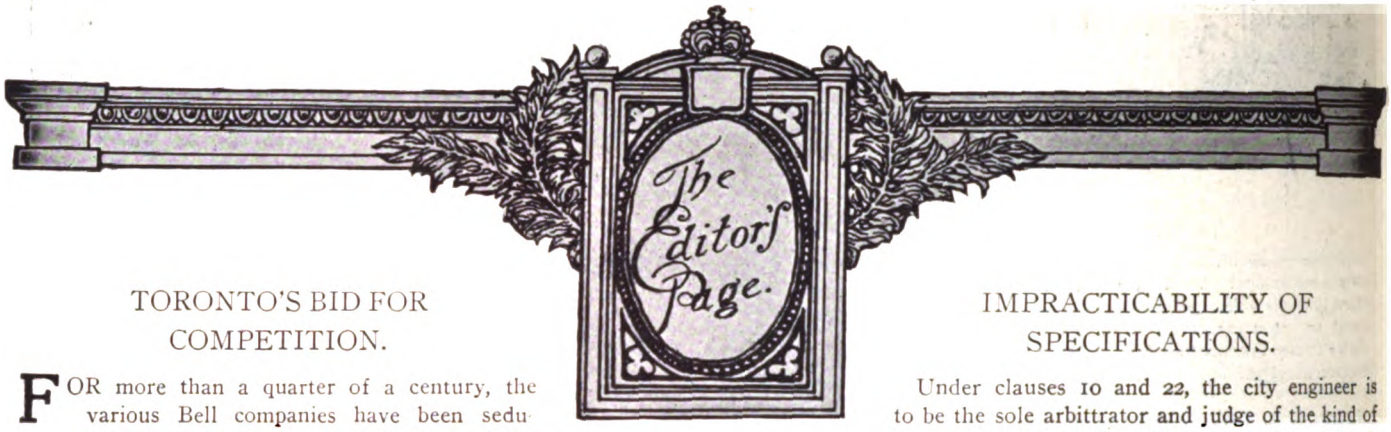
changes, and the molecules of the metal tend to resume their original condition. This effect produces a certain change in the resistance of the wire, consequently unless some means are taken to counteract it, coils which are standardized when the wire is freshly made will not retain their original resistance. The process which is used for aging, as it is called, simply consists in heating the wire to a low temperature for a prolonged period of time exactly in the same way as a piece of steel would be annealed.

LAG BOLT.—(426.)

Is there any special style for lag-screws? If so, will you please give them. G. R. N.

The standard size of cross lag bolts or fetter drive screws is shown in Fig. 426, which gives dimensions.

Digitized by Google



TORONTO'S BID FOR COMPETITION.

FOR more than a quarter of a century, the various Bell companies have been sedulously carrying on a campaign of gratuitous public education—endeavoring to educate the American people in the mutual relations of telephone corporations and their patrons. But concisely and in the vernacular, the ethical code of the Bell is comprised in the single sententious and pungent sentence, *"The public be damned."* Considering the care and thoroughness with which this idea has been inculcated, it is perhaps not surprising that the people have come to believe in a general way that all telephone companies are ruthless and wanton.

Disgusted at the service supplied by the Bell Company and encouraged by the success of municipal telephony in Great Britain and the Independent methods in the United States, it appears that the city of Toronto, one of the most enterprising Canadian towns, desired competition. To this end its mayor has issued a document entitled *"Specifications for the Installation and Operation of a Telephone Business or Service in the City of Toronto."* The object of this pamphlet is to set forth the conditions under which the city of Toronto wishes to invite capitalists to undertake the construction and operation of an Independent telephone plant. In the formulation of the regulations which are herein set forth, it seems as if the Toronto authorities had reacted against the evils which have in the past accompanied telephonic installations in that city, and gone so far as to prescribe measures which are in some cases exceedingly drastic and likely either to repel would-be investors, or to cause them to exact rates for service which will be onerous to the subscriber. The following quotations from the various clauses of the specifications are abstracted, indicating requirements which either should be modified or are likely to be exceedingly repellent to Independent capital:

> Clause 1. Tenders or applications will be received by the Board of Control (hereinafter called "the Board") of the Corporation of the City of Toronto (hereinafter called "the Corporation") for the privilege of installing and operating a telephone business or service in the City of Toronto (hereinafter called "the City") for the period of ten years from the day of , 1904, upon the terms and conditions hereinafter set forth.
>
> Subject to the terms and conditions herein contained, the applicants shall be granted the right to operate a telephone system and also long-distance connections for a period of ten years as aforesaid, within the city limits as they at present exist, or as they may be extended within the said period or periods as hereinafter provided. Such right to operate may be renewed by the Cty for further consecutive periods of five years each, at the option of the City, upon the terms herein contained, so far as applicable, or upon such terms as may be agreed upon.

By this quotation it is seen that investors may be limited to a period of ten years of operation, and, assuming this to be rigorously enforced, and subsequent renewal be denied, such rates must be charged as will enable the capitalist to recoup within this period the investment in the plant, as well as the proper and normal charges for service.

According to clauses 6 and 7, the telephone company must guarantee to get 2,000 subscribers and must further guarantee to keep on getting subscribers at the rate of 500 in every three months. Who can say in advance that it is possible to obtain so many subscribers? It is quite conceivable that a company might be unable to secure as large a subscription list.

IMPRACTICABILITY OF SPECIFICATIONS.

Under clauses 10 and 22, the city engineer is to be the sole arbittrator and judge of the kind of apparatus and quality of service to be rendered. Now, telephony is a business requiring the study of a lifetime, and an adequate decision as to what constitutes proper facilities and reasonable service is as much expert opinion as the diagnosis of a physician or the verdict of a lawyer. If the city engineer is an expert telephonist his opinion might be of value, but his expertness is an open question, and it is certainly as unreasonable to appoint him a final court of appeals in the case of the telephone company, as to expect him to pass upon the conduct of the board of health during an epidemic of small-pox. Another clause further along seems even more unfair. It reads:

> Clause 28. No service other than a telephone service shall be given over a telephone wire to any subscriber for a telephone in the city without the consent of and upon an agreement with the Corporation defining the terms and conditions of such service.

The hardship of this clause lies in the fact that it restricts the company in the use of its apparatus to a degree that may prove very onerous in the future. It is conceded by all students of telephony that the time is coming when an important part of an operating company's revenue may be obtained from what are known in industrial enterprises as "side-products." That is, in telephony, the use of the wires for purposes of fire alarm, burglar alarm, telegraph, or such other attachments as may be worked simultaneously over the same lines. The Bell long-distance company has already begun to harvest part of their by-products through leasing its wires for telegraphing. To deny a new company the right to so employ its property is, to say the least, an arbitrary condition and one that will not invite the best results either to the city, to the subscribers or to the investors. To be sure, in a subsequent clause, an endeavor is made to meet this objection in a way, but any practical man in the business must see that it is absolutely useless, because no operating company, as matters now stand, and in the present stage of development, is in a position to forecast the future sufficiently to avail itself of the opportunity here set forth. The amendatory clause reads as follows:

> Clause 32. Applicants may put in an alternative tender for the supply of light, power, or any other service, by means of the wire, or wires, conduit or conduits to be used in connection with the telephone service embodying in the tender the terms upon which such light, power or other service is to be supplied, but shall not include any of such services unless in connection with a telephone service to a customer.

We heartily commend the evident good faith of Toronto's mayor in endeavoring to carefully safeguard the interests of his town, and we believe that in the long run contracts which are so framed and drawn as to be mutually fair to both parties are in the interest of capital. But it is manifest that one-sided contracts such as is proposed here are detrimental to the best interests of the telephone using public. The proper course requires both parties to meet upon some middle ground which shall be determined by mutual consultation and to frame a contract which is fair and just to both from all standards. We therefore earnestly recommend the mayor of Toronto to get expert telephonic advice from any of the well-known unprejudiced telephone engineers and to revise and remodel the specifications in such a manner as to secure for his town the best service at the lowest profitable rates.

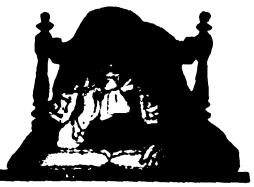
The Telephone in the Courts



Conducted by A. H. McMillan.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

HOUSE MOVING AND TELEPHONE CABLES.

We own a franchise for the erection of poles, wires, abutments, and all other necessary appliances for the successful conducting of a telephone exchange, in a village of about one thousand populationn. By right of said franchise, we erected a cable extending from one end of the village to our central office, near the center of the village. The cable is 18 feet from the surface of the street. Parties desire to move a building along the street over which our cable crosses, and the height of the building will necessitate the cutting of our cable, at a cost to exceed $100.

Has the telephone company the right to enjoin the moving of said building as far as it interferes with its cables? Or if not, has the company the right to enjoin the moving of the building until sufficient funds are deposited with it to pay the actual expense of cutting and splicing the cable, or a bond is given to cover said expenses? Please give authorities. M. M. H.

IT has been decided by the courts that a telephone company has the right to enjoin the moving of a building that interferes with its lines. This was in the case of the Northwestern Telephone Exchange Company vs. Anderson, recently decided by the Supreme Court of North Dakota. Anderson was licensed by the city to move houses, and given special permission to move a frame building through the streets. The company secured an injunction to prevent the interference of its wires. The injunction was dissolved upon the giving of a bond by Anderson to indemnify the company against damages. The house was moved and suit brought on the bond by the company to recover about $200.

The court held that the franchise of the company was a vested right that could not be impaired by subsequent action of the city directly or indirectly annuling it for purposes not public. The use of a street for moving houses is an extraordinary use thereof, and may be permitted, but not so as to destroy the use of the street for travel and other public purposes. It could not be done in impairment of vested rights, such as were held by the telephone company. Northwestern Tel. Ex. Co. vs. Anderson. 98 N. W. 706.

INTERSECTING LINES AND GUARD WIRES.

HARRY J. RUBIN sued the Richmond & Petersburg Railway Company for damages for the burning of his stock of goods. He alleged that the fire which consumed his store was caused by the defendant's agents moving the poles of the Long Distance Telephone Company of Virginia, and weakening the company's wires so that one or more of them broke and fell upon the wires of the defendant and carried from them electricity to the plaintiff's store, thereby setting fire to it. The plaintiff further alleged that defendant was negligent in running its wires under the wires of the telephone company so close as to incur risk of contact and without erecting guard wires between its wires and the wires of the telephone company. The railway company in defence alleged that it was under no obligation to erect guard wires, and that the telephone company's wires were broken by the sleet caused by a storm so violent and extraordinary that the history of climatic variations afforded no reasonable warning of it.

The court held that the Electric Railway Company, in exercising reasonable care, should offer a very high and exact measure of foresight, skill, diligence, and inspection; and that where a company negligently fails to maintain such devices between its trolley wires and telephone wires, it becomes responsible for injuries which result from contact between the two kinds of wires, its negligence being the proximate cause of the accident. The question of whether or not the defendant had exercised the proper degree of care, was a question for the jury. The jury having decided it in favor of the plaintiff and given him a judgment, their result would not be overturned. The court made the same ruling in respect to the jury's determination of the question of whether or not the breaking of the telephone wire was caused by an extraordinary storm.

Richmond & P. Elec. R. Co. vs. Rubin, 47 S. E. 834.

CITY OF ELGIN SEEKS TAX.

MUNICIPAL corporations all through the Middle West, where the Chicago Telephone Company operates lines and possesses franchises, are watching with interest the progress of the suit recently commenced by the city of Elgin to tax the corporation the sum of $1 per annum for each telephone in use in the city. The company holds its grant in Elgin by virtue of an ordinance similar to that in effect in nearly every city wherein the corporation does business, and the outcome of the litigation bears considerable import.

The ordinance of 1881, the original measure by which the council granted the company permission to erect poles and operate lines in Elgin shows that there is no limit to the city's authority. A portion of this ordinance, as cited in the bill, is as follows: ". . . that the Chicago Telephone Company is hereby authorized to erect telephone poles in the streets of the city of Elgin and to construct and maintain a line or lines of telephone in connection with same. All proceedings of said telephone company and the privileges acquired under this ordinance shall be subject to any ordinance relating to the same which may hereafter be passed by the city council of the city of Elgin."

This ordinance was accepted by the telephone company in a letter written to officials. The bill further cites the ordinance passed last spring by the city council, wherein the company was taxed $1 per instrument now in use in this city. Attorneys estimate that there were 2,500 telephones in use at time and that the company is liable for the sum of $2,500.

TELEPHONE POLES IN NEW YORK HIGHWAY.

THE Supreme Court of New York has held that when the owner of land adjoining a highway does not own any interest in the highway and his rights as an abutting owner are not interfered with by the erection of telephone poles along the highway, he cannot maintain an action for their removal. The action was begun to compel the removal of certain telephone poles erected by the Bell Telephone Company of Buffalo in front of the plaintiff's lands. The plaintiff had no record title to the land to the center of the highway, but his property extended only to the side of the road. The title to the highway was in the Holland Land Company, which conveyed by deed to the defendant the right to erect its poles along the highway. The plaintiff, although admitting that he had no record title to the highway in front of his premises, insisted that he had acquired title thereto by adverse possession. The plaintiff had occasionally cut down the weeds growing in the highway in front of his premises, and once in seven or eight years had cultivated the land extending from the sides of the road to the abutting track, sowed crops and seeded it, and had taken off the crops from time to time and cut the grass growing there. He had not enclosed it nor interfered with anyone who traveled upon the highway clear up to his fence.

In the Supreme Court the complaint was dismissed, the court finding that the plaintiff had not acquired any adverse title to the property. Although the court said that had he been the owner of the lands to the center of the highway he would have his right of action either for damages caused by the erection of the poles and the cutting of his trees, or, perhaps, would be entitled to an injunction to compel the removal of the poles. This judgment was affirmed by the Court of Appeals.

Halleran vs. Bell Teleph. Co. of Buffalo, 64 App. Div. 41. 71 N. Y. Supp. 685. 69 N. E. 1124.

IN THE OPERATING FIELD.

INDEPENDENT TELEPHONE ASSOCIATION OF UNITED STATES TO HOLD CONVENTION AT ST LOUIS.

THE convention of the Independent Telephone Association of the United States will be held at St. Louis, September 20, 21 and 22. The headquarters of the association will be at the Inside Inn, the only hotel within the Exposition grounds. Special rates for parties attending the convention at the Inn have been secured. The sessions will be held during the mornings, thus allowing delegates and visitors ample time during the rest of the day to look over the Exposition.

SOUTH EASTERN KANSAS ASSOCIATION MEETING.

THE Southeastern Kansas Telephone Association held a very interesting and important meeting at Galena, August 15th. The principal object of the meeting was to discuss plans to put the Independent Toll Line system in the eight counties in this part of the State and the northeastern part of the Indian Territory in shape to connect with Kinloch Long Distance Telephone Co., at Joplin, Mo., and Pittsburg, Kan. Plans for better and more extended farm telephone service were also discussed.

The territory covered by this association includes Chautauqua, Elk, Wilson, Montgomery, Neosho, Labette, Crawford and Cherokee counties in Kansas and the Indian Territory lying north and east of the Arkansas River, and at the meeting on the above date the companies occupying this territory agreed to parallel their existing circuits with a sufficient number of No. 10 copper metallic circuits to enable them to connect with the Kinloch and give service to St. Louis and the east and Kansas City and the north. They also decided to establish a clearing house for the purpose of making uniform rates and adopting a system for handling the business interchanged among themselves as well as business to points outside this district.

The plans, when completed, will give the Galena-Joplin lead and zinc district, the coal district and the gas and oil district first-class Independent toll service and connect the same with the Kinloch long distance lines at the above-named points.

CONVENTIONS OF DISTRICTS 2 AND 3, OHIO INDEPENDENT TELEPHONE ASSOCIATION.

THE first business meeting of District No. 3 of the Ohio Independent Telephone Association was held at the Builders' Exchange, at Zanesville, Ohio. Sixty-five delegates were present from all over this district. District No. 3 comprises forty-seven Independent companies in the counties of Coshocton, Muskingum, Guernsey, Belmont, Noble, Monroe, Morgan, Washington, Perry, Athens, Meigs and Gallia.

J. B. Rhodes, president of the district organization, presided over the meeting, which was a purely business session and was called for the purpose of thoroughly organizing the association in this district. Several weeks ago President Rhodes sent out invitations to the officers of every telephone company in this district requesting them to be present at this meeting and assist in the work of organization.

President Rhodes during the past few months has secured a large amount of data of great interest to the various companies. In the third district there are forty-seven Independent telephone companies which have 20,000 instruments in active operation at the present time. In Morgan County alone there are 964 Independent telephones.

During the afternoon interesting addresses were made by J. B. Hoge and C. Y. McVey, of the Federal Telephone Company of Cleveland; M. B. Overley, of the United States Long Distance Company; Frank L. Beam, president of the Ohio Association and general manager of the Citizens' Telephone Company of Columbus; A. H. Doudna, Bridgeport; A. W. Kuntz, Caldwell; H. M. Smith, Carrington; A. C. Davis, Parkersburg, W. Va.; P. E. Fraley, Woodsfield; C. Kissner, Coshocton, and a number of other men prominently identfied in the telephone business.

An auxiliary committee was appointed by the president from the various counties, as follows: Coshocton, L. P. Galligher; Muskingum, B. D. Doan; Guernsey, Wm. Hoyle; Belmont, A. H. Doudna; Monroe, F. C. Hutch; Morgan, Geo. M. Scott; Washington, A. C. Davis; Athens, C. L. Jones; Perry, A. B. Allen. Delegates from Meigs, Gallia and Noble counties will be appointed later. H. W. McKee, of Cumberland, was elected permanent secretary.

About sixty representatives of the thirty odd telephone companies operating in District No. 2 held their first meeting at Canton on September 1. General reports from all present showed that the companies included in this district were in a very prosperous condition and in a position to do some aggressive work in the future. Numerous towns in the district not now having exchanges are under consideration, and in some cases construction has been commenced.

The meeting was held at Hotel McKinley and was presided over by W. F. Laubach. A temporary secretary was elected, after which some brief remarks upon the purpose of the organization were made by the vice-president. Other addresses were made by F. L. Beam, president of the state association; J. B. Hoge, Ed. L. Barber, Hon. Cyrus Huling, H. L. Beatty and by managers of various companies. An executive committee was then appointed, after which a general debate took place upon the developments of the territory, extent of systems and also relative to cases of grievances which should be reported to the executive committee.

Reports incidentally brought forth the fact that the number of Independent telephones outranks the Bell by a ratio of 8 to 1 in the district. New companies are being organized and the interest in the work on hand has grown with great rapidity, new impetus having been given by the formation of the association.

W. H. CRUMB & CO. SELL HOT SPRINGS PLANT.

THE plant of the Hot Springs Independent Telephone Company, which was owned by the well-known firm of engineers, W. H. Crumb & Co., of Chicago, was recently sold by them to a syndicate composed of J. S. Brailey, E. L. Barber and Leo M. Flesh and a party of capitalists from Hot Springs and Kansas City. This property was one of the best developed in the Southwest, and is, therefore, a first-class investment. The purchase price was private, but it is understood to fully represent the value of the property. This is said to be the eighth company that has been promoted by the Barber and Brailey syndicate, and is considered to be the best so far handled by that company.

THE MARQUETTE COUNTY TELEPHONE COMPANY'S RAPID GROWTH.

SINCE the Marquette County Telephone Company established its plant at Masillon, Ohio, a few years ago in opposition to the Bell system the number of telephones has increased wonderfully. At the time the Bell people controlled the field service was then much higher than now, which was in a large measure responsible for the limited use the general public made of the telephones. The Marquette County system had an exceptionally rapid growth, and the enterprise netted a profit on the

Digitized by Google

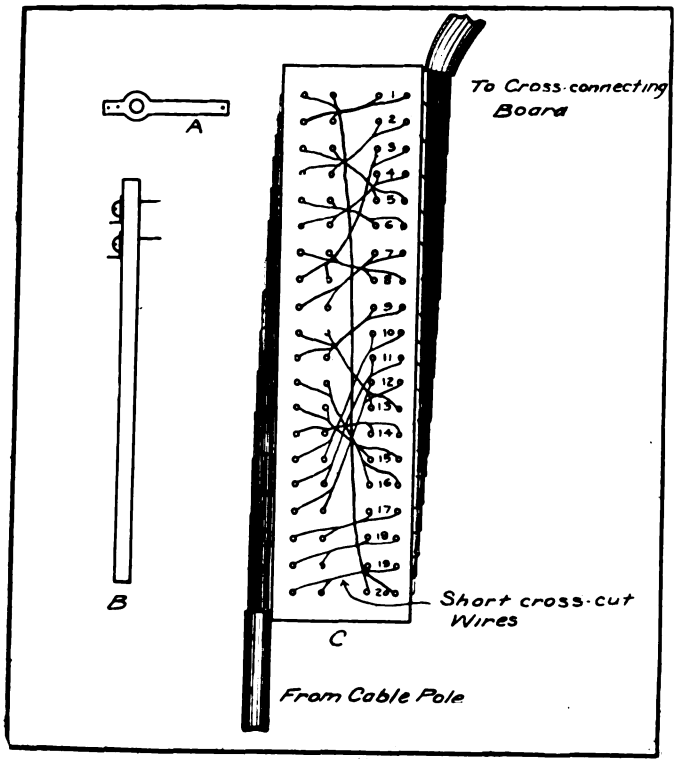
investment the first year. Annual dividends have since been declared.

There are now over 3,000 telephones in use in the county, and the list is increasing steadily.

AN INTERMEDIATE CROSS-CUT BOARD FOR CABLES.

By C. E. Nicholas.

IN cases where no slack cable has been left after the ends have been permanently fixed to allow resetting should the cable be damaged by fire or any other accident, an intermediate cross-cut board for this purpose would save a large amount of time. The idea I have in view is to place a cross-connecting board at some convenient point where all the cables can be distributed and short cables run from there to the main distributing frame. The pairs of the short cable should be tested out and connected to their respective numbers to correspond at both ends. The incoming cable could then be set up as the wires appear without testing. By means of the short cross-cut wires on the board, the



terminals of the cable poles could be made to correspond to the ones at the main frame. The general idea of the board is shown in the accompanying illustration, in which Fig. 1 shows the panel, Fig. 2 a cross-section of the board, and Fig. 3 a view of the terminal clip.

In case of an accident to the cable this panel can be cleared out while the repairs are being made outside, and the wire chief can immediately commence testing for subscribers and as fast as they are found, cross-connect them to their respective cable numbers. All spare conductors can then be connected up. In general, when a cable fault occurs affecting all the pairs, the last splice has to be made before testing can be carried out, thus a great deal of time is lost, besides causing a number of complaints which might be avoided by using some similar scheme to the one described.

SUPERINTENDENTS OF UNITED TELEPHONE COMPANY MEET AT HARRISBURG.

THE superintendents of the United Telephone Company met recently at the company's building and discussed business affairs and mechanical appliances. Later they dined at the Harrisburg Club.

There were present: Frank D. Houck, general superintendent; R. V. Page, Jr., auditor; F. Mulhausen, superintendent at West Chester; W. H. Hartman, superintendent at Lancaster; H. N. Daniel, superintendent at Sunbury; N. E. Nobb, superintendent at Bellefonte; W. P. Beardsley, superintendent at Harrisburg; J. S. Carruth, superintendent at Hagerstown, and W. Scarlett, chief engineer at Harrisburg.

A JOINT TELEPHONE DIRECTORY.

THE Citizens' Telephone and Telegraph Company, of Kenosha, Wis., announces to its subscribers and the public that its forthcoming joint directory will embrace subscribers of the Independent telephone companies of Kenosha, Racine and Bristol, also Pleasant Pairie, Winthrop Harbor, Somers, Union Grove, Paris, Brighton, Salem, New Munster, Fuller, Kansasville, Silver Lake, Spring Grove, Hickory, Millburn, Wadsworth, Lamb's Corners, Lake Villa, Gurnee, Russell, Druce Lake, Antioch, Cornice and the Kreuscher line, alphabetically arranged. A new feature will be a *Classified Business Directory* of all the Kenosha subscribers in each of the 5,000 copies to be furnished to subscribers for service and to toll patrons.

A CALIFORNIAN ILLUSTRATION.

IT often happens that a chance event changes the entire course of a man's life. In this respect it is true that there are many in the telephone business who, if it had not been for some unforeseen event, would be to-day engaged in an entirely different business. As an illustration we cite the following:

In 1901 Mr. James H. Blake, who was living at Christmas Prairie, Cal., had the misfortune to lose a son through a sudden illness. Feeling confident that if he could have secured the services of a doctor in time the boy's life might have been saved, he determined to guard against any future similar occurrence by building a telephone line to Blue Lake, a distance of fourteen miles. With only a few hundred dollars' capital he carried on the work to completion, doing a large amount of the construction work during the winter. This line had four telephones connected to it. A few months later it was extended three miles further on, and later a franchise was obtained from the county and a double metallic circuit was built to Arcata, where Mr. Blake secured a number of contracts. To-day the system has over eighty telephones in use and sixty miles of pole line, together with exchanges at Blue Lake and Arcata.

NEW L. D. LINE FOR HOME COMPANY OF DAYTON.

CONNECTIONS have now been established with Indianapolis and Richmond, Ind., by the Home Telephone Company, of Dayton, Ohio, over their long-distance wires. This new circuit enables the company to offer excellent long-distance service to all points in Indiana.

INDIANA AND OHIO INDEPENDENT COMPANIES JOINED.

THE recent construction of three toll lines between Dayton, O., and Richmond, Ind., has formed the connecting link between the Independent companies of Ohio and Indiana. This was an end much desired, as the various interests of the two States demanded an interconnection between the various Independent companies. Since the same charge is made for five minutes' conversation by Indiana Independent companies as for three minutes by the United States Telephone Company an adjustment of rates will be necessary.

P. AND A.'s NEW LINE TO WHEELING.

THE work on the Pittsburgh and Wheeling Telephone line is being rushed. At present the contractors are at Taylorstown. Here the Keeling & Ridge Company of Pittsburgh have about 100 men employed. The general impression here is that the new line is being built by the Pittsburgh & Allegheny Company of Pittsburgh. All rights of way have been secured between Bridgeville and Washington to Wheeling. The new line will pass through Claysville, West Alexander and many smaller towns. It will cross Chartiers township between Washington and Gretna, and it is understood that it will connect with Canonsburg and reach the Pittsburgh & Allegheny either at Carnegie or Mt. Lebanon.

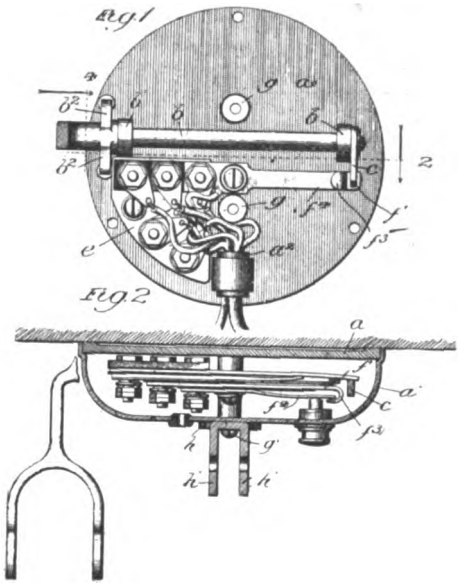
TELEPHONE PATENTS

TELEPHONE SUPPORT.

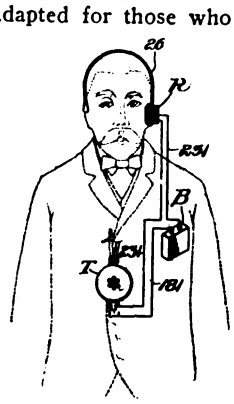
F. R. McBerty, of Evanston, Ill., patents (No. 767,489) and assigns to Western Electric Company a telephone support. This is a device for providing for an improved and compact hook-switch particularly adapted for wall instruments. There is a



base plate, *a*, to which a rocking lever, *b*, is attached. This rocking lever extends outside of the case which covers the apparatus and forms the hook-switch. The rocking lever carries a projection, *c*, which bears against the springs *f4*, which form the contacts to which the terminals of circuit are attached.

TELEPHONE TRANSMITTER.

C. W. Harper, of Malden, Mass., patents (No. 767,753). The object of this invention is to provide an improved telephonic device particularly adapted for those who are slightly deaf. It



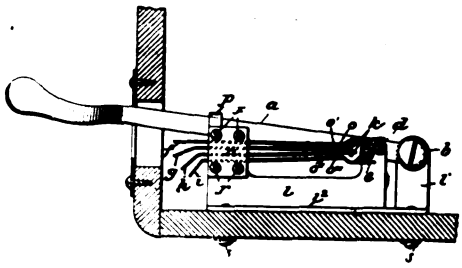
consists of a transmitter battery and receiver combined in a convenient form, as is illustrated in the accompanying diagram, to be worn by the person using. There are no particular novelties in construction.

TELEPHONE LOCKING MECHANISM.

Rudolph W. Goeb, of St. Louis, Mo., assignor to the Controller Company of America, of St. Louis, Mo., a corporation of Missouri, patents (No.766,241). In the specifications for this patent, the inventor states that locking mechanisms have been proposed for the purpose of preventing the use of a telephone until the proper coin has been deposited, and so arranged that the operator has control over the coin in such a manner as to either return it to the party calling or deposit it in a cash box, and the present patent relates to mechanisms of this class. The inventor specifically refers to patents No. 739,114, 739,075, and a previous patent granted to himself on February 13th, 1903, previously noticed in our columns. The present patent being improvements upon the various devices described in the patents mentioned, for a full comprehension of which it is necessary to refer to all of the patents. Those of our readers who are interested in this subject would do well to procure copies of the entire set for reference.

HOOK-SWITCH.

C. T. Mason, of Sumter, S. C., patents (No. 767,584) a telephone hook-switch. The object of this invention is to provide an improved hook-switch which is illustrated herewith. The



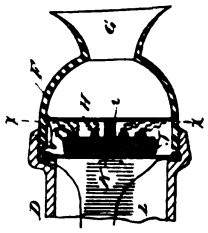
inventor provides a base plate, *l*, to which the hook-switch is pivoted at the point *b*. This plate carries a support, *n*, to which the various springs of the circuit terminals are attached. The hook-switch carries insulating rollers, *e* and *d*, which operate the springs.

APPARATUS FOR KEYS OF BRANCH EXCHANGES.

J. S. Ford, Chicago, Ill., assignor to Western Electric Company, of Chicago, Ill., patents (No. 768,039). This is an invention adapted for private branch exchanges, and essentially consists in connecting various keys together by means of sliding bars so that the movement of one key locks all the other keys which are associated therewith.

TELEPHONE TRANSMITTER.

J. W .Kurtz, San Francisco, Cal., patents (No. 768,185). The object of this invention is to provide a transmitter which is more efficient and which can be arranged to produce clearness and mellowness of tone. A sectional view is shown in the accompanying illustration, from which it will be perceived that the inventor provides two diaphragms, *K* and *H*. To the diaphragm *H* a car-



bon electrode *I* is attached, and between this carbon electrode *K* the granular carbon is placed. Electrical connection between the diaphragm *H* and the carbon electrode *I* is secured by providing a number of flexible conducting wires as shown.

INDIVIDUAL SELECTIVE SYSTEM.

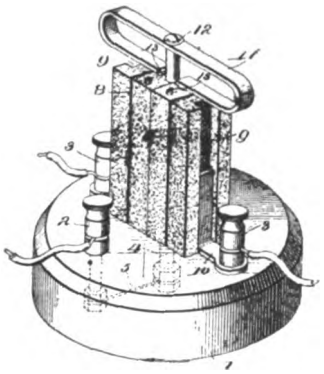
Benjamin Brooks, of Springfield, and Howard F. Metcalf, of Holyoke, Mass., patent (No. 766,806). This invention belongs to the step by step class, but is operated in a curious manner. The inventors provide an electromagnet, the armature of which carries a paul that operates a toothed wheel. Every impulse sent over the line moves the toothed wheel forward one notch. The armature of the magnet carries a prolongation which strikes against a ball and the impulse thereby given rolls the ball up an inclined plane. When the ball returns by gravity, it releases a detent and allows the toothed wheel to return by gravity to its

Digitized by Google

normal position. The toothed wheel carries a contact located at a different position upon the various wheels in the different substations. By moving the wheel with the proper number of impulses, any station may be rung and the ringing continues so long as the ball is rolling upon the inclined plane. When the ball returns it releases the toothed wheel, which returns to its normal position.

LIGHTNING ARRESTERS.

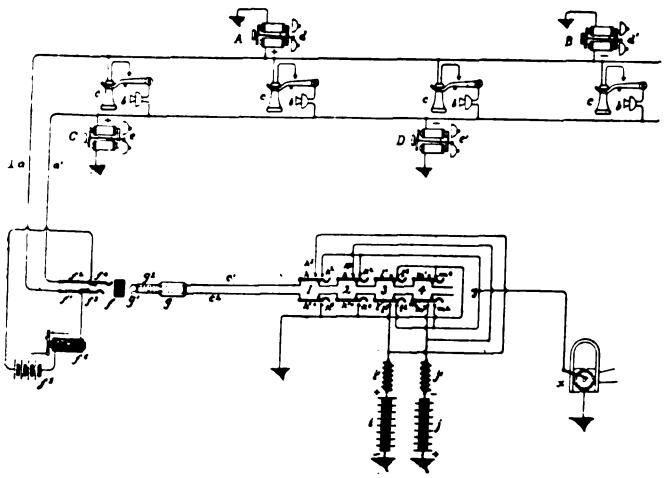
C. A. Rolfe, of Adrian, Mich., patents (No. 768,196) and assigns to the Rolfe Electric Company, of Chicago, Ill., a lightning arrester. The object of this invention is to afford an improved lightning arrester. The inventor provides an insulating base (1) upon which the binding posts (3, 3 and 2) are mounted. The



posts (3, 3) are connected to springs which secure carbon blocks mounted vertically, the carbon blocks being separated by a thin film of insulating material (8). To the center block the post (2) is connected, which goes to ground.

PARTY LINE SYSTEM.

T. C. Drake, of Malta, Ohio, patents (No. 768,272) an improved party line system. This patent relates to an improvement in party line selective signalling along the lines of a somewhat similar patent recently granted to the same inventor, which has been noticed in these columns. The circuit is conventionally shown in the accompanying illustration, from which it will be perceived that the substation apparatus includes the ordinary biased ringer legged to ground from either side of the line. At



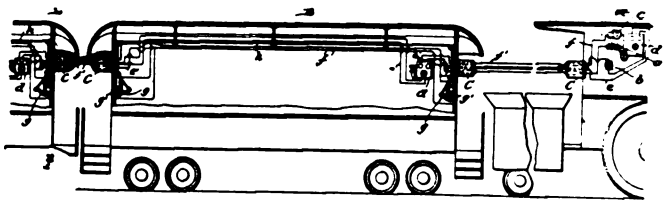
the central office a ringing generator is arranged to supply positive and negative pulsating current, which may be sent over either side of the line. In addition, two batteries are arranged so that positive current or negative current may be transmitted over the line in such a manner that the positive waves of the generator may be reinforced by positive current and negative waves by negative current. By this means the inventor secures a greater margin in ringing.

LOADED ELECTRIC CIRCUIT.

Howard S. Warren, of Everett, and George A. Campbell, of Newton, Mass., assignors to American Telephone & Telegraph Co., a corporation of New York, patent (No. 729,709). It is known that when an electric wave travels over a heterogeneous circuit, it is reflected when it passes from one portion of the circuit to another, particularly when the different portions of the circuit vary markedly in resistance, inductance or capacity. This is particularly the case at the ends of such telephonic circuits as are attached to long lines, and the object of this patent is to prevent these reflection losses; accordingly, the invention consists of localized artificial impedances or capacities which are introduced into the various sections, into which a long line may be divided in such a manner that there is no sudden change between the electrical properties of any section and the succeeding one, or in other words, at the ends of the line, the inductance or capacity is, so to speak, tapered off and so no abrupt change is made. The inventors accomplish this object by introducing the proper reactance of coils at various points in the circuit.

TELEPHONE AND SIGNAL APPARATUS FOR RAILWAY TRAINS.

B. W. Speck, of Uhrichsville, Ohio, patents (No. 768,547) a telephone and signal apparatus for railway trains. This is an invention for providing telephonic connection between the cab of a locomotive and the cars of the train which it draws. The



essential features are shown in the accompanying illustration, from which it will be perceived that a telephone set is located in each car and connected by means of a circuit extended between the cars to a set located in the locomotive. The essential features in the invention are comprised of the method of making flexible connections for the circuits between the cars.

APPARATUS FOR TRANSMITTING MESSAGES BY TELEPHONE

Edgar W. Day, of Baltimore, Md., patents (No. 766,225) apparatus for transmitting messages by telephone. The intention of this invention is to provide a means for telephonically transmitting messages. The inventor provides a phonograph, upon the record of which the syllables which compose various words are recorded. In order to transmit a message, the operator so manipulates the key which controls the motion of the phonograph in such a manner as to combine in any desired way the various syllables to form a word. For instance, supposing the record to contain the syllables com-for-ing-tion. These may be combined to form comfort, comforting, forming, and formation, and in this way words may be spelled out.

MEANS FOR INTENSIFYING TELEPHONOGRAPHIC RECORDS.

E. E. Ries, of New York, N. Y., patents (No. 768,541), a means for intensifying telephonographic records. This invention relates to an improvement in apparatus for making telephonic records of the class known by the name of telegraphones, in which a magnet attached to the diaphragm of the receiver is placed over a moving steel band and imparts magnetism to the band depending upon the vibrations made by the diaphragm. In this particular invention the inventor arranges several bands to be effected by the diaphragm magnets and then arranges the bands so that they may be superimposed one upon the other when the record is to be transmitted, and by this means expects to obtain the combined magnetic effect of the several bands.

Digitized by Google

THE WEEK'S MESSAGES

FINANCIAL.

CHICAGO, ILL.—A trust deed for $50,000,000 made by the State Independent Telephone & Telegraph Company, which has offices in Jersey City, N. J., Chicago and Aurora, Ill., to the American Trust and Savings Bank as trustee, has been filed.

GENEVA, IND.—The Geneva Telephone Company has increased its capital stock from $500 to $2,000.

INDIANAPOLIS, IND.—The July statement of the Delaware and Madison Counties' Telephone Company, Indiana, is a gratifying one to the stockholders. It compares as follows with the statement for July, 1903:

	1904.	1903.
Income from rentals	$6,336.76	$4,511.50
Income from tolls	1,258.03	827.39
Income from building	135.00	135.44
Allowances	31.18	21.40
Gross income	7.698.61	5,452.49
Operating charges, taxes and insurance	4,006.87	2,901.08
Net income	3,691.74	2,551.41
Interest	1,666.66	1,519.17
Surplus	2,025.08	1,032.24

Number of telephones in service July 1, 1904, 3,828. The company has in its territory such thriving cities as Anderson, Alexandria, Albany, Elwood and Pendleton.

ALBERT LEA, MINN.—The Albert Lea Telephone Company has decided not to sell its system to the Twin City Telephone Company, and instead to increase its capital stock to $30,000 and remodel its entire system.

EDGERTON, MINN.—The Edgerton Telephone Company, by F. W. Coon, president, and W. A. Shelley, secretary, has filed an amendment increasing its capital stock from $6,000 to $18,000.

WILLMAR, MINN.—The Minnesota Central Telephone Company of Willmar has amended its articles of incorporation extending its limit of indebtedness to $1,000,000. The company is preparing to largely extend its lines.

WINONA, MINN.—The Tri-State Telephone Company has declared its fifth quarterly dividend of one and a half per cent.

CRAIG, MO.—The Craig Telephone Company has increased its capital stock from $1,500 to $10,000.

TROTWOOD, OHIO.—The Trotwood Home Telephone Company has increased its capital stock from $10,000 to $20,000.

MEMPHIS, TENN.—The Mutual Telephone Company, of Yazoo City, reports for the quarter that its receipts have been $7,554.13, while its expenses amounted to $5.457.63. The report further adds: "May 25, 1904, the conflagration in Yazoo City destroyed about three-fourths of our system, including the exchange." The company has rebuilt two-thirds of the system.

FRANCHISES.

LOS ANGELES, CAL.—The Home Telephone Company has been granted a franchise along the Ocean Park Speedway and is to commence work at once.

ALTON, ILL.—The Fosterburg & Bethaldo Farmers' Telephone Company, which asked for a franchise to construct a system in Alton recently, has agreed to give the city two per cent. of its gross revenue and made other concessions.

KANSAS CITY, MO.—The Home Telephone Company of this city has again made application for a franchise in Argentine, a suburb of this city. It offers a free telephone as soon as the franchise is given and another as soon as 100 telephones have been installed.

AUGUSTA, ME.—The selectmen have granted the Somerset Farmers' Co-operative Telephone Company the right to construct lines along certain roads in this vicinity, and to enter town by four routes.

BREWSTER, MINN.—The Minnesota Valley Telephone and Telegraph Company has been granted a franchise by the city council.

CANASTOTA, N. Y.—The Board of Trustees has granted a franchise to the Canastota Telephone Company to operate and maintain lines in Canastota. The company will be incorporated with a probable capital stock of $25,000.

ONEIDA, N. Y.—The Board of Public Works has granted a franchise to the Rome Home Telephone Company for a toll line through the city from the east.

JENNINGS, OKLA.—M. T. Sherman, of Joplin, Mo., has received a franchise to establish a telephone system here.

WALKERVILLE, ONT.—The Ontario Independent Telephone Company has applied to the council for a franchise. The company is seeking a service in Windsor, Walkerville and Sandwich, giving connection with the co-operative company in Detroit. The Bell Company's franchise in Walkerville expires in November, and in Windsor in two years' time.

FREDERICKSBURG, VA.—The Toluca & Fredericksburg Telephone Company has secured a charter awarded the contract for furnishing and setting the poles of the telephone line, which is to extend from Toluca, in Stafford County, by Garrisonville, Stafford Courthouse, Brooke, and Boscobel, to this city.

ELECTIONS.

MONTICELLO, N. Y.—The Monticello Telephone Company has elected the following officers: C. L. McLoughlin, president; G. L. Hatch, secretary, and H. F. Holmes, treasurer. Edwin H. Strong, A. A. Crane, J. C. Taylor and Stephen Trowbridge, directors.

CALDWELL, OHIO.—The Caldwell Independent Telephone Company was reorganized with the following officers: W. H. Brown, president and general manager; A. C. Brown, vice-president; Arthur Schafer, secretary and treasurer. The capital stock will be increased from $5,000 to $50,000.

WAPAKONETA, OHIO.—At the meeting of the Independent telephone companies of this district, embracing the counties of Marion, Wyandot, Hancock, Putnam, Paulding, Van Wert, Mercer, Allen, Auglaize and Hardin, the following officers were elected: Mr. Matheny, president; D. A. Clark, of St. Marys, secretary.

BRODHEAD, WIS.—At the annual meeting of the Brodhead Telephone Company the following directors were elected: A. S. Moore and A. Broughton. The company has expended nearly $4,000 in construction work within the past year.

COMBINATIONS.

FRANCISCO, IND.—At a meeting of the directors of the Independent Telephone Company and the Farmers' Telephone Company, held here recently, arrangements were made for the consolidation of the two systems. Both of the companies now have systems here and it is now proposed to build a new building and install a new switchboard and to combine the two plants.

McLOUTH, KAS.—H. D. Edmonds has sold out his telephone exchange in this city to Sellers & Son.

BEATRICE, NEB.—The Virginia Telephone Company has purchased the Suler-Stoll line, which connects the towns of Holmesville, Beatrice and Filley.

ST. JOHN'S, N. B.—The Union Telephone Company and the Central Telephone Company, operating in New Brunswick, intend to amalgamate. The Union Company has its headquarters at Florenceville, and uses the Stranger automatic central. The Central Company operates from Belliste.

SHARON, PA.—W. H. Wilson, of Erie, general manager of the Union Telephone Company, is here arranging for the purchase of the Mercer and Lawrence County telephone lines.

PERSONAL.

SYLVESTER CECIL has been appointed manager of the Bourbon Home Telephone Company, at Paris, Ky., in place of C. Humbert, resigned.

MR. J. A. GORDON, of the International Telephone Manufacturing Company, of Chicago, has recently taken charge of the construction of the public service telephone system for the town of Neepawa, Manitoba, where the town is practically doubling its capacity by installing a large amount of additional cable and enlarged central office equipment.

G. L. STERNS has been appointed manager of the Enterprise Telephone Company at Edgerton, Minn.

J. VAN WORMER has resigned the position of manager of the Cleburne Telephone Company.

NEW COMPANY NOTES.

TORONTO, CANADA.—The Independent Telephone Company has applied for a franchise in Windsor, Walkerville and Sandwich, with a capital stock of $100,000. The incorporators are: C. W. Taylor, R. Brooks, J. A. McRae, P. T. Chestey and A. D. Prosser, all of Detroit, Mich.

Va., and others.

UNION GROVE, WIS.—The Union Grove & Paris Telephone Company has been incorporated with a capital stock of $2,000, by Henry Barns, O. P. Graham and E. E. Bartholf.

MISCELLANEOUS.

SAN DIEGO, CAL.—The Home Telephone Company has received 13,000 feet of aerial cable for its line plant.

PEORIA, ILL.—Plans for a new fireproof building for the exchange of the Interstate Independent Telephone Company have been drawn up and it is expected work will commence in a short while.

BLUFFTON, IND.—During a recent severe electrical storm every farm telephone in the county was burned out and a large number of city telephones were made inoperative.

INDIANAPOLIS, IND.—The telephone took the place of the service of orderlies at the recent camp of instruction of the Indiana National Guard at Fort Benjamin Harrison, near Indianapolis. The system was put in by the signal corps to connect the brigadier-general with the colonels, quartermaster-general and the commissary.

CLARINDA, IOWA.—The Independent Mutual Telephone Company has completed a line between here and Shenandoah.

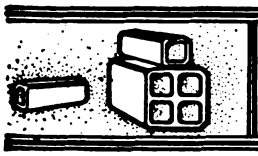
SIOUX CITY, IOWA.—The Payette Construction Company has been awarded the contract for the exchange building of the Independent company. Their bid was $19,419. The contract requires the building to be completed by December 15.

SPRINGFIELD, TENN.—Local capitalists are endeavoring to get the Home Telephone Company, of Hopkinsville, to put an exchange in this town.

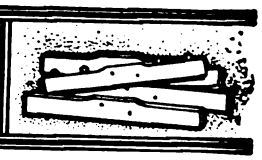
GAINESVILLE, TEX.—The latest issue of the People's Home Telephone Company, which operates systems at Denton, Valley View and this city shows a marked increase in subscribers over the last issue.

UNDERGROUND.

COVINGTON, KY.—The Citizens Telephone Company has obtained permission to build conduit and lay its wires in the business section underground. Work will be commenced at once.



New Construction in the Field



FAIRHOPE, ALA.—The Fairhope telephone system is now in course of construction.

WETHERSFIELD, CONN.—A telephone company is planning new arrangements for the system through this place, making Wethersfield the center of a new circuit connecting Rocky Hill, Griswoldville and Newington.

DE LAND, FLA.—The De Land Telephone Company will extend its lines to Beresford.

DIXON, ILL.—The Lee County Telephone Company will spend about $75,000 in this city in rebuilding its system. The new plans will include a new subway system.

MT. CARROLL, ILL.—The Ronk-Spiker Telephone Company has ordered a new 200-drop switchboard and will install it in the larger office it has secured.

FAIRFIELD, ME.—The Farmer's Co-operative Telephone Company is extending its lines into this town.

CHARLTON, MASS.—Work will be commenced at once on the construction of the farmers' telephone lines in Charlton.

FALL RIVER, MASS.—Committees have been appointed by the Fall River and New Bedford Automatic Telephone companies to formulate a consolidation plan and make preparations to extend the system in Taunton and Brockton.

OVID, MICH.—The Union Independent Telephone Company have completed work in Ovid and vicinity for the present. They have installed twenty-five new rural telephones and added twenty new drops to the board in their exchange. A 100-pair cable has been brought into the office, giving it the present capacity of 275 subscribers. Among the general office improvements is a new cross-connection rack. The force is now at work establishing an exchange at Pewamo.

TRAVERSE CITY, MICH.—The Citizens' Telephone Company are making extensive enlargements to their switchboard, line plant and underground conduit system.

BELVIEW, MINN.—The Redwood County Rural Telephone Company will put in a local exchange.

LAKE ELMO, MINN.—The building of a rural telephone system is under contemplation.

STAPLES, MINN.—The Hewitt-Wrightstown Telephone line will be extended from this place to Verndale.

WELCOME, MINN.—The Armstrong Telephone Company is establishing a local exchange here with fifty-four telephones.

KIMBALL, NEB.—B. A. Lathrop, of Sidney, manager of the Independent Telephone Company, is preparing for the installation of a new system in this city.

STRATTON, NEB.—Workmen are busy putting in a new telephone exchange at this point.

WOODSTOWN, N. J.—The Philadelphia *Inquirer* states that prospects are bright for an opposition telephone company at Woodston, in connection with a rural line to give service to farmers.

WOODSTOCK, N. B.—The Union Telephone Company has extended its system from here to Hawkshaw and Canterbury. The line is a metallic circuit.

CLIFTON SPRINGS, N. Y.—The Clifton Springs & Phelps Telephone Company is putting in a new cable and making other improvements to its system.

WELDON, N. C.—F. C. Toepleman, general manager of the Home Telephone Company, is making preparations to install a new switchboard in Weldon, rebuilding all the lines, using cables, and generally reconstructing its system.

HOBART, OKLA.—The Chickasha-Altus Telephone Company will extend its lines to this city through Mangum and other points.

FORT FRANCES, ONT.—The International Telephone Company, composed of local men, has been formed and is at work putting in an Independent telephone service for the town.

ALBANY, ORE.—The Independent Telephone Company will construct an exchange in Albany.

INDEPENDENCE, ORE.—The city council has granted the Independent telephone lines in this vicinity the privilege to construct lines through the streets of the city.

LEWISBURG, PA.—The United Telephone and Telegraph Company is improving its system at Lewisburg and other places in the county by installing new switchboards and line equipment.

POTTSTOWN, PA.—Dr. Thomas J. B. Rhoads has been elected president of a new telephone company organized here to construct a line from Pottstown to Birdsboro. It will connect at Reading with the Consolidated Telephone Company.

COLUMBIA, TENN.—The Citizens' Telephone Company has let a contract for a new line to run from Bear Creek to Lasca. The line will be run later to Harrison's Mill and Rally Hill.

GRANDBURY, TEX.—Juliff & Cogsdell have purchased the entire exchange of the Grandbury Telephone Company.

VICTORIA, TEX.—A telephone line will be constructed between Victoria and Mission Valley. The secretary of the Business Men's League can give information.

AGITATION FOR INDEPENDENT SYSTEM IN MILWAUKEE.

INDEPENDENT telephone men are again agitating the question of a Milwaukee connection, and it is said that the managers of the Independent telephone companies of the State will hold a meeting in La Crosse or Madison in the near future to discuss the question.

TRADE NOTES

J. FRANK BUTTERFIELD, of Chicago, has secured the contract for all construction work and extensions to the plant of the Rushville Co-operatice Company, Rushville, Ind.

THE S. H. COUCH COMPANY, of Boston, Mass., reports large sales of its toll line switchboard. Descriptive matter of this or any other apparatus will be sent to interested parties upon application.

J. W. MIDDLETON & COMPANY, 167 Dearborn street, Chicago, Ill., are distributing a very neat embossed desk calendar and samples of their work on stock certificates and bonds. This company will be pleased to furnish estimates at any time for as many certificates or bonds as may be wanted. Being specialists they are in a position to handle all business of this nature in a most satisfactory manner.

THE CONTROLLER COMPANY OF AMERICA, 1061 Monadnock Block, Chicago, is showing at its exhibit in section 19 of the Electricity Building at the World's Fair, a coin device for the Automatic telephone. This, being the first practical device for this service, is attracting considerable attention. The device is shown attached to an automatic telephone connected with the system working in the Palace of Electricity.

THE INTERNATIONAL TELEPHONE MANUFACTURING COMPANY, Chicago, it is reported, that for this time of the year is having an exceptionally good demand for its small village exchange and rural country party line apparatus, having recently secured outside of its regular trade, contracts for equipment for Holdredge, Neb.; South McAllester, I. T.; Fayetteville, Winamac and Grass Creek, Ind.; Pierre, S. D.; Svea, Minn.; Malvern and Tabor, Ia.; Baldwin, Kans.; Devine, Tex., and Hartland, N. B.

THE FAHNESTOCK TRANSMITTER COMPANY, 132 Havemeyer street, Brooklyn, N. Y., is sending out a novelty in the line of private mailing cards. On the back of the card is pictured a dry cell and to the carbon electrode is fastened a sample of the spring binding post this company manufactures. This binding post possesses many features of interest, such as security without the use of a screw, ability to grip any size wire, rapid in operation and simple. To all parties interested this card will be mailed on request.

THE F. BISSELL COMPANY, of Toledo, Ohio, is issuing several new folders which deal with apparatus and supplies it handles. Amongst others are circulars describing "Security" pole distributing boxes and "Security" trolleys for stringing cables; Mathias Klein & Sons' tools, of which it carries a full line in stock, also price list of "Baird" pay stations, peg counters, instruction card holders, time stamps for toll tickets, toll tickets, and time stamps for business uses. Any or all of these circulars will be mailed upon request.

FRANK B. COOE, of 238 W. Lake street, Chicago, reports the following large exchanges which have used his No. 44 Protector: The Citizens' Telephone Company, of Grand Rapids, Mich., equipped for 5,425 pairs; Home Telephone Company, of Dayton, O., equipped for 6,000 pairs; Northeastern Telephone Company, of Portland, Me., 2,500 pairs; the Home Telephone Company, of Kansas City, Mo., 2,060 pairs in exchange A, 1,440 pairs in exchange B, and 1,640 pairs in exchange C; Utah Independent Telephone Company, of Salt Lake City, 4,100 pairs.

STERLING ELECTRIC COMPANY. Lafayette, Ind., reports an unusual activity in its standard protective devices, having recently installed equipment for the following places: New York city; Savannah, Ga.; Findlay, Ohio; Jackson, Ohio; Crosswell, Ohio; Newall, Ohio; Aurelia, Ohio; Papillion, Neb.; Hazelton, Pa.; Reading, Pa.; Norwalk, Ohio; San Marcos, Tex.; Springville, N. Y.; Winchester, Ind.; Tampa, Fla.; Boston, Mass.; Sidney, Ohio; Union, Mo.; Westfield, Pa.; Sherman, Pa.; Rochester, Ind.; Defiance, Ohio; St. Johnsbury, Vt.; Comer, Ga.; Oxford, Ohio; Clarion, Iowa; Deposit, N. Y.; Wells, Minn.; Zion City, Ill.; Lincoln, Neb.; Portland, Me.; Cleburne, Tex.; Topeka, Kas.; Swedesboro, N. Y.; Greencastle, Ind.; Fulton, Mo.; Herkimer, N. Y.; Hudson, N. Y.; Clinton, Iowa.; Blairsville, Pa.; Angola, Ind., and Suffolk, Va.

THE LEEDS & NORTHRUP CO., 259 N. Broad street, Philadelphia, has issued a very interesting catalogue describing the electrical measuring instruments on view at the exhibit of the National Bureau of Standards at the St. Louis Exposition. These instruments were specially loaned to the Bureau to assist in calibrating and standardizing instruments for the Jury of Awards. Among the various pieces of apparatus illustrated are Wheatstone Bridges of the most improved pattern, standard resistance coils, the Carey-Foster Bridge, the Kohlrausch Slide Wire Bridge, Potentometers, D'Arsonval Galvanometers, High-Grade Keys, Standard Condensers, Standards of Self-Induction and the Rosa Curve Tracer, together with prices and thorough descriptions of the instruments. The company also has for distribution to parties interested a catalogue of ninety-two pages, which describes very thoroughly all its instruments for electrical testing, and nine pamphlets, viz.: No. 1, Resistance Boxes; No. 2, Potentiometers; No. 3, Moving Coil Galvanometers; No. 4, Standard Resistances; No. 5, Portable Testing Sets; No. 7, High-Grade Keys; No. 8, Self-Induction Apparatus; No. 9, Carey-Foster Bridge; No. 10, Hooper Conductivity Bridge.

THE BAIRD MANUFACTURING COMPANY, of Chicago, last week received the following letters:

Gentlemen:—Enclosed find check as payment in full for three pay-stations received. Please send us at once by express one more just like these three. They work O. K. ROYAL TELEPHONE CO., Milford, Ind.

Gentlemen:—Please send by express three new model pay-stations for Canadian coins. Those we obtained from you a short time ago are working admirably. THE MIRIMICHI TELEPHONE CO., Chatham, N. B., Canada.

Gentlemen:—We enclose check to pay for the No. 13 pay station. It is a good one. NEW PINEVILLE TELEPHONE CO., Pineville, Ky.

THE DOUBLEDAY-HILL ELECTRIC COMPANY, Pittsburg, Pa., is sending out a reply postal card which is intended to interest the buyer of telephone material. On the sending half it sets forth the advantages this firm has in the way of extent and variety of stock, and also states the fact that price is the only incidental when the quality of the goods is considered. On the reply half is printed a form for buying, which includes space for shipping directions and also an inquiry space for price on any article desired. The Doubleday-Hill Company would be pleased to hear from all persons interested.

The 1900 Dry Battery

THE most needed quality is reliability. No one wants a battery that will respond all right for a week or ten days then "suddenly go out of business." Another requirement is that it shall continue "strong" during its life. These two requirements besides many others are characteristics of

1900 BATTERIES

We guarantee them not to freeze, leak or break; we warrant them to work with a strong, steady current during their life (anywhere from six to eighteen months).

They are compact, always ready. They are better than wet batteries—no slop, no repairs, no breakage. Any one can replace a worn out one at a moment's notice. They can be carried anywhere—always ready for instant use.

Telephone Service for the City of Toronto.
Sealed offers will be received up to noon on
Saturday, October 1st, 1904,
for the installation and operation of a telephone business or service in the City of Toronto, upon terms and conditions which may be obtained from the City Clerk, City Hall, Toronto.
Each offer must be accompanied by a cash deposit, or a marked cheque payable to the order of the City Treasurer, for the sum of $5,000 00.
Any party failing to execute the necessary contracts to carry out his offer in accordance with the terms and conditions of the specifications will forfeit his deposit to the City.
Offers must be addressed to Thomas Urquhart (Mayor), Chairman of the Board of Control, and sent in through registered post.
The City does not bind itself to accept any tender.
THOMAS URQUHART (Mayor),
Chairman Board of Control.
City Hall,
Toronto, Aug. 20th, 1904.

We Make a Specialty of Telephone Poles.

Bituminized Fiber Conduit
For Underground Construction

Combines the **good features** of other conduits. **Eliminates** the **bad features** existing in many kinds. **Has valuable features** not found in any other ducts. :: ::
Made in 7-foot lengths with male and female joints, making construction very rapid and simple, with consequent low cost. :: :: ::
Alignment is perfect and permanent without tedious care and skill required in laying of butt-joint conduits. Users are astonished by the ease and rapidity with which cables can be drawn in, and this without the slightest scratching or injury to the lead covering thereof. Made in sizes from 1-inch to 10-inch diameter. ::
Bends of any radius and any angle. :: ::
Write us for further information and prices, stating sizes and quantities required. :: :: ::

ERICSSON RURAL LINE SYSTEM

A very simple system for all Farmer and Rural Lines, by which the subscriber calls at will any other subscriber on the same line without calling central: calls central at will without calling any other subscriber. This system pleases the subscribers, saves much time to the operator, and makes the service entirely satisfactory. Ask for particulars. You will want it. We manufacture a great variety of Telephones, Switch-Boards and Specialties. Ask for catalogue M and our laughter-provoking novelty.

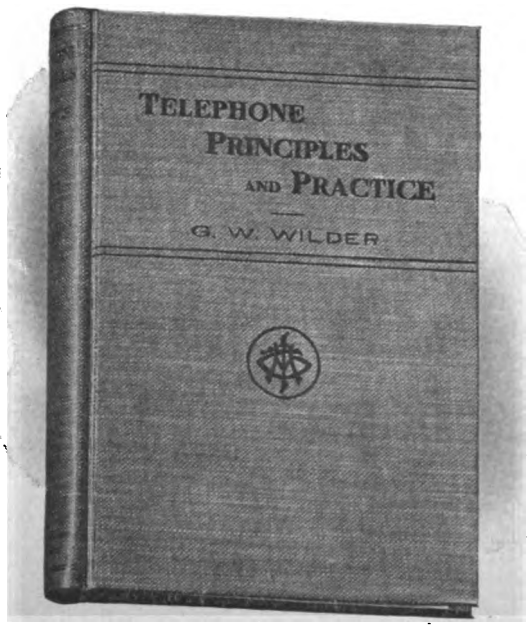
THE NEW TELEPHONE BOOK

BY

G. W. WILDER, Ph.D., Professor in Telephony

ARMOUR INSTITUTE OF TECHNOLOGY



This book is strictly up to date and complete in every respect. It deals with all of the ins and outs of telephone apparatus. Profusely illustrated with drawings and half tones. Instruments, switchboard and cord circuits with detailed descriptions, enable anyone to thoroughly understand all the problems met with in telephone practice.

CONTENTS

CHAPTER.		CHAPTER.	
I.	Magnetic Action.	XVI.	Instruments and Instrument Circuits.
II.	The Centimeter-Gram-Second System.	XVII.	Party Lines.
III.	The Electric Current and Magnetism.	XVIII.	Exchange Systems.
IV.	The Solenoid.	XIX.	Switchboard Circuits.
V.	The Production of an Electrical Pressure.	XX.	Switchboard Details.
VI.	Sound.	XXI.	Complete Switchboards.
VII.	Early Forms of Telephony	XXII.	Capacity.
VIII.	The Telephone Receiver.	XXIII.	Common Battery Systems
IX.	The Transmitter.	XXIV.	Selective Party Lines.
X.	Induction.	XXV.	Location of Exchanges and Pole Lines.
XI.	The Induction Coil.	XXVI.	Poles.
XII.	The Magneto Generator.	XXVII.	Wire.

Know Electricity

It is the most valuable knowledge a man in the mechanical or kindred fields can possess. Every reader of The American Telephone Journal knows the value of practical applied electricity.

Half-Price Special Advance Offer

There is now on the press the latest, simplest, most comprehensive and most practical Manual of Electricity ever published, the

Cyclopedia of Applied Electricity

A Practical Guide for Mechanics, Electricians, Engineering Students and All Persons Interested in Electricity

Five Volumes—2500 Pages—size of page 8x10 inches. Handsomely and durably bound in buckram, profusely illustrated with over 2000 full page plates, diagrams, plans, sections, tables, formulae, etc. Invaluable alike to the expert electrician and the apprentice. Thousands of dollars and years of preparation have been required to compile the material for this work. Every section written by an acknowledged authority. Prepared especially for practical every-day use. Combines the best features of a text-book and a reference work, as every volume is supplemented with a carefully prepared list of test questions to impress the important points upon the reader's mind. A ready reference work for the experienced workman who has no knowledge of higher mathematics, as it is free from abstract theory and difficult mathematics.

$2.50 Paid Now secures this $25.00 Cyclopedia for just half price—$12.50—a $25.00 set of books for $12.50, delivered, express prepaid. The regular price of the Cyclopedia of Applied Electricity is $25.00.

We are printing an edition for our own use. To secure immediately a sufficient number of orders to warrant our increasing the edition, and thus reduce the cost of manufacture to us, we will distribute 1000 extra sets at the reduced cost of manufacture **while they last.** We do this to introduce the work, knowing that it will greatly increase the regular sale. This offer is made for **immediate** acceptance. Reservations must be made now.

The full set of five volumes will be delivered to you as soon as it is off the press. Cut out the coupon below and mail to us. No further payment need be made until November 1st, when payment of balance at the rate of $2.00 per month must begin. **Order immediately** to insure yourself this valuable reference work at half price.

ORDER NOW—Orders will be entered as received, and positively no sets will be sold at half price after the edition now at press has been subscribed. If you are not in time for a set your $2.50 will be returned to you.

Some of the Writers

PROF. F. B. CROCKER, head of Department of Electrical Engineering, **Columbia University:** author of the sections on Storage Batteries and Management of Dynamo-Electric Machinery.

PROF WILLIAM ESTY, head of the Department of Electrical Engineering, **Lehigh University:** author of the section on Alternating Current Machinery.

H. C. CUSHING, Jr., Wiring Expert and Consulting Engineer: author of the section on Wiring for Light and Power.

PROF. DUGALD C. JACKSON, Collaborator with **PROF. GEORGE C. SHAAD, University of Wisconsin:** author of sections on Power Transmission, Electric Lighting and Central Stations.

J. R. CRAVATH, Western Editor of the **Street Railway Journal,** author of the section on Street Railways.

PROF. LOUIS DERR, Mass. Institute of Technology; WILLIAM BOYRER, Telephone Expert and Consulting Engineer.

CHAS. THOM, Chief of **Quadruplex Department Western Union Telegraph Co.,** author of section on Telegraphy, and others.

Partial Table of Contents

PART I.—Static and Dynamic Electricity—Primary Batteries—Ohm's Law—Wire Calculations—Electrical Measurements—Wiring for Light and Power—Electric Telegraph, including the Duplex and Quadruplex.

PART II.—Theory of Dynamo-Electric Machinery—Design and Construction of Dynamos and Motors—Types of Machines—Storage Batteries, including Theory, Management and Types.

PART III.—Incandescent and Arc Lighting—Electric Railways, including Car Wiring, Line Construction, Third Rail and Multiple Unit Systems—Management of Dynamo Electric Machinery—Central Station Work, including Boilers, Engines and Electrical Machinery.

PART IV—Theory of Alternating Currents—Construction, Types and Operation of Alternators, Transformers, Induction Motors, Synchronous Motors and Rotary Converters.

PART V.—The Telephone—Instruments—Line Construction—Switchboards—Exchanges—Operation and Maintenance.

VOLUME 10 SATURDAY, SEPTEMBER 17, 1904 NUMBER 12

THE UTAH INDEPENDENT TELEPHONE COMPANY'S EXCHANGE

By Edward A. Tyler.

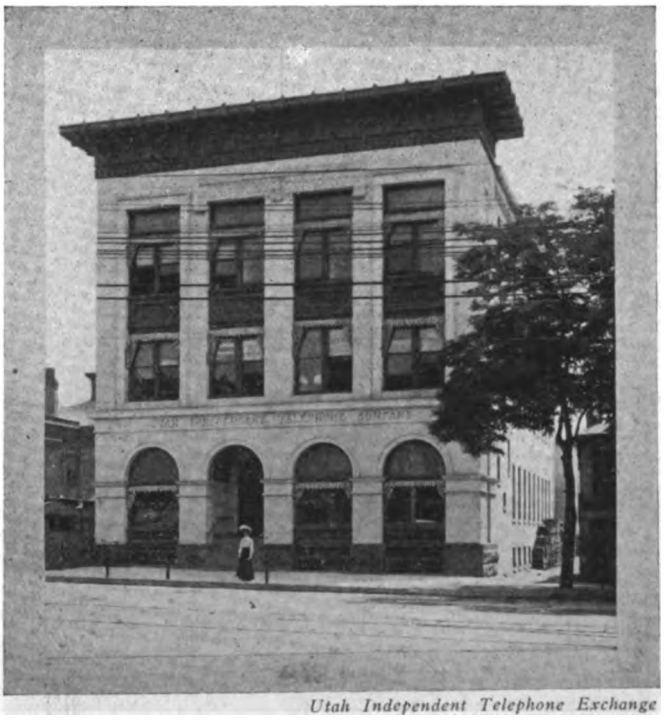
THE Utah Independent Telephone Company was organized in April, 1903, to operate under a franchise granted the preceding December. Its authorized capital stock was $1,000,000, divided into shares of $1 each. All the stock has been issued. No bonds have been issued, although a bond issue of $1,500,000 is authorized under the charter. The conditions of the franchise were 40 free telephones and 1 per cent. of the gross receipts, and its duration 50 years. The officers of the company represent some of the most influential men in the State, and are as follows: Governor Heber M. Wells, president; S. F. Fenton, vice-president; E. L. Sloan, secretary; Hal W. Brown, treasurer; Elmer B. Jones, managing director and counsel. The directors are: Governor Heber M. Wells, Elmer B. Jones, S. F. Fenton, M. H. Walker, E. L. Sloan, John Henry Smith, Geo. T. Odell, N. W. Clayton, Hal W. Brown.

Elmer B. Jones, Managing Director

Contracts for the construction of the entire plant were let to the Stromberg-Carlson Telephone Mfg. Co. Construction was started under the direction of Frank M. Hall, as chief engineer, as soon as possible after the various contracts were awarded and every possible effort put forth to complete the work in the shortest possible time.

Subway construction was begun on August 10, 1903, and completed February 1, 1904, during which time 25,582 lineal feet of subway was built, necessitating 256,963 feet of vitrified single duct tile. During construction difficulties were encountered which severely tried the patience and resources of the engineers. As is well known to many, Salt Lake City lies in a sort of basin presumed to be at one time the bed of a great inland sea, consequently delving into the earth reveals many strange phenomena. In places, excavations as deep as twelve feet revealed alkali dust, while quicksand was a common enemy. Subterranean streams whose existence no one was aware of were frequently encountered. The city is surrounded by the towering snow-capped mountains of the Wasatch and Oquirrah Ranges, and the flow of water is continuous through the Salt Lake Valley. Every method known to engineering was used in prosecuting the work. Where pavements were encountered, lying as they do on a foundation of concrete, a steam drill operated from a portable boiler was used to loosen the concrete, and other up-to-date methods were utilized to hasten the work.

On January 19, 1904, the pulling in of the underground cables commenced, and by June 1, the date of completion, 122,812 feet of cable had been drawn in and spliced. The cables were principally of 100, 150 and 200 pairs, although some 50 and 75 pair cables were used where the demands for service would not be very heavy.



Utah Independent Telephone Exchange

From the very beginning every possible effort was made to facilitate and expedite the work, and with that end in view it was decided to use in place of the old method of cable pulling by hand a 6½-h.-p. gasoline engine hoist. A ⅜-inch flexible steel rope served as a reliable, safe and easily handled cable rope. When in operation the engineer wound 2 or 3 turns of the rope around the drum and kept the slack taken up; at the proper signal when it was necessary to stop pulling, the engineer stopped drawing the slack against the drum and the cable stopped, the drum being allowed to revolve. No trouble at all was experienced in han-

Digitized by Google

Toll Room. *Contract and City Department.* *Store Room.* *Operators' Lockers.*

dling it in this manner. The cable crew, with exception of the foreman, were new men taken from the subway gang for the purpose. On January 21, two days after the work commenced, it was decided to ascertain just what could be done under the ordinary conditions met with in cable pulling. For the next 8½ days a careful record was kept by Mr. Hall with the following results:

January 27, the day on which the largest amount of cable was drawn in, the hoist was operated at three different manholes, and the crew which handled the reels, set up at four different manholes. The weather was the most severe of the winter, there being 18 inches of snow on the ground. The best previous record was 7,556 feet of 100 and 120 pair cables installed in 8½ hours by a foreman and 9 men in 1898. No preparations were made before the time of starting other than having some of the cable reels delivered at the point nearest the manholes into which the cables were to be drawn. Each reel had the batting removed, pulling wire attached, and was rolled into position to be mounted on the jacks as fast as the cable was drawn in. The sections between manholes averaged 403 ft. each, and the average time consumed in drawing in was about 6 minutes per section from the time the pulling line was attached until cable was drawn into position. The fastest time made was 4 minutes and 49 seconds. The cable drawn was in every case complete with the pulling wires removed and ready to turn over the joiners.

The Main Switchboard.

The following daily reports give the number of feet and size of cables installed in 8½ days, and will no doubht be quite interesting to construction men, as it shows a departure from the old methods used, in which pulling in from 2,000 to 3,000 feet was considered a good average day's work.

Date.	100 Prs.	200 Prs.	Total Ft.	No. Men.	Time.

Total	3770′ 3″	60496′ 3″	64266′ 6″	"	" "

Mr. Hall feels quite confident that with all conditions favorable and a reduction in the number of moves of the pulling apparatus, 18,000 feet can be installed in eight hours with a similar outfit to that which the Stromberg-Carlson Company is provided with. In the instances mentioned there was everything to contend with, so that it is reasonable to suppose that with an experienced crew even better time could be made.

Aerial cable construction was commenced on December 20, 1903, and completed May 15, 1904. During that time 4,325 poles were set, ranging from 35 ft. to 85 ft., Idaho and Oregon selected cedar being used exclusively. Salt Lake City streets being laid out at exact right angles to each other it was possible to devise a symmetrical system. The Great Mormon Temple being the geographical center of the city, the telephone center is somewhat of the same character, accordingly the aerial and underground lines were somewhat easy to design compared to cities where the streets are not laid out in squares.

In all streets running east and west and some north and south in the center of the city, conduits are constructed, and on streets running north and south poles are erected. The poles are located about 100 feet apart, just outside of the trees which line both sides of the streets. These trees grow to immense height, but fortunately have very little spread. Standing at the head of any street away from the main business thoroughfares, they appear like a solid green wall. A 7/16 S. M. steel messenger wire carries the cables, which are fastened rigidly to it, giving the whole installation a most substantial appearance. At frequent intervals along each cable line 10 or 25 pair cables are tapped off and led into hall pole tops, which are enclosed in a galvanized iron can. This contains the fuses and terminals. A galvanized iron distributing ring encircling the pole enables the subscribers' lines to be brought to the pole in a neat manner. No. 14 hard-drawn copper wire, 5/32 rubber weather-proof braid, and twisted of the best quality is used exclusively from the distributing poles to the subscribers, the connection being made inside of the building. *Not one inch* of bare wire has been used in the construction of the plant with the exception of the toll lines.

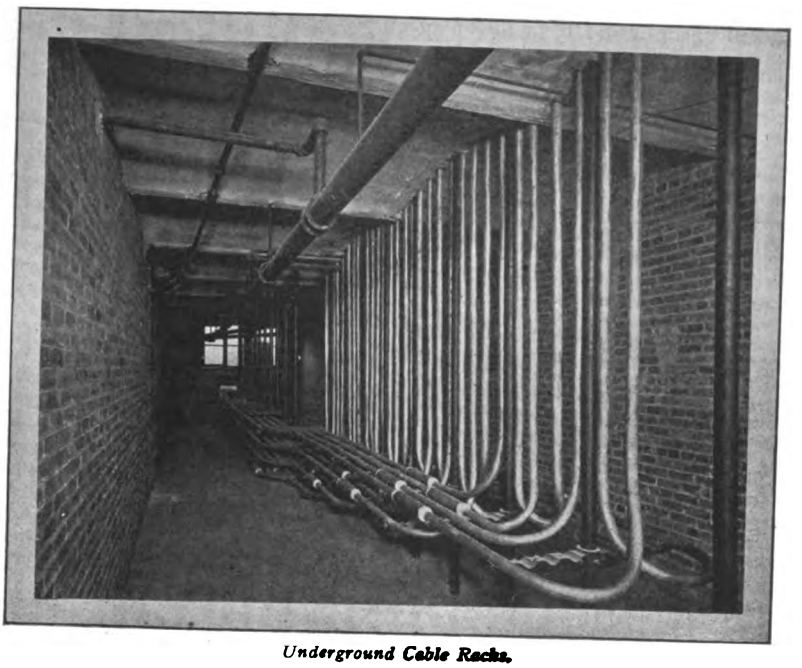
In connection with the aerial plant the following figures may be of interest. There are 1,063 terminal poles and 316,363 feet of aerial cable, ranging in size from 25 to 100 pairs. The aver-

Digitized by Google

age number of feet strung per working day was 4,400. Total number of taps and splices, 1,594.

Installing the instruments was commenced on May 9, and by August 15, 1,597 had been connected, five private branch exchanges equipped and 17 buiildings wired complete. This was done with a force of six wiremen and three helpers.

The company desired individuality in the matter of the telephones used, and to that end the Stromberg-Carlson Co. designed a special type of black Flemish oak instrument, which is a model of up-to-date telephone apparatus. The several well-known and highly commendable features characteristic of the Stromberg-Carlson apparatus have been retained, especially the circuits and the new transmitter and receiver, with the result that the transmission and operation has already excited the admiration of all users of the instruments. It is so far superior to anything ever experienced before in Salt Lake City that it is a revelation to every one, and will do more to popularize the new instruments than anything ever anticipated.



Underground Cable Racks.

On June 15, 1903, plans were approved for the exchange building, and the contract awarded June 26. Building commenced on July 1, 1903, and was completed on January 1, 1904. The construction throughout is fireproof, expanded metal partitions, steel window frames and casings, fireproof glass, and maple floorings laid on cement being used.

The entrance to the building is through a handsomely designed vestibule, brilliantly lighted by several antique combination gas and electric fixtures of wrought iron. The walls are paneled with marble and the floor is a very beautiful mosaic design. To the left is the office of the Contract and City Department, which is tastefully furnished in mahogany. A handsome bank railing and cashier's desk divides the room and affords callers a ready means of securing information regarding the various departments or liquidating their accounts. In this office is located the Contracting Department as well as the Directory Department, also furnished in mahogany.

Across the vestibule is the public toll room. This is a reception room for the use of the public who desire to call at the Exchange for any purpose. Installed at one end are two booths, in which are located public station telephones. Easy chairs, reading matter and a general air of comfort, make the moments pass quickly when it is necessary to wait for a party.

Between this room and the next room to the west, known as the Toll Room, three plate-glass swing windows have been inserted, which permit parties who wish to make out-of-town calls to give their instructions directly to the recording operator at the toll board.

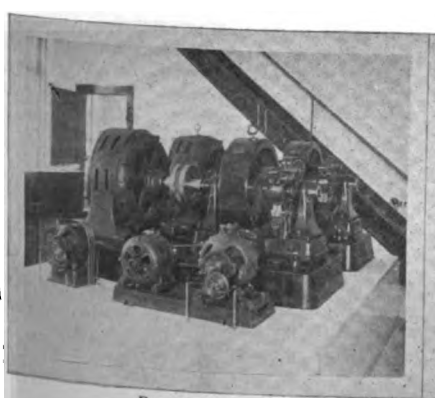
The Toll Room is located in the southeast corner of the building and contains a four-position relay bridged multiple toll board, constructed of highly polished golden oak, with ultimate capacity of 100 toll lines and 40 trunks to the main switchboard in the third floor.

The present equipment for the immediate operation consists of 30 toll lines, 20 outgoing trunk lines multipled and 20 incoming trunk lines. Each position is of the 4-panel type. Calculagraphs are installed in each section of the board. Each keyboard is equipped with 10 pairs of cords and plugs, with associated double ringing and listening keys and double supervisory signals, selector keys, clearing-out drops, etc.

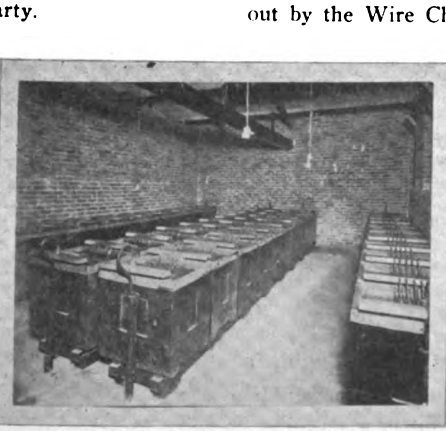
An elaborate system of toll lines and exchanges is outlined for Utah, and considerable work has already been done along this line. At Ogden, Utah, an exchange is being constructed which is an exact duplicate of the Salt Lake City Exchange, except in size, it being built but for 3,600-line capacity, and will be opened about Aug. 1. A substantially built toll line of a capacity of 40 No. 10 copper lines is already built between Salt Lake City and Ogden with 10 pairs of wires strung the entire distance.

At Murray, Utah, seven miles from Salt Lake City, a Central Energy lamp line signal exchange is under construction, and will be opened within a few days. A first-class copper construction toll line is already built past Murray, and several miles south of that point. Franchises have been secured at Bountiful, Kaysville, Farmington, Provo and in all the prinicpal cities and towns of Utah, and work is proceeding as rapidly as possible. Sixteen exchanges will be built in Utah in the next few months, together with toll lines connecting them together, thus supplying a very complete Independent system.

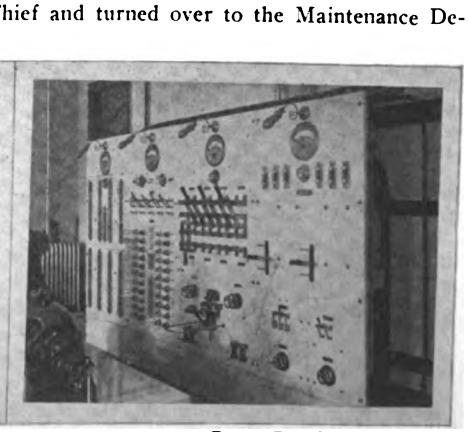
The offices of the Engineering Department are situated on the first floor, and include the office of the Superintendent of Construction and of the Superintendent of Equipment and Maintenance. All the records of the various lines and instruments are kept here, and the orders for all the work done by the employees of the departments, including the trouble which has been tested out by the Wire Chief and turned over to the Maintenance De-



Power Apparatus.



Storage Battery Plant.



Power Board.

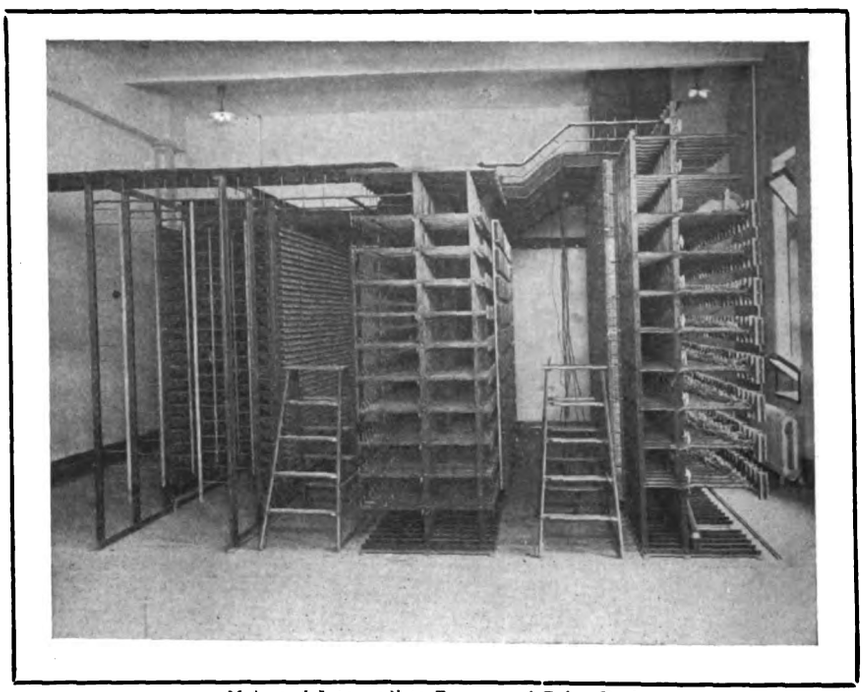
Digitized by Google

partment for their further attention, are issued from this office.

The large stock room is situated to the rear, and contains the various instruments and supplies, and the many different articles necessary for the equipment of an exchange. Underneath is a large store room, which is reached by a short flight of iron steps, and a large freight elevator, capable of handling many tons of freight, and is used for storing cable material and other heavy stock. Two sides of the room are occupied by a number of commodious lockers for the installers and other employees. Adjacent to this room and opening into it is the boiler room, in which is installed a 25-h.-p. boiler for heating the building. An auxiliary heater, to be used during the summer, is also provided. A dust-proof air-tight brick room is used for coal storage and has a capacity for several tons.

Besides the large store room the basement contains the storage battery room, which is adequately provided with facilities for carrying off the gases generated by the battery, a special brick flue being used for the purpose.

The battery is arranged in two sets, each set consisting of 20 cells of type G-23 accumulators in lead-lined tanks, having an ultimate capacity sufficient to operate the 12,600 lines for a period of 24 hours without recharging. The duplicating of the plant insures continuous service and is well worthy of emulation by other telephone companies.



Main and Intermediate Frames and Relay Racks.

Adjoining the battery room is the cable terminal room. The cables entering from the street are supported on iron racks, supported on steel posts extending the entire length of the room and running from floor to ceiling. There are 60 ducts entering, which permit of 24,000 lines being accommodated. The cables are separated from each other the same distance through their entire length. Before being turned up to enter their respective openings in the floor of the Wire Chief's room, a wool cable is spliced to the underground which leads to its respective group. The entire arrangement of the cables is most practical and reflects great credit on the designers.

Where the lightning and power wires enter the basement from a special conduit there is a white Italian marble panel, equipped with everything necessary in the line of switches, fuses, lightning arresters, and the volt and ammeters of the glass-faced type.

The wire chief's room is situated on the first floor directly over the storage battery and cable rooms, and contains, besides the wire chief's desk, the main and intermediate distributing frames, relay racks and power apparatus.

The lines entering the building through the underground cables terminate in groups of terminals corresponding to the number of that particular cable at the main distributing frame. This frame has a present capacity for 6,400 lines, and an immediate equipment for 4,000 lines. Provision has been made for terminating on the switchboard side combined carbon and sneak-current arresters of the Cook type, mounted in strips of 200 pairs each, providing 4,100 pairs of lightning arresters at the present time, one strip of 100 pairs for the toll lines and 20 strips of 200 pairs for the central energy lines. The cable side is equipped with terminals mounted in strips of 25 pairs each, equipped at the present time with 6,000 pairs, providing terminals for 30 200-pair cables. Provision has been made for increasing the main frame by adding additional sections of 800 capacity each whenever desired.

The intermediate distributing frame has a capacity of 6,400 lines and has installed thereon the necessary line and cut-off relays for 4,000 subscribers' lines, enclosed in dust-proof cases, provision being made for adding additional sections of 800 lines each. A special iron frame running from the main frame through a brick shaft conveys the cables to the main switchboard.

The wire chief's desk is situated at the east end of the room, and consists of two positions with the following circuit arrangements for testing:

Incoming desk trunks, 20; desk trunks local to other desks, 20; desk trunks outgoing, 20; test lines to main frame, 10; test plugs to main frame, 10; test plugs to multiple board, 10; multiple test plugs, 10; cable test lines, 20; test cords, 10; Howler cords, 4; order wire circuits, 20; line pilots, 2; ringing pilots, 2; switching keys, 1.

Each of the two positions is provided with a Weston portable volt-ammeter No. 3, with scales 0-150 volts, 0-3 volts and 0-1.5 amperes.

All incoming trunks to the desk terminate at listening keys with associated lamps and are connected with the corresponding outgoing multiple jacks in the main switchboard. Besides the numerous circuits already mentioned there is a 1/6 S. dynamotor, the generator having an output of 100 volts direct current to operate from the 40-volt storage battery to be used in connection with cable and other tests.

The power plant consists of two complete duplicate sets of charging apparatus, each consisting of a 20-h.-p. type "I" 8-pole 60-cycle 3-phase 200-volt alternating current induction motor, direct connected by insulated couplings to a type "H" multipolar generator, delivering an output of 12 k. w., furnishing 200 amperes at 60 volts.

The ringing apparatus consists of 1 type 1 B. R. self-exciting ringing dynamotor belt connected to a 1 h.-p. 4-pole type "I" 200-volt 60-cycle 3-phase full load automatic start alternating motor, the generator having an output of 110 volts alternating and direct current at 110 volts for party line signaling if desired. Also one type 12 T. R. ringing dynamotor.

To the right of the power plant is a 4-panel power board built of white Italian marble. The four panels are mounted on an iron supporting frame and contain the necessary switches, rheostats, volts and ammeters for control of the various circuits.

On the second floor are situated the offices of the company, which occupy the front of the building. They are handsomely furnished, solid mahogany furniture being used in the Directors' room, Managing Director's office, Local Manager's office and General Offices.

The Auditing and Collection departments are on the north side of the building, as is the Legal Department. The locker room is on the south side of this floor, and is used exclusively by the Operating Department. Opening off the locker room are large and attractive dressing and toilet rooms, and adjoining is the dining-room, capable of accommodating a large part of the operating force. Connected with this room are the kitchen and pantry

Digitized by Google

which are fitted up in a first-class manner and in charge of a competent chef.

The main switchboard is situated on the third floor in a room 48 by 98 feet, entirely fireproof, there being no woodwork exposed except the flooring, which is of polished hard wood laid upon a fireproof flooring of six inches of concrete.

Abundance of light and air is provided by means of twelve windows around the three sides of the operating room, besides two ventilating skylights. The ceilings are 25 feet high, supported by three steel columns, around which are grouped the radiators, the entire building being heated by the hot-water system.

The switchboard, manufactured by the Stromberg-Carlson Telephone Mfg. Co., is constructed of highly polished golden oak, special care being used in selecting the wood. It has an ultimate capacity of 12,600 lines, and is equipped for the immediate operation of 4,000 subscribers' lines, distributed in thirty-four operators' positions, with 120 lines to each position.

There are fifteen sections of three operators' positions, each with nine panels in the multiple trunk and answering jack space, arranged as follows: The first position of the first section serves as a multiple annex position. The second and third positions for incoming trunking positions. Each of the remaining positions are wired and equipped complete for 120 lines each.

Each "A" operator's equipment consists of an operator's talking set, including solid back transmitter, head telephone and band attached to an operator's plug, two operator's cut-in jacks wired in multiple and so arranged that when the operator's plug is removed from either jack, the telephone battery circuit is opened.

Each "A" operator's keyboard in use is equipped with fifteen pairs of connecting cords and plugs, double lamp supervisory signals and ringing and listening keys with associated cord apparatus, and ten order wire keys with an ultimate capacity for twenty. Each equipped "A" operator's position has three supervisory pilot lamps mounted in the bar below the answering jacks, one line call pilot, one disconnect supervisory pilot and one ringing supervisory pilot to light when the operator rings, all wired into the night bell circuit.

Below the multiple jacks is space for 360 outgoing trunk jacks in each section, and underneath are mounted the line lamps and answering jacks in strips of ten, there being space for 150 lines, 120 being equipped at the present time, forty in each of the three panels.

There are 60,000 multiple jacks in the present equipment, with space provided for the full ultimate equipment of 12,600 lines. Spring jacks are used with German silver thimbles and individual springs for both tip and sleeve side of the line. The multiple jacks are mounted in strips of twenty, with 3/8-inch centers.

In each of the fifteen sections there are two strips of twenty outgoing jacks connected in multiple for outgoing trunks to the supervisory desks, with designation strips, five to the Chief Operator's desk, fifty to the Information Clerks' desk, five to the Trouble Clerks' desk and five to the Wire Chief's desk.

The supervisory desks of the Chief Operator, Combination, Information and Trouble Clerk and Monitor Operator are standard two-position desks of highly polished quarter sawed golden oak with hinged keyboards.

Steel frames are used for mounting the jacks and lamps, and ample drawer space is provided. File cases are set in each desk for 12,600 cards, and covered by a sliding panel when not in use. Each desk is suitably lighted by overhanging desk brackets. Their equipments are as follows:

Chief Operator's Desk—Incoming trunks, 20 multiplied. Desk trunks, local to other desks, ultimate 20, present 12. Desk trunks, outgoing 20, multiplied. Exchange lines, 10. Cords, 10. Monitor circuit jacks, 120. Order wire keys, 120. Special incoming order wires, 4. Operators' circuits, 2. Pilot lamps, 2. Ringing pilots, 2. Switching keys, 2.

Information and Trouble Clerk's Desk—Incoming trunks, 10; desk trunks, local to other desks, ultimate 20, present 10. Exchange lines, 10. Cords, 10. Observing lines, 10. Operators' sets, 2. Call pilots, 2. Ringing pilots, 2. Switching key, 1.

Monitor's Desk No. 1—Desk trunks, local to other desks, 20. Listening in jacks, 60. Monitor pilots, 60. Supervisory pilots, 60. Monitor keys, 60. Desk cords, 10. Operators' sets, 2. Call pilots, 2. Ringing pilots, 2. Switching key, 1.

Monitor's Desk No. 2—Desk trunks local to other desks, 20. Listening in jacks, 60. Monitor pilots, 60. Supervisory pilots, 60. Monitor keys, 60. Desk cords, 10. Operators' sets, 2. Call pilots, 2. Ringing pilots, 2. Switching keys, 1.

Besides the regular equipment of the Chief Operator's desk are means for making service tests, lighting the subscriber's lamp without signaling the subscriber, circuits for calling subscriber direct from the desks, and testing service from the multiple in connection with outgoing trunks, etc. The Monitor circuits are so arranged that the operators receive no indication of the test being made. Order wire keys connect the switchboard with the various desks. The Trouble Clerk positions are wired and equipped for observation lines, so that when the subscriber calls in the white lamp in front of the observation operator associated with the jack is lit, and also the regular line lamp in the operator's position. This observation lamp remains lit until the operator answers and stays out during the conversation.

The second and third positions of the first section are reserved as "B" positions. Each position is fully equipped with twenty-seven incoming trunks, each consisting of a plug and cord with associated ringing and disconnect supervisory lamp and ringing and listening key.

Located in each section of the switchboard is a push button, connected to a special fire alarm circuit, which is attached to the apparatus at fire headquarters. When the subscriber wishes to summon the Fire Department "Central" is called and informed. The operator pushes the button, which releases the horses, at the same time striking the gong. She then inserts a plug in line No. 19, which action calls Fire Headquarters. The location is announced and the alarm is given. A 6-inch Gamewell fire alarm gong is placed on the second floor. This is connected to the regular fire alarm circuits so that alarms are received at the exchange the same as at the Fire Department. Subscribers can learn of the location of fires within a few seconds after the box is pulled. In connection with the Information Clerk's desk is an Information Bureau. This is maintained day and night and promises to become one of the most popular features of this up-to-date exchange.

The complete and satisfactory manner in which everything was installed reflects credit upon the Stromberg-Carlson Co., and it may well feel proud of its work in connction with the Salt Lake City plant.

THE SITUATION AT OMAHA.

THE Bell Telephone Company, through the medium of its press bureau, is pounding away steadily against the proposition to establish a competing telephone system in the city of Omaha, Neb. Day in and day out, the Omaha *Bee*, which in this fight is the paid spokesman of the Bell interests, publishes articles ranging from one to two columns in length, setting forth the evils that must result to the people of Omaha if the franchise asked by the Independents is granted. These articles appear as usual in the guise of "special correspondence" from other cities. One of the latest specimens in this series of "special correspondence" is dated from Kansas City, Mo. It occupies nearly two columns of space in the *Bee*, and there are about it no indications that the matter is advertising, pure and simple, paid for at special rates by the Bell Telephone Company. It is, perhaps, unnecessary to comment upon the fact that a paper of the standing and position of the *Bee* should wantonly sell its columns to a concern that is notoriously robbing the subscribers of the paper, among others, but it does seem as though a newspaper editor who has had as much to say against the exactions of corporations and the high ideals of government as has the proprietor of the *Bee*, would refrain from deliberately imposing upon the people who support his property. However, that question has come up so often before in other cities and with other newspaper proprietors that it is not worth discussing. The main thing is to point out the deliberate misrepresentations that are made in this so-called "special correspondence."

The editor of THE AMERICAN TELEPHONE JOURNAL, in order to bring the matter squarely to an issue, submitted the article on the alleged situation in Kansas City to Mr. O. C. Snider, vice-president and general manager of the Kansas City Home Telephone Company, and Mr. Snider's reply is given below.

Among other things, the alleged "special correspondent" of the *Bee* had this to say, under a Kansas City date line:

> The Home Telephone Company of Kansas City has an authorized capital stock of $3,000,000, of which $1,700,000 has been issued, the remainder being held in the treasury ostensibly for future "extensions and improvements." The company has bonds outstanding to the amount of $1,700,000, and at *6 per cent.* this indebtedness places an interest charge of $102,000 a year on the company. As near as can be learned the company has in service at Kansas City about *3,500 business 'phones* at $54 each per year, and about *1,500 residence* 'phones at $36 per year each. This would produce a revenue from the local exchange of about $243,000. Allow $57,000 to cover the revenue from toll lines and any underestimate of the local business, and we have a total yearly income of $300,000. According to the annual statement of the Missouri & Kansas Telephone Company, it required 77 per cent. of the revenue from exchange and toll lines to pay the expense of operating and maintenance. To be liberal, estimate the operating and maintenance expense of the Home company at 70 per cent. of its revenue from exchange and toll lines, and the charge will amount to $210,000. The franchise of the new company requires it to pay the city 2 per cent. of its gross receipts, and this makes another charge of $6,000 a year on a business of $300,000. Roughly estimating, therefore, we find the following expenses to be paid from an income of $300,000 a year:

Interest on bonds	$102,000
Operating and maintenance	210,000
Royalty to city	6,000
Total	$318,000

> The new company, which began operations in January last, has about *5,000 subscribers in the city*, while the old company has over 10,000 subscribers, having lost about 900 on account of the competition.
>
> The Home company has toll line connections with less than 200 towns, while the Missouri & Kansas reaches nearly 1,100 towns and cities. It is this immense discrepancy in outside connections that puts the new company at a disadvantage and makes the service of the old company indispensable to a great many business houses.

The foregoing statements are picked out at random from the mass of misinformation contained in this particular article, which, as stated before, is one of a regular series that has been put out in Omaha, as similar series have been put out elsewhere when Independent competition threatened. Discussing these "facts," Mr. Snider writes us:

> I have received your letter of the 1st inst. enclosing clipping from the Omaha *Bee* concerning telephone interests here in Kansas City. The article is a gross misrepresentation of the true condition of affairs here.
>
> In the first place, the financial side of the matter is distorted. The interest on our bonds is $85,000 per year, as the rate is 5 per cent., and not 6 per cent. Furthermore, instead of having 5,000 telephones in service we have more than 9,000. We are not only paying our operating, maintenance, and all fixed charges, but are showing a dividend on our stock.
>
> We are adding new subscribers to our system at the rate of 600 per month, and long before January 1st we will have more than 10,000 telephones in service. Comparing the directories of the two companies, which is a fair basis, we find we have more telephones in service at the present time than the other company. The Bell Telephone Company has lost a great many subscribers, and is doing everything within its power to retain those still in service. It is offering a great many inducements to new subscribers, among them being free service for a period of three months, whereas the Home Telephone Company gives no free service whatsoever.
>
> In the States of Missouri and Kansas the Home Telephone Company has long distance connections with many more telephones than the Bell Company, as in a great many cases our long distance lines connect with exchanges in different towns, whereas the Bell Telephone Company's lines merely have pay stations.
>
> It has been necessary for us to double the capacity of our plant during the past six months in order to provide facilities for our rapidly growing list of subscribers. This is the best evidence of our success, and we are giving no free service.

We commend this matter to the careful attention of those Independent operators who have to meet such methods in their own territory. We doubt that the situation in Omaha will, in the end, be influenced adversely by such tactics. The same sort of campaign has been waged in a great many other places, in fact is being waged in half a dozen different places at this very time, but so far as finally keeping out competition is concerned, the work has invariably failed, as it will fail in Omaha.

AN INSTANCE OF BELL ADVERTISING.

PROBLEM: THE AUTOMATIC VS. THE MANUAL TELEPHONE EXCHANGE.

Paper Presented at The International Electrical Congress at St. Louis,

By Kempster B. Miller.

THERE are two general methods of giving telephone service to a community: *First*—By what is commonly called the "Manual" systems, because of the fact that the switchboards employed at the central office require manual manipulation. *Second*—By the so-called "Automatic" systems, wherein the central office operator is dispensed with, switches being so arranged that they will, without the aid of human hands, perform the necessary act of connecting lines for conversation, and afterwards disconnecting them at the will of the subscribers.

In the manual system in its highest development, the telephone user has only to place his receiver to his ear to make his wants known, the desired connection being made at the central office by operators. This system may be assumed to be highly developed, as it has been almost universally used since the advent of telephony, a period of nearly thirty years. The manual system, in its present form, represents the consecutive work of a large number of men in a field of the most intense and constantly increasing activity, all these men striving for the best possible means of accomplishing a desired result.

In the automatic system, the central office switches are governed in their movements by the action of the subscribers or users who desire connections and subsequent disconnections. The subscriber does his own work, manipulating the apparatus before him in such a way as to cause the switches at the central office to select, connect with, and afterwards disconnect from, the line of the subscriber desired.

Unlike the manual system, the automatic cannot be assumed at the present time to have reached a relatively high development. While the automatic switchboard has been in the minds of inventors since the year 1879, it is not true that it has been put into considerable use until very recently. Instead, therefore, of its development being paramount in the minds of a large number of practical telephone workers, it has been fostered till lately by but few men, some of whom were unfamiliar broadly with the details of the telephone business. With a courage that must excite the admiration of all, a very few of these men have persisted, and, as a result, the telephone engineer, the operator of telephone companies, and last, but most important, the general public are confronted with what I think is the greatest problem that has been recently before the telephone world: The problem of the automatic vs. the manual switchboard.
